B. <u>Introduction</u> In order to help a person, the Case Aide must know and understand the client, including: 1. Who the client is. 2. The kind of problems with which the Case Aide may be helping. 3. The resources available for use in the solution of the problem. 4. What the Case Aide will do <u>with</u> the client and how they will, together, seek a solution to the problem. 5. Evaluate the outcome of this helping activity with his supervisor.	This session can begin with a discussion of the workbook assignment on page 34. What do they need to know about Mrs. Sanchez in order to be of help to her?
C. The Case Aide enables the client to accept and benefit from help through the mutual trust and respect that each develop for the other.	
D. The framework: 1. Identifying the problem: a. Who is your client? Who are his family? Where does he live and under what circumstances?	Use actual examples to illustrate.

b. What is the problem as the client
family sees it; and as his socia
sees it?

c. How has the client tried to hand
problems? How successful was he

d. What strengths and weaknesses wi
client's ability to solve this p

e. What does the client expect of t
the agency?

2. Deciding what should be done?

a. What resources are available to
client himself, his family, his
his community)?

3. A Framework for Helping	Comments, Suggestions
b. What is the problem as the client sees it; as his family sees it; and as his social service worker sees it?	
c. How has the client tried to handle previous such problems? How successful was he?	
d. What strengths and weaknesses will influence the client's ability to solve this problem?	
e. What does the client expect of the Case Aide and the agency?	
2. Deciding what should be done?	
a. What resources are available to help (within the client himself, his family, his neighborhood and his community)?	It is important to clarify that the case aide "does" reflect his concern for the client's more immediate, tangible problems, and that his is not casework practice.
b. Based upon what you know, make a plan of action which you and the client can follow.	
c. Is the client in agreement with this plan?	
d. Does he have the ability to follow such a plan?	
e. Is the plan realistic in terms of available resources, your time, etc.?	
f. Is the plan in agreement with the agency's case plan?	
3. Implementing the plan:	
a. Establish a base of mutual respect and trust.	The material presented in Orientation Session 8 may here be reviewed.

b. Encourage and help the client to ac

(1) Recognize when he and his situa change.

(2) Encourage the client to do wha himself.

(3) First, help him to do something can be successful.

(4) Encourage him in seeking solut immediate, tangible problems wh

(5) Recognize and accept the diffi have participating in the plan

4. Evaluate the outcome of your work with visor.

E. The Concept of Self-Help:

1. A helping person seeks to help people their own problems.

a. He allows them to decide their own

2. How is the technique of Self-Help used

a. Point out alternatives.

b. Offer suggestions rather than defi direction.

3. A Framework for Helping	Comments, Suggestions
b. Encourage and help the client to accept help. (1) Recognize when he and his situation can change. (2) Encourage the client to do what he can himself. (3) First, help him to do something in which he can be successful. (4) Encourage him in seeking solutions to more immediate, tangible problems which he faces. (5) Recognize and accept the difficulty he may have participating in the plan.	The client's right to accept or reject services should also be weighed, as should what the case aide does with the client, be compatible and a part of an overall plan of service.
4. Evaluate the outcome of your work with your supervisor.	
E. <u>The Concept of Self-Help</u>:	
1. A helping person seeks to help people in solving their own problems.	
a. He allows them to decide their own destiny.	
b. He helps them to expand their range of choices.	
c. Through successful problem-solving, he increases their ability to handle future problems.	
2. How is the technique of Self-Help used.	Participants might practice by suggesting the kinds of responses most likely to encourage self-help.
a. Point out alternatives.	
b. Offer suggestions rather than definite direction.

4. Helping as a Case Aide

A. Objective

To compare and contrast the four major ways i
case aides help clients and discuss the proce
such helping can occur.

Socialization: a concept and method of Casework practice for Public Assistance. State of Washington, Department of Public Assistance, May 1969.

B. The Case Aide's ability to help a client will
upon:

1. His ability to build a base of mutual tru
confidence.

2. His ability to communicate clearly and co
with the client.

3. His ability to support positive actions a
havioral changes.

4. His ability to teach - to show and demons
to achieve a specific goal.

5. His ability to focus first upon meeting t
stated need.

C. The major aims of Case Aide activities:

1. To make available to the client, county c
and community resources to meet his needs

"The Socialization of Parents," McBroom, Elizabeth, Child Welfare, Child Welfare League of America, March 1967.

2. To provide opportunities for clients to
to cope more effectively with his enviro

3. To provide a model, through action and e
managing situations in his life which he
unsatisfactory.

4. Helping as a Case Aide

	Comments, Suggestions
A. <u>Objective</u> To compare and contrast the four major ways in which case aides help clients and discuss the process by which such helping can occur. B. <u>The Case Aide's ability to help a client will depend upon:</u> 1. His ability to build a base of mutual trust and confidence. 2. His ability to communicate clearly and concisely with the client. 3. His ability to support positive actions and behavioral changes. 4. His ability to teach - to show and demonstrate how to achieve a specific goal. 5. His ability to focus first upon meeting the client's stated need. C. <u>The major aims of Case Aide activities:</u> 1. To make available to the client, county department and community resources to meet his needs. 2. To provide <u>opportunities</u> for clients to <u>learn</u> how to cope more effectively with his environment. 3. To provide a model, through action and example, for managing situations in his life which he finds unsatisfactory.	Use discussion of Case Aide's experiences to date as a basis for adding detail and examples of what is being taught.

4. To enlarge the client's understanding o over his environment.

D. Questions to be answered:

1. What can be done now to ease the pressu client?

2. What are his choices?

3. Does he know about them?

4. When he knows, does he want to use them

5. Which one(s) does he want to use?

6. After some of the immediate pressures a what other needs might be met?

E. The helping process

1. Establish clear and explicit communicat client.

a. Understand how goals can be achieve county department rules, regulatio cedures.

b. Identify and respond to the client need.

(1) Listen purposefully

(2) Observe what is happening.

(3) Give information needed clearl

(Note: although developed from socialization theory, considerable adaptations for

Comments, Suggestions

4. To enlarge the client's understanding of and control over his environment.

D. Questions to be answered:

1. What can be done now to ease the pressures upon the client?

2. What are his choices?

3. Does he know about them?

4. When he knows, does he want to use them?

5. Which one(s) does he want to use?

6. After some of the immediate pressures are lessened, what other needs might be met?

E. The helping process

1. Establish clear and explicit communication with the client.

a. Understand how goals can be achieved within county department rules, regulations, and procedures.

b. Identify and respond to the client's stated need.

(1) Listen purposefully

(2) Observe what is happening.

(3) Give information needed clearly and honestly

use by Case Aides has been made in this material.)

(4) Find out from the client enc so you understand what he wa expects and how he would lik

2. Agree upon a goal for immediate acti

a. Determine with the client who wi when and how it is to be done.

b. Be sure that the client understa upon the goal to be undertaken.

3. Direct helping activity:

a. Material and concrete assistance

(1) Focuses upon meeting the cli needs first.

(2) A tangible way of demonstrat to help.

(3) Involves providing for and w with emphasis upon your mutu to work together.

(a) May involve doing for th tacting a landlord, the agency, etc.) at first.

b. Acting as a model-teacher:

(1) Displaying (in his dealings those kinds of behavior and problem-solving.

Comments, Suggestions

(4) Find out from the client enough information so you understand what he wants, what he expects and how he would like to proceed.

2. Agree upon a goal for immediate action.

a. Determine with the client who will do what, when and how it is to be done.

b. Be sure that the client understands and agrees upon the goal to be undertaken.

3. Direct helping activity:

a. Material and concrete assistance:

(1) Focuses upon meeting the client's material needs first.

(2) A tangible way of demonstrating your desire to help.

(3) Involves providing <u>for</u> and <u>with</u> the client with emphasis upon your mutual responsibility to work together.

(a) May involve doing <u>for</u> the client (contacting a landlord, the school, another agency, etc.) at first.

b. Acting as a model-teacher:

(1) Displaying (in his dealings with the client) those kinds of behavior and methods used in problem-solving.

Summarize the various examples on page 36 of the workbook as a basis for discussing the four major ways in which a case aide helps clients.

(2) Teach through actions and examples, w
managing situations which are threate
prevent family functioning.

(3) Utilize the Case Aide's unique skills
specific problem-solving endeavors as
his understanding and use of various
agency resources.

c. Supporting positive client actions:

(1) Requires recognition of the client's
strengths and his efforts at problem-
solving.

(2) Complimenting the client on his achie
(commenting on his efforts to clean h
house, to keep medical appointments,

(3) Accentuating the positive:

d. Providing information about and helping t
resources available to the client and, in
situations, providing specific resources
supplies.

(1) Direct provision of material items (s
times from supplies maintained by age

(2) Using knowledge of agency to be sure
client receives what he is eligible t
receive.

(3) Developing and finding new resources
coordinating their use by clients.

15522

Comments, Suggestions

(2) Teach through actions and examples, ways of managing situations which are threatening or prevent family functioning.

(3) Utilize the Case Aide's unique skills in specific problem-solving endeavors as well as his understanding and use of various social agency resources.

c. Supporting positive client actions:

(1) Requires recognition of the client's strengths and his efforts at problem-solving.

(2) Complimenting the client on his achievements (commenting on his efforts to clean his house, to keep medical appointments, etc.)

(3) Accentuating the positive:

d. Providing information about and helping to use resources available to the client and, in some situations, providing specific resources or supplies.

(1) Direct provision of material items (sometimes from supplies maintained by agency.)

(2) Using knowledge of agency to be sure that client receives what he is eligible to receive.

(3) Developing and finding new resources and coordinating their use by clients.

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: IV. ELECTRICAL SYSTEM

MILESTONE: IX. LIGHTING - TAIL, STOP, & SIGNAL

PERFORMANCE OBJECTIVE NO.: 9 TITLE: Remove, Test, and Replace Light Bulbs

CONDITIONS:

This assignment is to performed on a complete automobile.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Remove tail light lens following steps as outlined in manual
6. Remove bulbs by pushing in and turning - Bulb will align with slots and can be pulled from socket
7. Make tests and checks as outlined in the manual
8. Install bulb
9. Make necessary tests and checks following steps as outlined in manual
10. If all tests and checks are satisfactory, install tail light lenses as outlined in manual
11. Recheck lights and if still satisfactory, return tools and materials to proper place

PERFORMANCE CRITERIA:

1548

Comments, Suggestions

(4) Performing activities within social welfare principles and helping concepts.

F. Strengthening the base of mutual trust and acceptance

1. The need to view each client contact as a base for future contacts.

2. To support the "team concept" - the helping roles of others in the agency with whom the client works.

3. Specific ways of building trust

(a) Individualization

(b) Acceptance of client as a person of worth.

(c) Responding to stated need.

(d) Understanding the client's point of view.

(e) Nonjudgemental.

(f) To determine his own future and choose what he is to do.

(g) Respecting what he says - Confidentiality.

G. Periodic review of progress with your supervisor and the sharing of pertinent information with other team members

H. Discussion of examples from Case Aide's assignments

Ask participants to complete the assignment on page 38 of their workbook, in preparation for their next session.

7. Helping a Client to Use a Resour

A. Objective

To identify and discuss the steps involved in
client to use a community resource and the va
in which this is accomplished.

B. The purpose in using a resource

To bring together a person with a specific ne
agency, institution or other resource, capabl
that need.

1. Using a resource may involve writing a le
agency informing them of the need of a pa
client.

2. It may involve a telephone call to anothe
and to a client, directing each to the ot

3. It may involve taking a client to some ag
resource, and showing him how to use it.

C. Whatever method is used, it should reflect th
considerations:

1. It should be fast enough to meet the need
specific client, avoiding undo delay.

2. It should be personal enough to assure th
client will be comfortable in using the r

3. It should be simple enough so that the cl
understand how he can use the resource an
will have sufficient information about th
in order to help him.

7. Helping a Client to Use a Resource

Comments, Suggestions

A. <u>Objective</u>

To identify and discuss the steps involved in helping a client to use a community resource and the various ways in which this is accomplished.

B. <u>The purpose in using a resource</u>

To bring together a person with a specific need and an agency, institution or other resource, capable of meeting that need.

1. Using a resource may involve writing a letter to an agency informing them of the need of a particular client.

2. It may involve a telephone call to another agency and to a client, directing each to the other.

3. It may involve taking a client to some agency or resource, and showing him how to use it.

C. <u>Whatever method is used, it should reflect the following considerations:</u>

1. It should be fast enough to meet the need of the specific client, avoiding undo delay.

2. It should be personal enough to assure that the client will be comfortable in using the resource.

3. It should be simple enough so that the client will understand how he can use the resource and the agency will have sufficient information about the client in order to help him.

A brief presentation, describing the kinds of agencies and/or resources that case aides will be helping clients to use can serve as a basis for discussion of the steps usually taken in helping clients to use a community resource.

4. It should be planned sufficiently to as meeting of the client's need.

D. When is another resource used?

1. Whenever the county welfare department vide the services needed by the client specific problem.

2. Whenever the resource being used prefer procedures be used in directing people services.

3. Whenever the client would prefer agency tacting a potential resource.

E. The steps to be taken in using a resource

1. Determine whether a specific need exist client, and if he wishes help in using

2. Can the client meet this need? Can the this need? If not, is there another ag resource who can meet this need.

3. Determine the requirements of the agenc the client will be referred and whether eligible to obtain their help.

4. Determine how to best help the client c use the resource.

5. Clear with the source for a specific t place where the client can seek their h possible obtain the name of the person the client will speak.

Comments, Suggestions

4. It should be planned sufficiently to assure a prompt meeting of the client's need.

D. When is another resource used?

1. Whenever the county welfare department does not provide the services needed by the client to meet his specific problem.

2. Whenever the resource being used prefers specific procedures be used in directing people to its services.

3. Whenever the client would prefer agency help in contacting a potential resource.

E. The steps to be taken in using a resource

1. Determine whether a specific need exists for the client, and if he wishes help in using a resource.

2. Can the client meet this need? Can the agency meet this need? If not, is there another agency or resource who can meet this need.

3. Determine the requirements of the agency and to whom the client will be referred and whether he would be eligible to obtain their help.

4. Determine how to best help the client contact and use the resource.

5. Clear with the source for a specific time, date and place where the client can seek their help. If possible obtain the name of the person with whom the client will speak.

Through discussion of examples, participants should be encouraged to identify these steps. Review the workbook assignment on page 44, as a basis for discussing what next steps a case aide might take.

6. Find out if the time is convenien and determine help he may need in appointment.

7. Provide the client with specific needs and be sure that he underst what way that the resource will h

8. Find out whether the client has t that he understands where to go.

9. If his appointment is in the futu client of the appointment a few d go.

F. What should the case aide do after us

1. The Case Aide assumes responsibil its use by and benefit to the cli

2. Find out whether the client was a appointment.

3. If appointment was not kept (and try to eliminate the reason for h keep the last appointment.

4. If the resource was contacted by out if the need continues and the the resource was able to help the

5. If the client will continue conta source, is there anything you can benefit for the client.

Comments, Suggestions

6. Find out if the time is convenient for the client and determine help he may need in keeping the appointment.

7. Provide the client with specific instructions he needs and be sure that he understands how and in what way that the resource will help him.

8. Find out whether the client has transportation and that he understands where to go.

9. If his appointment is in the future, remind the client of the appointment a few days before he is to go.

F. <u>What should the case aide do after using a resource?</u>

1. The Case Aide assumes responsibility for assessing its use by and benefit to the client.

2. Find out whether the client was able to keep his appointment.

3. If appointment was not kept (and need continued) try to eliminate the reason for his inability to keep the last appointment.

4. If the resource was contacted by the client, find out if the need continues and the extent to which the resource was able to help the client.

5. If the client will continue contacts with the resource, is there anything you can do to maximize its benefit for the client.

6. What, if any, next steps might be taken.

Have participants practice various steps to take in helping a client use a resource by considering a specific case situation and deciding what they would do in this specific situation.

8. Planned Visits to Community Resource

A. Objective

To identify and discuss community resources avai
clients, when the specific resource would be use
how he can help clients to use it.

B. Suggested guidelines in planning visits to commu
resources

The purpose of this session is to provide case a
with the opportunity to visit several community
available for clients. Those selected for a vis
should be representative of major community resc
used by clients. Participants should be asked t
identify the following information on their visi

1. What is the resource?

2. To whom and under what circumstances can it

3. In what ways does it help people?

4. What methods of help are used?

5. How does the resources prefer to have a ref
made?

An opportunity for discussion and assessment of
possible use of each resource visited should be
following these visits.

8. Planned Visits to Community Resources

9. Poverty: Its Causes and Effects

Comments, Suggestions

y in the
asie, Robert
ds.
r Social
ncy Preven-
n Studies
s, Ca., 1964

A. Objective

To identify major causes of poverty and discuss how he, as a case aide, can help to lessen its effect upon clients.

B. Some definitions

1. Poverty is a condition of being in which one's past and future meet in the present - and go no further. (Ira Goldenberg)

2. A member of a four-person family with a total annual income of not more than $2,500. (Joint Economic Committee of Congress)

C. The nature of poverty

1. A design of living which influences a person's perceptions of the world around him.

2. It has its own styles and distinctive social and psychological consequences.

3. One must distinquish between impoverishment and being caught in a cycle of poverty.

D. Poverty can be influenced by:

1. Income:

a. The level of income.

b. The stability or regularity of income.

c. The source of income (employment or welfare).

This session can begin by discussing the workbook assignment on page 48, and the various perceptions of poverty offered in these quotations.

References	
	2. Feelings and attitudes: a. Marginality. b. Helplessness. c. Dependency. d. Not belonging. 3. Environmental conditions E. Characteristics of poverty: 1. Economic: a. A constant struggle for survival. b. Unemployment and underemployment c. Marginal income. d. Absence of savings. e. A chronic shortage of cash. f. The absence of food reserves in the home. g. Borrowing at high rates of interest.
About The Poor: Some Facts and Some Fictions. Herzog, Elizabeth, U. S. D.H.E.W., Social and Rehabilitation Service, Children's Bureau, Washington, D.C., 1967.	

Comments, Suggestions

2. Feelings and attitudes:

   a. Marginality.

   b. Helplessness.

   c. Dependency.

   d. Not belonging.

3. Environmental conditions

Additional characteristics should be added by participants.

E. Characteristics of poverty:

1. Economic:

   a. A constant struggle for survival.

   b. Unemployment and underemployment

   c. Marginal income.

   d. Absence of savings.

   e. A chronic shortage of cash.

   f. The absence of food reserves in the home.

   g. Borrowing at high rates of interest.

The Other American: Poverty in the United States. Harrington, Michael, Penguin Books, 1964.

2. Some social and psychological character

   a. Living in crowded quarters.

   b. A lack of privacy.

   c. More frequent resort to violence in of quarrels.

   d. An increase in one-parent families.

   e. Emphasis upon family solidarity - a rarely achieved.

   f. Present time orientation.

   g. Authoritarianism

   h. A sense of resignation and fatalism the realities of the life situation

   i. A belief that existing institutions their interests and needs.

F. The cycle of poverty: (one example):

   1. The poor become sick more often because live under unhygienic conditions.

   2. They are more likely to remain sick lon they lack money for medical care, an a balanced diet, confidence in physicians standing of their medical needs.

   3. As a result, they are less capable of the next time around.

Comments, Suggestions

2. Some social and psychological characteristics:

   a. Living in crowded quarters.

   b. A lack of privacy.

   c. More frequent resort to violence in the settling of quarrels.

   d. An increase in one-parent families.

   e. Emphasis upon family solidarity - an ideal rarely achieved.

   f. Present time orientation.

   g. Authoritarianism

   h. A sense of resignation and fatalism based upon the realities of the life situation.

   i. A belief that existing institutions do not serve their interests and needs.

F. The cycle of poverty: (one example):

   1. The poor become sick more often because they may live under unhygienic conditions.

   2. They are more likely to remain sick longer, because they lack money for medical care, an adequate, balanced diet, confidence in physicians, and understanding of their medical needs.

   3. As a result, they are less capable of facing illness the next time around.

Additional examples of the vicious circle which the poor frequently find themselves caught in, can be developed by the group. Ask questions like: What effect will such an environment have on children? What kind of persons are they likely to become?

G. The implications of "a cycle of poverty" for wh
Case Aide does:

1. The Case Aide will want to be concerned wi
economic, social, and psychological factors
influence families. (Helen Harris Perlman
"Man cannot live by bread alone, but he ca
by guidance and counseling alone either."
concern must be sought.)

2. One important way of breaking the cycle of
is to help people to want and to seek new

3. The Case Aide will help interpret the inte
needs of clients.

4. Wherever possible, the Case Aide will want
the energy which clients must devote to su
constantly trying to "make do" with string
rope is needed - by bringing the client to
resources that can help him.

H. Some principles of helping:

1. Clients need a Case Aide who will encourag
try, to hope, to believe in their futures,
selves and in their abilities.

2. A Case Aide who will try to understand the
and the culture within which he lives.

3. A Case Aide's ability to help will be base
her feelings towards the client. They mu
trust and faith in each other.

Comments, Suggestions

G. The implications of "a cycle of poverty" for what a Case Aide does:

1. The Case Aide will want to be concerned with the economic, social, and psychological factors which influence families. (Helen Harris Perlman has said: "Man cannot live by bread alone, but he cannot live by guidance and counseling alone either." A balanced concern must be sought.)

2. One important way of breaking the cycle of poverty is to help people to want and to seek new goals.

3. The Case Aide will help interpret the interest and needs of clients.

4. Wherever possible, the Case Aide will want to lessen the energy which clients must devote to survival - constantly trying to "make do" with string where rope is needed - by bringing the client together with resources that can help him.

H. Some principles of helping:

Discussion might be stimulated by asking the question, "In what ways might a case aide help clients caught in a cycle of poverty?"

1. Clients need a Case Aide who will encourage them to try, to hope, to believe in their futures, in themselves and in their abilities.

2. A Case Aide who will try to understand the client and the culture within which he lives.

3. A Case Aide's ability to help will be based upon her feelings towards the client. They must have trust and faith in each other.

4. A Case Aide will want to learn the difference in perceptions by which he and the client view things.

5. The degree to which the client can undertake new action and accept new goals will depend upon and be influenced by his family and friends.

6. A Case Aide can serve as a model - an example of one person who is succeeding.

	Comments, Suggestions
4. A Case Aide will want to learn the difference in perceptions by which he and the client view things.	
5. The degree to which the client can undertake new action and accept new goals will depend upon and be influenced by his family and friends.	
6. A Case Aide can serve as a model - an example of one person who is succeeding.	Ask participants to complete the workbook assignment on pages 51 and 52, in preparation for their next session.

10. Some Myths About Public Welfare and its Clients

A. Objectives

To identify common myths abut public welfare and its clients, and clarify the reasons for these misconceptions.

B. Some Examples of Common Myths

1. Most recipients could work if they only had the ambition to do so.

   a. About 90% of the persons receiving public assistance are unable to work.

   b. Aged, blind, disabled and children.

2. Fathers in AFDC-U families should be forced to work and support their families.

   a. Unemployed fathers are required to register for employment.

   b. They frequently face many problems in finding employment (lack of education, discrimination, lack of skills, etc.).

   c. Even when employed, not all men can earn an income which is adequate to support their family.

3. Public welfare grants provide an adequate income for families.

   a. Such grants rarely reflect more recent rises in cost of living.

   b. Not all items considered "essential" by individuals will be included in such a grant.

10. Some Myths About Public Welfare and its Clients

Comments, Suggestions

A. Objectives

To identify common myths abut public welfare and its clients, and clarify the reasons for these misconceptions

Have the participants read and discuss the workbook assignment on pages 51 and 52. Through discussion other myths can be identified.

B. Some Examples of Common Myths

1. Most recipients could work if they only had the ambition to do so.

   a. About 90% of the persons receiving public assistance are unable to work.

   b. Aged, blind, disabled and children.

2. Fathers in AFDC-U families should be forced to work and support their families.

   a. Unemployed fathers are required to register for employment.

   b. They frequently face many problems in finding employment (lack of education, discrimination, lack of skills, etc.).

   c. Even when employed, not all men can earn an income which is adequate to support their family.

Encourage participants to develop their own answers to these myths, where this is possible. The learning group itself can be used in clarifying misconceptions on the part of participants.

3. Public welfare grants provide an adequate income for families.

   a. Such grants rarely reflect more recent rises in cost of living.

   b. Not all items considered "essential" by individuals will be included in such a grant.

c. Public welfare grants do not provide f
pected emergencies.

d. Even the most skilled of homemakers wo
difficult, at times, to manage on such

4. People who receive welfare grant spend the
foolishly.

a. Many recipients are very skilled at ma
their welfare grant.

b. Some lack the skills needed for carefu
budgeting, etc. The agency is concern
helping them to develop such skills.

c. Differences exist in how we each perce
important.

5. Most people on public assistance lie about
sources of income they receive and therefo
guilty of fraud.

a. Administrative error is one reason why
are sometimes not correctly figured.

b. Some clients, because of their lack of
about assistance, actually receive les
they are eligible for.

c. Some clients do not understand that th
report income, nor do they know that t
will allow them to keep some of this i
before subtracting the remainder from
grant. This is an important area in w
Case Aide can help them.

Comments, Suggestions

c. Public welfare grants do not provide for unexpected emergencies.

d. Even the most skilled of homemakers would find it difficult, at times, to manage on such a grant.

4. People who receive welfare grant spend their money foolishly.

   a. Many recipients are very skilled at managing on their welfare grant.

   b. Some lack the skills needed for careful shopping, budgeting, etc. The agency is concerned with helping them to develop such skills.

   c. Differences exist in how we each perceive what is important.

5. Most people on public assistance lie about other sources of income they receive and therefore are guilty of fraud.

   a. Administrative error is one reason why grants are sometimes not correctly figured.

   b. Some clients, because of their lack of knowledge about assistance, actually receive less than they are eligible for.

   c. Some clients do not understand that they are to report income, nor do they know that the agency will allow them to keep some of this income before subtracting the remainder from their grant. This is an important area in which a Case Aide can help them.

6. The majority of children on AFDC are illegitimate.

   a. The majority of children are not illegitimate.

   b. Those who are need the special help of the agency.

7. If welfare checks were kept as low as possible, this would force clients to find other means of supporting themselves.

   a. The majority of people on assistance are incapable of working or finding a means of support beyond what they currently have.

   b. Helping people becomes almost impossible when they are subject to severe economic deprivation.

   c. Low assistance grants keep people on assistance by providing no way to escape through training, having adequate clothing to find a job, etc.

8. Welfare mothers frequently have more children in order to boost their grant.

   a. The amount of increase received in a grant with an additional child is always less than what it will cost to raise that child.

   b. In some cases, the addition of a child can mean even more deprivation for the rest of the family.

   c. Not all welfare mothers know about the ways available to them to plan when to have a child and to avoid having a child when they do not want one.

Ask participants t
workbook assignmer

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: V. ENGINE

MILESTONE: I. ENGINE OVERHAUL

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Disassemble, Check, Make Measurements, and Reassemble Engine

CONDITIONS:

Operations are to be performed on a live engine mounted on a stand. This operation requires removal of engine from stand to a universal work stand for certain phases of disassembly ans reassembly.

BEHAVIOR:

After satisfactory compltеion of all related training, proceed as follows:

1. Select proper manual and turn to appropiate chapter
2. Obtain engine specifications sheet from instructor
3. Select proper tools and materials
4. Move parts rack to area and position in a convenient location but in a location which would not obstruct free movement in the shop. Store all parts in a neat, orderly manner.
5. Start engine
6. Determine engine condition by following all steps as outlined in the manual
7. Fill out first section of specification sheet
8. Disconnect and remove battery - store battery on battery rack
9. Drain radiator and engine block
10. Remove radiator base clamp and remove radiator hoses - store on rack

PERFORMANCE CRITERIA:

1552

11. Nutrition

Comments, Suggestions

A. Objective

To identify the major grouping of food sources needed in a balanced diet, and discuss those factors which influence what and how much a person eats.

B. Some definitions:

1. Food: Any nourishing substance that is eaten to sustain life, provide energy, promote growth, etc.

2. Nutrition: The study of what people eat in order to sustain life, provide energy, promote growth, etc.

3. Diet: Food considered in terms of its qualities, composition and its effect upon health.

C. Factors which affect a person's perceptions of what he eats

1. Economics: the amount of money available for purchasing food.

2. Food supply: Where, in what form and under what circumstances food is obtained.

3. Customs: religious and cultural influences upon what a person can eat, "should eat", and the way in which it is prepared.

4. Social: the environment in which a person prepares food and eats, those with whom he eats, etc.

A home economist or staff member with such an educational background might be an appropriate person to teach this session.

Encourage participants to share their knowledge of nutrition and use their terms, while trying to eliminate misunderstandings or misconceptions.

(A large variety of publications on skillful buying are available for use.)

Sidney Margolious. How to Make the Most of Your Money. Meredith Press, New York, 1966.

A. Objective

To identify and discuss principles of food
these can be used in helping clients.

B. Factors which influence meal planning:

1. Likes and dislikes.
2. Meals which members eat away.
3. Food budget.
4. Food storage facilities.
5. Buying practices.
6. Special diets.
7. Range of foods used.
8. Resources for food preparation.
9. Sanitation.

C. A knowledge of nutrition is a first step
food expenses for a family

1. Many clients have a knowledge of low-c
methods but may misunderstand how nutr
shopping must play a part in planning

2. Some people believe that some low-cost
margarine, dry nonfat milk or lower g
not as nutritious.

15572

12. Meal Planning and Buying

	Comments, Suggestions
A. <u>Objective</u> To identify and discuss principles of food buying and how these can be used in helping clients.	
B. <u>Factors which influence meal planning:</u> 1. Likes and dislikes. 2. Meals which members eat away. 3. Food budget. 4. Food storage facilities. 5. Buying practices. 6. Special diets. 7. Range of foods used. 8. Resources for food preparation. 9. Sanitation.	This session can begin with a discussion of the workbook assignment on page 57 and participant experiences in completing this. Did they learn anything that was not previously known?
C. <u>A knowledge of nutrition is a first step in lessening food expenses for a family</u> 1. Many clients have a knowledge of low-cost cooking methods but may misunderstand how nutrition and shopping must play a part in planning. 2. Some people believe that some low-cost foods like margarine, dry nonfat milk or lower grade meats are not as nutritious.	Encourage Case Aides to identify specific skills they have developed and to generalize these so as to maximize their use in a variety of client situations.

15572

15573

3. Planful shopping cannot be done quickly - it wil take some time and planning.

D. One way of planning meals and buying:

1. Plan meals around specials.

a. Read newspaper ads and plan your meals aroun each week's specials. Compare specials offe by several stores.

b. Meat is the item most often featured and you largest food expense. Start with this item.

c. Specials offer reductions, on the average, o

d. Other frequently listing feature items can a secured. (Canned and packaged products, cof soaps, etc.)

e. Plan your menus before you shop, not afterwa Modifications can later be made but pre-plan will help you to not forget items you will b needing.

2. Buy according to nutritive value.

a. Some foods which seem inexpensive are not, i were to measure their nutritional value.

b. People frequently use cold cuts or frankfurt in the belief that these are cheap. From a nutritious point of view, these are much mor costly than regular meat.

12. Remove air breather assembly and dtore on rack. (Note: All parts other than radiator will be neatly stored on rack)
13. Remove fuel lines
14. Remove fuel pump
15. Remove carburetor
16. Remove secondary wires
17. Remove primary ignition wires
18. Remove distributor
19. Remove generator and bracket
20. Remove starting motor
21. Remove rocker arm covers
22. Remove intake manifold dollowing steps as outlined in manual
23. Remove rocker arms and push rods following steps as outlined in the manual

PERFORMANCE CRITERIA:

Comments, Suggesitons

3. Planful shopping cannot be done quickly - it will take some time and planning.

D. <u>One way of planning meals and buying:</u>

1. Plan meals around specials.

a. Read newspaper ads and plan your meals around each week's specials. Compare specials offered by several stores.

b. Meat is the item most often featured and your largest food expense. Start with this item.

c. Specials offer reductions, on the average, of 20%.

d. Other frequently listing feature items can also be secured. (Canned and packaged products, coffee, soaps, etc.)

e. Plan your menus before you shop, not afterwards. Modifications can later be made but pre-planning will help you to not forget items you will be needing.

2. Buy according to nutritive value.

a. Some foods which seem inexpensive are not, if one were to measure their nutritional value.

b. People frequently use cold cuts or frankfurters in the belief that these are cheap. From a nutritious point of view, these are much more costly than regular meat.

These notes contain some of the more common shopping principles used.

A study of calorie count for various items is one way of viewing nutritional value.

c. Home-cooked items tend to be less costly for sandwiches and lunches than are cold cuts and prepared luncheon items available for purchas

3. Buy the lowest suitable grade.

a. Lower grade items have the same nutritional value. Grade A items are usually selected fo their size and shape over grades B and C, not their food value.

b. Meats are usually graded according to "Choice "Good" and "Standard." The amount and type o fat usually determines the grade, although ea can be tender.

4. Read the ingredients.

a. Check the list of ingredients each package is required to carry.

b. On prepared foods where no standard has been set, the label must list the ingredients in t order of their amount. (the first example represents the most nutritious buy. It conta the most meat).

For example, one can of beef stew can read:

"beef, potatoes, tomatoes," etc.

A second brand can read:

"beef, water, potatoes", etc.

A third brand can read:

[redacted] beef, potatoes", etc. [redacted]

		Comments, Suggestions
to Crest	A. <u>Objective</u> To identify principles of household management and discuss specific ways in which they can help clients with management problems. B. <u>As much as it is possible, plan your schedule</u> 1. Begin with that day you do your food shopping. This will be on the day in which weekly "specials" appear in your newspaper. 2. List the other major cleaning and household, planning one or two major tasks each day (ironing, cleaning, washing, etc.). 3. Be sure to plan around other non-housekeeping activities you may have. C. <u>Organize your home in a manner which you understand and find useful</u> 1. Arrange your kitchen shelves by alphabet (A for applesauce to Z for zucchini) or by color (Red for meat to Green for spinach). 2. In cleaning, don't cover things up unless it's absolutely necessary. It will just mean you have two things to clean the next time around. 3. Each time you clean, start with a different room. 4. Set up a clutter depot. 5. Establish one permanent place in your home for leaving messages.	Group discussion Participants should be encouraged to carry major responsibility for planning and carrying this session. The content offered lists one approach to household management. There are many other approaches which can work equally well. The group should use this session to identify and share their own ideas. The leader can help to generalize specific examples for possible wider use with a variety of clients. Thus, the major purpose of this session is to identify what they already know and how they can use this with clients.

15. Principles of Child and Child Rear

Witmen and Kotinsky, Personality in The Making.

A. Objective

To identify some of the major developmental a ments of children and discuss how principles development can be used in work with clients.

B. The Family:

"a unit composed not only of a child, but of an occasional animal and a common cold." (Ogc

1. To produce children and provide them with of supporting affection.

2. To induct them, from infancy on, into the values of their culture and of society.

3. To give them their initial identity withi community.

C. Some principles of child development and chil inuluence the helping services

1. The family is the most significant single in the development of the child.

2. The child's basic attitudes are formed pr within the family.

3. A significant function of the family is t the child with acceptance and value produ confidence.

4. Parental training is not made effective m the setting of high standards.

15. Principles of Child and Child Rearing

Comments, Suggestions

A. Objective

To identify some of the major developmental accomplishments of children and discuss how principles of child development can be used in work with clients.

B. The Family:

"a unit composed not only of a child, but of men, women, an occasional animal and a common cold." (Ogden Nash)

1. To produce children and provide them with a setting of supporting affection.

2. To induct them, from infancy on, into the ways and values of their culture and of society.

3. To give them their initial identity within the community.

C. Some principles of child development and child care which inuluence the helping services

1. The family is the most significant single influence in the development of the child.

2. The child's basic attitudes are formed principally within the family.

3. A significant function of the family is to provide the child with acceptance and value producing self-confidence.

4. Parental training is not made effective merely by the setting of high standards.

A discussion of the workbook assignment on pages 63 and 64, and the reasons why participants answered these questions as they have, can serve as a basis for identifying principles of child development. List these on the blackboard as they are identified for later group reference and use.

8. Work with specific minority groups.
9. Educational games for children.
10. Participation in client groups.

17. through 22. Suggestions for Content	Comments, Suggestions
Six sessions, covering a period of twelve hours, will need to be added by the county department in completing the induction training of new Case Aides. The trainer will want to select content needed by the Case Aides in their specific job assignment, and these six sessions have been left open for content covering the more unique uses of Case Aides in individual county departments which cannot be anticipated. Some of the particular content areas to be covered might include the following: 1. The development of new community or neighborhood resources. 2. The special needs of older clients, the handicapped, or children. 3. The use of specific forms. 4. More detailed information on eligibility requirements. 5. Assessing the suitability of housing. 6. The use of surplus foods. 7. The location and recruitment of clients. 8. Work with specific minority groups. 9. Educational games for children. 10. Participation in client groups.

23. A Review and Evaluation of Induction Training Sessions

	Comments, Suggestions
A. A summary and review of material covered in induction training sessions.	
B. Group evaluation of the induction training sessions: 1. Group Task: Evaluate induction training and make recommendations which the group thinks are important.	Group evaluation can be done through an open discussion with the trainer. Another approach which can be used is to ask the group to select its own leader and, as a group, to evaluate induction training they have now completed. Allow at least 30 minutes to seek group consensus and ask that notes on recommendations be kept and turned into the trainer.
C. Written evaluation and assessment of training.	Ask the participants to complete the evaluation form in their workbooks on pages 65 through 68.

HE TRAINING, EMPLOYMENT AND USE OF PREPROFESSIONALS IN THE HUMAN SERVICES

t T. and Briggs, Thomas L., Differential Use of Social Work Manpower: An Analysis
tion Study. National Association of Social Workers, New York, 1968.

s the nature of the manpower crisis, the extent of the problem, its effect
rofession and clients served, and alternative courses of action. The authors
an analytical framework within which the profession can proceed to more
t manpower utilization, and describes a study demonstrating the use of a team
in the delivery of social services to clients.

d and O'Reilly, Charles, "What About the Manpower Crisis in Social Welfare?"
e, The Journal of the American Public Welfare Association, Vol. XXVII, No. 4,
).

r discusses the need for a manpower pool of many different levels of education and
, so that each can use his talents and abilities fully and appropriately.

tin L.; Harm, Mary G.; and Ortof, Selma B.; The Content for Training in Project
d Study Association of America, New York, 1967.

ument is the result of efforts to develop a model curriculum from the experiences
ing, learning and program implementation in Project ENABLE. The material may be
revised, adapted or developed in further training programs directed toward the use
education as a means of involving parents in community and institutional improve-
d change. The syllabus represents narrative condensation of the major teaching
in national and regional institutes and in supervision of local programs.

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG, VIRGINIA FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: V. ENGINE

MILESTONE: I. ENGINE OVERHAUL

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Disassemble, Check, Make Measurements, and Reassemble Engine

CONDITIONS:

BEHAVIOR:

59. Connect battery cables following steps outlined in the manual - observe polarity
60. Re-check steps to make sure none have been omitted
61. Start engine and run at speed and length of time specified in the manual
62. Make all tests, checks, and adjustments as outlined in the manual
63. Stop engine
64. Re-torque bolts
65. Start engine and run until temperature is stabilized
66. Re-adjust valves as outlined in the manual
67. Adjust carbureter
68. Stop engine and fill out balance of specifications sheet
69. Install air breather and other accessories
70. Start engine
71. If engine meets tests and performs satisfactorily, return all tools, materials, test equipment, parts rack, etc., to proper storage places
72. Clean area for next project

PERFORMANCE CRITERIA:

To be able to disassemble, check, make measurements, and reassemble engine in 15 hours

Learning time: 35 hours

/ PERFORMANCE OBJECTIVE STATEMENT /

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: V. ENGINE

MILESTONE: II. VALVE GRINDING & REFACING

PERFORMANCE OBJECTIVE NO.: 2 TITLE: Reface Valves and Grind Seats

CONDITIONS:

Operation is to be performed on cylinder head obtained from store room. Occasionally this operation is performed on a live engine.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Obtain one cylinder head from the parts room
2. Select proper manual and turn to appropiate chapter
3. Obtain from the instructor the operating instructions for the grinding equipment to be used
4. Select proper tools and equipment
5. Remove all valves from cylinder head following steps as outlined in the manual
6. Remove all deposits from combustion chambers, valve parts, and valves
7. Make all tests and checks as outlined in the manual
8. Using the instruction book and with the assistance of the instructor, set up valve grinding equipment
9. After demonstration on 1st valve by instructor, grind remaining valves
10. After demonstration on 1st valve seat, grind remaining seats

PERFORMANCE CRITERIA:

PREFACE

One Case Aide, speaking for her class of trainees at their graduation said:

> "On February 3, 1967, at 8:30 a.m., we five women met for the first time. Nervous, apprehensive, not really knowing what to expect or what was expected of us. We felt like five squares in a world full of circles. Our one common bond was the burning desire to be free; free of public assistance, of social workers, of the rules and regulations governing our lives.
>
> "It was a way out, the ... weeks ahead were simply to be gotten through, the price we must pay for that precious freedom. These were our thoughts.
>
> "I can truly speak for all of us when I say it took only one day, one day to realize that we couldn't have been more mistaken. This was not something meant just to make us self-supporting and thus cutting down the State's expense. We were needed, and for some of us it was the first time we had felt needed outside our families for a long time. The social workers needed us. The clients needed us."[1/]

Yes, you are needed as members of a very important team - one that you will be learning more about in the coming weeks. But, before we discuss the part you will play on this team, a very sincere and special welcome. We are glad that you have chosen to join us as an employee of this county welfare department.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

INTRODUCTION

This workbook is designed to help you in your new job as a Case Aide in this county welfare department. You are now about to begin a period of orientation and induction training that will continue through your third month of employment. We don't expect you to arrive on this, your first day of work, capable of performing your new job. No one can begin a Case Aide job with such knowledge. This is why we have planned a series of training sessions - so that you will have the opportunity to learn how to do your new job and what is expected of you as an employee in the county welfare department.

Orientation Training

Beginning today, you will start a one-week period of orientation to the county welfare department and to your new job assignment. During this week, you will have an opportunity to begin learning about the agency and enough about its operation in order to begin your job. You will also have an opportunity to observe more experienced staff work with clients. Thus, you will be able to see how experienced staff use their knowledge in helping people.

As you can see, we are planning a number of ways in which to help you to learn how to be a Case Aide. It is our sincere hope that you will not only learn how to be of help to people on your job, but that just learning this new job will be an enjoyable experience as well.

Induction Training

Induction training will begin next week, after you have begun your job, and will continue for several months. In these coming months, your supervisor will be helping you with your new job, and to apply what you have learned in group-training sessions to your work with individual clients. You will also be attending additional group-training sessions. Not only will you be offered new information of use to you in your job, in these sessions, but you will be able to discuss this information, together with other Case Aides, in our search for still further ways of being of help to people.

Purpose of This Workbook

This workbook has been designed as an aid to you in your training sessions and on your job assignment. It includes a variety of classroom materials that you will be using. Your trainer will help you to use this book as he discusses various subjects with you. For each session, there is a place for you to jot down notes for your later reference and use on your job. Feel free to write in your workbook. It is your own personal copy and our way of introducing you to your new job. Many of these exercises are designed to serve as a bases for discussion and therefore do not necessarily contain all the information you will want. For example, the exercise on page 16 asks you to make some judgments which will not be as easily made in your work with clients. However, we hope this will stimulate you to ask additional questions about your new job assignment.

AN EXERCISE ON WHAT CASE AIDES DO

One Case Aide in discussing her work with a multi-problem family said:

> "The roach situation is very bad. They are going all across the wall and nobody is stopping to knock them down, you know. It's hard for me to sit there and I got into this - 'well why don't we remove these roaches because the children are around and it might be bad for the children.' I wrote on a piece of paper the name of an insecticide and about how much it would cost and said I would like to see him spray. He did. He followed my instructions. The next time I was out he had two cans of insecticide. Because I had been thinking in terms of these roaches I stopped on my way to their home at an Army surplus store and picked up a spray gun; the man let me have it for 25¢. I find that there are more fluid ounces in a can of insecticide rather than the aerosol can - it's larger but it's for the pressure in it. So I didn't need the spray gun but I do have other clients with roaches, so I will give my spray gun to them. He did spray the roaches; on this he followed my instructions to the letter."*

Answer the following questions:

1. What do you think about the way this Case Aide handled the problem of roaches with this family?

   _____

   _____

   _____

2. Do you think it is important for the Case Aide to be concerned about the amount of fluid ounces in a can of insecticide rather than an aerosol can?

   _____Yes _____No

   Explain: _____

   _____

3. List three or four more ways in which a Case Aide might help a family:

   _____

   _____

   _____

15656

WHAT IS PUBLIC WELFARE?*

A forty-year-old woman, whose sole income came from her AFDC grant, described public welfare in the following way:

> "The main thing, too, is that from the very word go the income is based on the barest necessities. There is no such thing as an extra income, so say something - an accident or something else - happens that you've got to have extra transportation money; there's no such thing as there being a fund that can be an emergency fund that can be sent to you, you know, on the spur of the moment.
>
> "Like, for instance, if you get a check on the first of the month, okay, that's our rent, utilities, phone, and so forth, and the kids have to have shoes. Then the next one is for the fifteenth - we get a little groceries on the first, enough that'll hold us until the fifteenth - then we do our heavy shopping. But you still got another bill or the kids need something or something is going on somewhere. You better believe there's always something, especially when it gets cold weather. And we can't live without necessities for ourselves - our personal necessities and our house necessities. Like I told my worker, my children have to take baths, my children have to have clean clothes to put on -- and I can't clean up the house with the food I eat. All you can buy is food, and you can't buy much of a meal anyway because of the prices you got to pay.
>
> "And another thing is that the caseworkers is falling under such a caseload that they don't have the time to give to the personal problems of people that they're dealing with. They don't have time to listen a lot of times. This is where it is - a person will have a problem or a person will have a particular need to know something, and his social worker is sometimes his only contact with professional, educated-type people that could give him advice, and he's busy, he's had a lot of cases like this, he's tired, he's cranky, he doesn't want to be bothered. This causes quite a hassle, quite a feeling of insecurity."*

Answer the following questions:

1. How did you feel after reading this statement by a client?

   ___Mad ___Sad ___Indifferent ___Other Feelings

   Why did you feel this way?_____

658

People who work in public welfare frequently use abbreviations in referring to various aid programs. The following is a list of abbreviations you will want to learn.

OAS = Old Age Security.

AFDC = Aid to Families With Dependent Children.

AFDC-U = Aid to Families With Dependent Children - Unemployed.

AB = Aid to the Blind.

APSB = Aid to the Potentially Self-Supporting Blind.

ATD = Aid to the Needy Disabled.

GR = General Relief.

Some Suggested Readings on Public Assistance Programs, prepared by the State of California, Human Relations Agency, Department of Social Welfare (available free in limited quantities from the publication section, State Department of Social Welfare, 744 P Street, Sacramento):

Aid to Unemployed Families

Aid to Families With Dependent Children

Aid to Needy Disabled Program

Complaints and Fair Hearings in Public Assistance Programs

Food Stamp Program

Important Notice on Civil Rights

Keep Us Posted

Old Age Security

Social Welfare Programs for the Blind

State Services for the Blind in California

Public Assistance and Welfare Services in California

PUBLIC WELFARE PROGRAMS, SERVICES AND RESOURCES

Some definitions of words that you will need to know:

1. PUBLIC WELFARE - An agency set up by law to provide financial assistance and social services for selected groups of persons.

2. PUBLIC ASSISTANCE - Financial aide provided to persons determined by defined standards, to be in need.

3. SOCIAL WELFARE - Society's concern for the well-being of people in their personal daily lives.

4. SOCIAL WORK - A body of knowledge, skill and ethics, professionally employed in the administration of social services and in development of the programs of social welfare.

5. SOCIAL WORKER - A person with graduate education in social work or an undergraduate major in social welfare and who uses special skills and knowledge to help people with personal and family problems and interpersonal relationships.

6. SOCIAL SERVICES - The ways in which men translate into action their sense of obligation to contribute to the well-being of others through development of planned ways of contributing to that well-being.

7. SOCIAL SERVICES WORKER - An agency employee responsible for the providing of agency social services to clients and for the coordination of the agency's service activities in order to maximize their potential benefit to the client.

8. ELIGIBILITY WORKER - An agency employee responsible for determining the client's eligibility for financial assistance and for continued eligibility for assistance programs.

9. VOLUNTEER - A person who although not an agency employee volunteers his time to the agency to perform needed tasks.

How much do you remember? See if you can complete the following paragraph by filling in the appropriate word:

_____ is a community agency concerned with the well-being of people. It provides _____ to needy persons in order that they can live at a level compatible with health and decency. In addition, it is concerned with the many problems which clients may face and attempts to help them with these problems by providing a wide range of _____. Among the agency staff with whom a client

15660

will have contact are the _____ who are primarily concerned with helping them with personal and social problems; the _____ who determines the amount of the grant to which they are entitled; and the _____ who, although not an agency employee, may be asked to assist a client with a specific problem. Public Welfare is only one of a number of community agencies that are concerned with the _____ of people. Many of these agencies employ _____ who, because of their special knowledge and skill, are able to help people to overcome problems which prevent them from achieving their potential for productive, independent living.

You should have one word left over which you did not use in this paragraph.

- -

Some notes from class discussion:

1. Why are social services provided by the agency?

_____

_____

_____

_____

_____

_____

_____

_____

_____

_____

-15661

2. What are the public welfare programs, services and resources we have discussed?

_____

_____

_____

_____

A SECOND OBSERVATIONAL EXPERIENCE (Answer the following questions after you have observed the interview.)

1. What did the client want or need to know?_____

_____

_____

_____

2. How was the subject of the resource introduced in the interview?

_____

_____

_____

3. How was the resource explained?_____

_____

_____

4. Did the client appear to understand the resource? If not, why not?

_____

_____

_____

5. Was anything done to help the client in using the resource?

_____

_____

THE QUALITIES OF A HELPING PERSON

Being a helping person requires more than just experience. It requires practice as well. As a Case Aide, what might your immediate response be to a client who made the following comments to you?

1. Client: "Mrs. Smith, my social service worker, said that you could help me to find another place to live. I've been evicted from here."

   Your immediate response might be: _____

   _____

2. Client: "Moving isn't going to solve anything for me. That is really the least of my problems and I can't really spend my time looking for another place now, even if I have to move by the end of the month."

   Your immediate response might be: _____

   _____

   _____

3. Client: "I suppose I should have paid my rent as soon as I got my welfare check and I sure wish now that I had. However, I felt that I had to get the television fixed - its the only way that I can keep the children occupied while I try to fix dinner."

   Your immediate response might be: _____

   _____

   _____

4. Client: "I suppose you are in a hurry for us to start looking for a place to live. I know you are a busy person and can't waste your time on me."

Your immediate response might be: _____

_____

_____

5. Client: "Even though I know there are places to rent in the south end of town, I absolutely refuse to live there."

Your immediate response might be: _____

_____

_____

Some notes from class discussion:

1. What are the characteristics of a helping person?

_____

_____

_____

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VI. COOLING SYSTEM

MILESTONE: I. RADIATOR, ENGINE, HOSES, AND THERMOSTAT

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Remove and Replace Radiator, Hoses, Thermostat, Flush Radiator and Engine

CONDITIONS:

This assignment is to be performed on a complete automobile.

BEHAVIOR: After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropriate chapter
4. Select proper tools, materials, etc.
5. Raise hood
6. Place protective covers on fenders of automobile
7. Drain cooling system
8. Remove radiator and heater hoses following all steps as outlined in the manual
9. Make all checks and tests as outlined in the manual
10. Replace radiator and heater hoses following all steps as outlined in the manual
11. Remove top radiator hose from radiator
12. Remove bottom radiator hose from water pump
13. Reverse flush radiator following all steps as outlined in the manual

PERFORMANCE CRITERIA:

2. What do I need to remember in understanding others?

Before you finish this session, turn back to the responses you suggested on the previous page. Do they reflect the qualities of a helping person that you have identified in class discussion?

15665

HOW DOES A CASE AIDE HELP?

Answer each of the following questions by making an X under the word "yes" if you agree with the statement, and under the word "no" if you do not agree with the statement.

YES	NO		
		1.	I should tell a client that I have been on public assistance in order for him to know that I can understand how he feels.
		2.	I have often suggested a way in which I have solved a similar problem, thinking that perhaps the client might be able to use a different way of handling it.
		3.	I usually avoid telling clients about particular stores in which I shop, because it is important that they learn to shop wisely for themselves.
		4.	Sometimes a client can learn more when I show them how to use a resource, rather than when I just tell them about it.
		5.	I know that there are some clients that I will not be able to help as much as I would like.
		6.	If at all possible, I try to find another resource for the client to use, when the agency cannot meet a specific financial need which he has.
		7.	It is important to help clients understand the policies and procedures of our agency.
		8.	I try to avoid telling people that I don't know the answer to their question.
		9.	Although it is difficult to say "no" to requests, it is sometimes necessary to do so.
		10.	I prefer to maintain a business-like relationship with clients who try to tell me about their personal troubles.
		11.	It is important to listen to the client's concerns, even if they differ from the reason for my visit.
		12.	I believe it is important to explain to the client how I, his social service worker, and eligibility worker, are each available to help him, but in different ways and with different things.

Some notes from class discussion:

1. Some ways of establishing rapport.

2. How to prepare for an interview.

3. Some hints on interviewing.

4. Ending the interview.

5. What should I do following the interview?

A THIRD OBSERVATIONAL EXPERIENCE (Answer the following questions after you have observed the interview)

1. Did the interview achieve its purpose? If not, why not?

_____

_____

_____

2. What did you learn about the client that you did not previously know?

_____

_____

_____

_____

3. If a return visit is planned, what will be its purpose?

_____

_____

_____

_____

_____

4. What information did you obtain that would help the Social Service Worker and Eligibility Worker in their work with this client?

_____

_____

_____

_____

_____

5. What questions do you have as a result of this interview?

_____

_____

EVALUATION OF TRAINING:

We are interested in knowing how you feel about the orientation course you are now completing. We hope to improve it as we go along. Therefore, would you please answer each of the following questions and help us by being frank in your opinions.

DO NOT PUT YOUR NAME ON THIS FORM.

---

1. Please complete each of the following sentences in relation to how you feel about this orientation course.

   Of all of the areas we have discussed, I found most helpful ...

   The area I found least helpful was ...

   I would recommend changing ...

   I hope you will not change ...

   I believe the trainer should ...

   I hope that the trainer will not ...

   My observational experiences have been ...

2. Considering your past experiences and knowledge, as well as what you have learned during this week of training, list four ways in which you believe you are presently most ready to begin helping clients.

   (1) _____

   _____

   (2) _____

   _____

   (3) _____

   _____

   (4) _____

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VI. COOLING SYSTEMS

MILESTONE: I. RADIATOR, ENGINE, HOSES, AND THERMOSTAT

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Remove and Replace Radiator, Hoses Thermostat, Flush Radiator and Engine

CONDITIONS:

BEHAVIOR:

14. Remove thermostat and thermostat housing
15. Remove thermostat from housing and perform all checks and tests as outlined in the manual
16. Reverse flush block following all steps as outlined in the manual
17. Replace thermostat and housing
18. Connect radiator hoses
19. Fill cooling system with coolant
20. Perform all tests and checks as outlined in the manual
21. If all tests and checks are satisfactory, remove protective covers from fenders and store in proper place
22. Return all tools and materials to proper location
23. Close hood making sure it is securely latched
24. Return automobile to proper parking area
25. Remove protective covers from front seat of automobile and store in proper place
26. Clean work area

PERFORMANCE CRITERIA:

To be able to satisfactorily flush radiator and engine, and to satisfactorily remove and replace radiator, hoses, and thermostat in 4 hours.

Learning time; 6 hours

1563

ASSESSMENT OF WHAT YOU HAVE LEARNED

We are also interested in finding out what you have learned in your training sessions. Would you help us to do this by answering the following questions. Again, you need not put your name on this form.

- - - -

		Agree			Disagree
(5)	It is the county department's major responsibility to give as little money as it can to clients.	1	2	3	4
(6)	The use of food stamps or surplus food is one important resource for clients because it is a way of expanding their food budget.	1	2	3	4
(7)	Agency clients are not eligible for medical care, except in cases of emergency.	1	2	3	4
(8)	Social services are provided by the agency in order to help clients overcome personal and family problems.	1	2	3	4
(9)	Public welfare is not concerned about day care for children.	1	2	3	4
(10)	In planning your interview it is important to know what the purpose of your interview is, before you see the client.	1	2	3	4
(11)	It is not always necessary or important for the Case Aide to work closely with other agency staff who are seeing the client.	1	2	3	4
(12)	Confidentiality means that the Case Aide never shares information about her client with other agency staff.	1	2	3	4
(13)	There will frequently be times when a Case Aide must decide what is best for a client and tell him exactly what he is to do.	1	2	3	4
(14)	Not all clients should be given welfare, especially when they do not spend their money wisely.	1	2	3	4
(15)	As a Case Aide, I am responsible for helping a client report any income to his Eligibility Worker.	1	2	3	4
(16)	I do not believe that a Case Aide should ever let a client do something that will hurt him, even if he is adamant about wanting to do it.	1	2	3	4

15676

D. Client: "I have been doing ironing for my neighbor and earning about $10.00 a month. Please don't tell Mr. Jones, my Eligibility Worker, because he would stop my check.

Response:

1. Did you know that Mr. Jones can allow you to earn some money before subtracting some of it from your check?

2. Perhaps you should tell Mr. Jones. He will know how to figure this so that you will have every advantage possible.

3. I will have to report this to Mr. Jones.

4. I won't tell anyone about this.

When you have answered all of the questions, remove this evaluation from your workbook and give it to your trainer. Thank you for your help with this evaluation.

If you would like to make any additional comments about the training sessions, and what you have learned, please do so on the remainder of this page.

USING THE TELEPHONE EFFECTIVELY:

Answer the following questions about using a telephone:

1. Do you ever pick up the receiver of a ringing telephone, and say "Hello?" Yes: _____ No: _____

2. Ask a caller to wait while you get information; then stay away from the telephone so long that he hangs up? Yes: _____ No: _____

3. Have you ever received a call for someone who isn't in the office and then forgot to tell him about it? Yes: _____ No: _____

4. Have you ever transferred a telephone call to someone else, when you were not sure they could help? Yes: _____ No: _____

5. Do you ever chat with a friend who calls you during working hours as though you were at home? Yes: _____ No: _____

Here are two examples of how two Case Aides handled similar telephone calls. What one do you think does the better job.

Mrs. Smith handled it this way:

"Mr. Jones' desk; Mrs. Smith speaking."
"Mrs. Smith, this is Mr. Johnson."
"How are you, Mr. Johnson? And the wife and children?"
"All in good health - now what I was calling about was my appointment with Mr. Jones' tomorrow at 2:00 p.m."
"Oh yes, Mr. Johnson, i can see from Mr. Jones' schedule that he does have an appointment with you tomorrow. I hope the weather is better tomorrow when you come in."
"Well, what I was calling about, was that I'd like to postpone my appointment until about 3:00 p.m. I have a job appointment earlier in the afternoon and I doubt if I can get to your office any earlier."
"Oh what a shame, Mr. Johnson. I'm sure Mr. Jones will be disappointed, I can have Mr. Jones telephone you later this afternoon to let you know if he can see you at 3:00. Will that be satisfactory, Mr. Johnson."
"Yes, thank you. Goodbye."

Mrs. Brown handled it in this way:

"Mr. Jones' desk, Mrs. Brown speaking."
"This is Mr. Johnson, Mrs. Brown."
"May I help you, Mr. Johnson."
"I'd like to postpone my appointment with Mr. Jones tomorrow from 2:00 to 3:00 p.m. I have a job appointment earlier in the afternoon and I doubt if I can get to your office earlier."
"I'm not sure whether Mr. Jones has that time open on his schedule, but I can have him telephone you later this afternoon and tell you if he can see you at 3:00 p.m. Will that be satisfactory, Mr. Johnson."
"Yes, thank you. Goodbye."

15682

Which person do you think handled this situation better?

Mrs. Smith: _____ Mrs. Brown: _____

A FRAMEWORK FOR HELPING

Following is a brief description of a case situation involving a visit of a Case Aide with a client. What would you do in a situation like this?

The Alice Sanchez Case

A Social Service Worker asked me to visit with Mrs. Sanchez. At the time of her last visit to the home, the worker had found Mrs. Sanchez to be very tired, her home was a mess and, yet, she claimed that "everything was fine."

Mrs. Sanchez and her three children, Bob, John and Mary, live in an old house on Vista Road. It is beyond the city limits and therefore has no sidewalk in front of the home. There is no lawn for the children to play on and the yard is used mostly for discarded items no longer of use to the family.

Mrs. Sanchez answered the door and seemed surprised to see me, although I had written her a letter about my planned visit. She wore a houserobe and her hair was still in curlers - she appeared to be sleepy and perhaps had not been up very long.

I told Mrs. Sanchez that her Social Service Worker, Mrs. Jones, had asked me to visit her because she seemed so very tired when she last visited. Mrs. Jones had thought that perhaps I could be of help to her. She invited me into her home and we sat in her living room. Mrs. Sanchez said that everything was really alright, although she had not been able to manage her house very well because the children had all been sick with colds. There didn't seem anything else for us to talk about, so I asked her about Mary, who I could see sleeping in the next room. She told me that Mary did not seem to be getting over her cold. She seems so hot all of the time and has eaten only a very little food in the past two days. Sometimes when she is awake she doesn't seem to know me, Mrs. Sanchez said, beginning to cry as she spoke about Mary's illness.

I said to Mrs. Sanchez...

What would you do next with Mrs. Sanchez? List the various things you might do on this visit, based upon what you know so far.

_____

_____

_____

_____

_____

_____

_____

What else, if anything, would you want to know from Mrs. Sanchez in order to help?

_____

_____

_____

_____

_____

_____

_____

2. How can I use a "self-help" concept in my work with clients?

_____

_____

_____

_____

_____

_____

HELPING AS A CASE AIDE

Four different examples of helping:

1. It was very early in the morning when Mary Smith, a Case Aide, arrived at the Allen home. Mrs. Allen had telephoned Mrs. Smith the previous evening, saying that she was without food for her children and was obviously upset, being afraid of sending the children to school the following morning without breakfast. After their telephone conversation, where Mrs. Smith had determined that there was just enough food left for the family dinner, she telephoned several churches in the neighborhood. One minister offered enough food from church supplies to tide Mrs. Allen over for a few days until her welfare check would arrive. Mrs. Smith then arranged to pick up this food early the next morning from the church so that she could bring it to the Allen home in time for the children to eat before going to school.

2. Mrs. Johnson, a Case Aide, has been visiting with Mrs. Dunbar for several weeks in an effort to help her with household management problems. Even before ringing the doorbell this morning, Mrs. Johnson could notice a major change in the home. Someone had put brightly colored, cheerful curtains on the windows which had previously been barren. As Mrs. Dunbar answered the door, Mrs. Johnson enthusiastically commented upon change in appearance of the room with curtains. Mrs. Dunbar was obviously proud that her effort had been noticed, and the two spent the first part of their conversation talking about how much better the room now looks with curtains in the window, and the time it must have taken Mrs. Dunbar to make them.

3. One Case Aide described her work with a father whose neglect of his daughter's personal hygiene and dress had caused her to be ostracized by the other children at school.

> "I told him I expected him to keep her clothing clean, including the underclothing. I told him to make good soapy water and let her put them in and soak them while she is at school. Then I told the little girl she is to wash these panties and slip and hang them where they will get dry by the next morning. This way every day you will have clean underclothing to put on until we can get some more. The father was surprised because she opened up completely to me and answered all my questions. So I went into the bathroom and ran a tub of water, dumped soap flakes into the water, and said you get undressed now and get in the tub while I am talking with your father. I want you to take a bath. I came out and closed the door... you know I'm a stranger and I don't want her to get shy. I talked to the father about overseeing the fact that she did take a bath two or three times a week this same way with soap. He said okay. I shampooed her hair while she was in the tub and showed her how to wash herself. I pressed her hair. I had on a scarf and I tied it around her head so she wouldn't have to worry about combing it the next morning." *

4. Mrs. Benetez had been on public assistance for several years and Mrs. Lucas, her Case Aide, was very surprised to learn that she had not heard of or was seemingly unaware of the Food Stamp Program and its possible benefits to her. No doubt the fact that she spoke Spanish and could neither read or write, has kept Mrs. Benetez from learning about such resources and using them to expand her welfare grant. Because she is usually very shy and hesitant to use resources which are unknown to her, Mrs. Lucas explained the advantages of Food

88015687.5

Stamps and later took Mrs. Benetez to the food stamp center, helping her apply for and purchase some stamps. Afterwards they went shopping together so that Mrs. Lucas could show her how these stamps are used in place of money, and what items could be purchased with the stamps.

Briefly summarize the ways in which Case Aides offer help to clients in each of these four examples:

1. _____

2. _____

3. _____

4. _____

UNDERSTANDING AND TALKING WITH CLIENTS

Read the following description of how one husband and wife communicate.

"He can be quiet for long stretches of time, obviously and moodily quiet. His wife finds his silences hard to bear. She doesn't know what they will 'lead to.' Every day she asks her husband whether there is anything 'special' he wants to eat - even though they both know there isn't much they can afford but the daily mainstays -- bread, coffee, doughnuts, crackers, some thin stew, potatoes, homemade jam, biscuits. Mrs. McCaslin defers to her husband, though; one way is to pay him the courtesy of asking what he wants. I have often heard them go back and forth about food, and as if for all the world they were far better off, with more choices before them:

'Anything special you want for supper?'

'No. Anything suits me fine. I'm not too hungry.'

'Well, if that's it then I'd better make you hungry with something special.'

'What can do that?'

'I thought I'd fry up the potatoes real good tonight and cut in some onions. It's better than boiling, and I've got some good pork to throw in. You wait and see.'

'I will. It sounds good.'

He hurts and she aches for him. His back has its 'bad spells,' and she claims her own back can 'feel the pain that goes through his.' They don't touch each other very much in a stranger's presence, or even, I gather, before their children, but they give each other long looks of recognition, sympathy, affection, and sometimes anger or worse. They understand each other in that silent, real, lasting way that defies the gross labels that I and my kind call upon. It is hard to convey in words -- theirs or mine -- the subtle, delicate, largely unspoken, and continued sense of each other (that is the best I can do) that they have. In a gesture, a glance, a frown, a smile they talk and agree and disagree.

'I can tell what the day will be like for Hugh when he first gets up. It's all in how he gets out of bed, slow or with a jump to it. You might say we all have our good days and bad ones, but Hugh has a lot of time to give over to his moods, and around here I guess we're emotional, you might say.'"*

COMMUNITY RESOURCES

What is a community resource?

"Those resources, either formal or informal, which meet the financial, health, employment, political, cultural, social or spiritual needs of the members of the community."

Some examples to look at:

1. The Jones family have a son stationed in Viet Nam, from whom they have not heard for over three months. Letters to him have not been answered and Mrs. Jones has become quite upset, afraid that her son may be missing in action. Check where you might refer them for help.

   _____ To a Social Service Worker.

   _____ To their minister.

   _____ To the local Red Cross office.

   _____ Not enough information upon which to decide.

   Explain why you chose the particular resource: _____

   _____

2. Mrs. Smith has become increasingly concerned about her son, Michael, who does not eat well and has had one cold after another during the past several months. Check where you might refer Mrs. Smith for help with Michael.

   _____ To a Social Service Worker.

   _____ To the county hospital.

   _____ To the county health department office.

   _____ To her Eligibility Worker.

   _____ Not enough information upon which to decide.

   Explain why you have chosen this particular resource: _____

   _____

15692

3. Mrs. Harris had been without electricity for two days, when her service was stopped by the utility company because she had not paid her bill. The Eligibility Worker has said that the agency cannot provide additional funds to pay this bill because Mrs. Harris had already received money for her utilities in her welfare check. Check where you might refer Mrs. Harris.

_____ To her Social Service Worker.

_____ To the minister at her church.

_____ To a loan company.

_____ To the utility company.

_____ Somewhere else. Specify: _____

_____ Not enough information upon which to decide.

Explain why you have chosen this particular resource: _____

_____

4. Mrs. Landau is desperate about finding winter coats for her two older children who are presently without sufficiently warm coats to attend school on cold days. Check where you might refer her.

_____ To her Eligibility Worker.

_____ To the Goodwill or Salvation Army store.

_____ To her local church.

_____ To her relatives or neighbors.

_____ Not enough information upon which to decide.

Explain why you have chosen this particular resource: _____

_____

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VI. COOLING SYSTEM

MILESTONE: II. WATER PUMP

PERFORMANCE OBJECTIVE NO.: 2 TITLE: Remove and Replace Water Pump

CONDITIONS:

This assignment is to performed on a complete automobile

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Raise hood
6. Place protective covers on fenders
7. Drain engine block and radiator
8. Remove parts and accessories following all steps as outlined in the manual
9. Remove water pump following all steps as outlined in the manual
10. Perform all tests and checks as outlined in the manual
11. Install water pump following all steps as outlined in the manual

PERFORMANCE CRITERIA:

HELPING A CLIENT TO USE A RESOURCE

Read the following brief description of a case situation involving a Case Aide.

The Amy Harris Case:

Amy Harris and her two children, Mary (age 6) and Michael (age 3), have been receiving assistance for the past two years under the Aid to Families of Dependent Children Program. During these two years, she has continued to live in a small rented house on the edge of town. Although never in very good condition, in the past year this home has been plagued with a number of problems, and the landlord has refused to make needed repairs. The steps at the front door are rotting away, the plumbing in the bathroom is frequently out of order, and the cost of heating the home has markedly increased as a result of a broken window (which is covered only with cardboard) and the open spaces around the doors. With the more recent influx of rats, Mrs. Harris has reluctantly decided that she can no longer tolerate these living arrangements and must find more adequate housing for her family.

When Mrs. Harris asked the agency to help her in locating more suitable housing, this case was assigned to a Case Aide. The Case Aide, being familiar with housing resources, is aware that there is very limited low-cost housing available for Mrs. Harris to consider. A government housing project, not far from where she presently lives, would offer the most benefit for Mrs. Harris insofar as space and the conditions of the building are concerned. With this knowledge in mind, the Case Aide has scheduled an appointment to talk with Mrs. Harris about her housing needs and to make a referral to the housing authority office that runs this project.

Based upon the information available to you in this case situation, list the steps you might take in helping Mrs. Harris to the housing authority office.

POVERTY: ITS CAUSES AND EFFECT

Many people talk about poverty, but too often, each of us views poverty in a little different way. Therefore, let's see if you can decide what poverty means to different people by looking at several descriptions.

One mother described her poverty in this way:

> "They say we're lazy and we don't pay much attention to the law, and sure enough I have two boys to prove it and one to disprove it, so it's two to one against us in this family. But I'd like to tell people why I think my two boys went bad.
>
> I preached and hollered at all three the same. Those older boys were good boys just like the little one, and I remember when they wanted to study and be somebody, just like him. But they never had a chance. They were born too soon...
>
> They went to school until it didn't make any sense to stay there, because we had no money and they thought they should try to get jobs. So they left school and tried. They tried and tried and there wasn't anything for them.
>
> I wonder, do people who never have to worry about work know what happens to you when you keep on knocking your head on a stone wall and there's still no work? I'll tell you what, your head bleeds, and you get tired; you get so tired that you give up. Then you have all those hours and whatever you can figure out to do with them...
>
> ...Now, it's all right if you're an older woman like me and you have children; you keep busy with them. But if you're a man, you don't have kids to occupy you. So what can you do? I'll tell you what happens, you just fold up and die....
>
> I watched my boys go bad like milk you know is standing too long; there's no use for it, so it gets sour...*

Another mother writes about the amount of money allowed her family for rent:

> "How can a welfare recipient have safe, healthful housing when the rent allowance is so low that it covers only about one-half of what he is now paying for rent - unless he lives in a housing project, and there, everytime he gets an increase in his budget the rent is raised. He cannot afford to move to a better residence because then he would use the food allowance - he can't afford the amount of rent he is now paying for the high-rent, run-down house or apartment he's in now,

80689

designed for three or four people, which he has to stick three or four children into each bedroom or bed, and if he's lucky, he ends up in the living room - if he is not lucky he sleeps in the bath tub or maybe the family sleeps in shifts... How! How can you rent a three or four bedroom house on a NO-bedroom allowance - $55 per month (monthly rent allowance for most welfare recipients - some even less). This large amount will get you an unfurnished single on the lower east side - NO CHILDREN - but CATS allowed; because the RATS come pretty BIG and the CATS aren't allergic to RAID and BLACK FLAG used to try to kill the roaches. How can a sardine-can be safe and healthful????? For a sardine - you - but he's dead and nothing matters then anyway...*

A writer has said:

"Poverty is many different things - a sick old man on welfare, a drunk beating his wife, cockroaches in the kitchen and the stench of urine in the corridor, a dirt farmer fighting an unwilling soil, an unwanted Negro boy sitting on a stoop, a miner with nothing to do. All of these conditions - and more - are suggested in the statistics on poverty. But numbers are abstractions and people are real. It takes more than numbers to reach the state of knowledge that **e. e. cummings** described so well:

Now the ears of my ears awake and
Now the eyes of my eyes are opened.**

Can you think of five ways in which you might help people like this?

3. What can I do as a case aide to lessen the effects of poverty upon clients?

15701

SOME MYTHS ABOUT PUBLIC WELFARE AND ITS CLIENTS

Have you ever taken time to read the "letters to the editor" column in your local newspaper? The following are several such letters for you to consider.

1. "Sir: The other day I read a letter from a party in San Diego who stated there is no corruption in welfare. I would like to have him explain this: In the town where I live, there is a woman we have complained about several times, and we even circulated a petition signed by at least 15 people. She is on relief and has six dogs that bother the people all night. She just bought two St. Bernards at $150 apiece, on the tax money we pay. Complaints to the sheriff's office and to the animal control have had no effect at all. Welfare is surely misused here. Let him explain that."*

   Do you think that this client should be allowed to keep her dogs?

   YES _____ NO _____

   Explain your answer: _____

   _____

   _____

2. Editor: "I believe the only way that hunger in the United States can be controlled is by handing out food to the poor.

   "People today don't know how to use the money that they get to feed and house themselves with. I know one lady that has three cars and she doesn't work, so I don't know why she needs them. She just bought a $35 dog when she already has two dogs." **

   Do you agree that handing out food would be a better way to combat hunger?

   YES _____ NO _____

   Explain your answer: _____

   _____

   _____

* Reprinted from the Sacramento Bee, February 19, 1970.
** Reprinted from the Sacramento Union, January 28, 1970.

CORBI 15702

3. "Sir: The three point system to curb the population explosion given in one of your letters on January 15 should be put to a vote by the people of California. The third point - compulsory sterilization of mothers on welfare after the second child - should be certainly put in force.

" The strongest point against this action is taking away a freedom of people on welfare, when in actuality they are taking away our freedom to spend our hard-earned wages the way we want, instead of supporting them to a way of life equal to ours, without having to work for it, leaving them their freedom to propagate at will.

"The strongest point for this action would be less people on welfare, eventually, as the children grew older and the mother could work. It would discourage the absentee husband, now the practice of the majority of large family welfare recipients."*

Do you agree or disagree with this person's point of view?

Agree _____ Disagree _____

Explain your answer: _____

_____

_____

4. "Sir: My heart just bleeds for the poor family who got their welfare check in November in time for a nice turkey for Thanksgiving Day, but failed to receive their December check in time for a big Christmas.

"No wonder so many people are on welfare if they spend their check for one big blowout and moan their hard luck when the next check doesn't arrive in time for another big show.

"I don't recall having a turkey for Thanksgiving and Christmas in my childhood, and I don't recall that it was such a sad day. We were thankful to the Good Lord for what we did have. And what we had was earned the hard way. Perhaps that is why we were grateful for what we did have." **

Do you think that many welfare families spend their money for one big "blow-out"?

YES _____ NO _____

Explain your answer: _____

_____

_____

MEAL PLANNING AND BUYING

An exercise in shopping:

The following are a number of items found on one client's shopping list and are similar to many items which people on a limited income would frequently be buying. In order to get the most for your money, shopping in various stores can sometimes result in marked savings so that some of the client's income is used to meet other needs. Using this client's list, would you go to three stores and write down the price of each item. Enter the size of the item at the first store so that a similar size is priced at each store, although you may select a different brand, if the item is cheaper in any one of the stores.

Select the following kinds of food stores to collect your prices:

1. A small, neighborhood grocery store, preferably in an area where clients live.

2. A large chain grocery store.

3. A food discount store, if one is available in your area.

Ask your trainer for help in selecting the specific stores you will visit, if you are not sure which ones to choose.

LOOK FOR THE BEST BUYS IN FOOD

Some things to remember from class:

1. One way of meal planning and buying.

2. Some other ideas which the case aides have found useful.

HOUSEHOLD MANAGEMENT

Taking care of a home - cleaning, shopping, planning and preparing meals, washing and ironing - can be a most difficult job for any person. Most people have learned some ways of making this job a little easier, although they may not often stop to think about them. The following are several examples of ways in which individual persons have found to make their work easier.

One woman reported that:

> "I have found that if I plan my washing several times a week, rather than once a week, I don't seem to get so far behind in my ironing, and the children are more likely to have something clean to wear when they need it."

A second woman reported that:

> "I have found that if I add a little apple to the children's oatmeal when I cook it, they are much more likely to finish their breakfast."

A third woman said:

> "One way to avoid scrubbing bathtub rings, she learned, is to put a small amount of liquid detergent in the children's bath water - and the children like the bubbles."

These ideas may or may not be of use to other persons but each represents one person's way of making her job just a little easier.

Give some thought to the things that you have learned to do. See if you can list five ideas below, which might also be of help to a client.

FAMILY BUDGETING

A definition of budgeting: An itemized plan of how a family will spend its income.

Family budgeting is a difficult task for most persons, but the more limited a person's income is, the more complicated becomes the task. Each of us budgets our expenses, even when we do not take the time to do so carefully. The decision whether we should buy a magazine to read, some special treat for the children, or an item of clothing, must be weighed in terms of its possible later consequence - what might we then have to do without.

Some examples of poor buying:

1. "I saw a TV ad for a $29 sewing machine, so I wrote to the company and they sent down a salesman who demonstrated it for me. It shook the whole house, but I wanted to buy it anyway. But he kept saying it would disturb all the neighbors by being so noisy, and went out into the hall and brought in another model costing $185....

   "I actually had to pay $220. He promised if I paid within a certain amount of time I would get $35 back. But since my husband was out of work, we couldn't pay within the time period, so I didn't get the refund... I was taken in by the high-pressure sales talk."*

2. "In March ..., a peddler knocked at my door and insisted so much that I said I'd take a lamp for $29. I gave him a $3 deposit. When he came back with the account book the next week, the price had gone up to $42. I said I wouldn't pay it. So he took away the lamp, but he never gave me back the $3."

3. "We've spent more money repairing the TV than it cost. The store sent a different one than we asked for and it didn't look new. We complained to the store and they offered a trade for $25 on another one."*

If you were asked to help any one of these three families in budgeting, so that they could better know how much of their money they could spend on items, what would you suggest they do?

What other approaches have participants used and found helpful? _____

PRINCIPLES OF CHILD CARE AND CHILD REARING

Some thing to think about:

1. Mary has only one arm. She is 18 months old. She wants to feed herself but cannot hold the dish still.

   Mrs. B. says she should have a dish that has a suction cup on it that will not move. Then she can learn to feed herself.

   Mrs. R. says that because she has only one arm, she should be fed by another person until she is older.*

   Who is right? _____

   Why? _____

   _____

   _____

2. John is six years old. He has just started school. He is doing very well at school. Each day his mother checks with the teacher. She asks if John did well. If he did, she buys him something at the store.*

   Is this a good idea? _____

   Why or why not? _____

   _____

   _____

3. Alice is three years old and a very active youngster. In order to keep her from getting dirty, Mrs. H. keeps her in her crib most of the day, until she can finish her housework and spend time with her.

   Do you think this is a good idea? _____

   Why or why not? _____

   _____

   _____

4. Michael is sixteen years old. His mother, Mrs. L., makes him come home immediately after school each day and rarely allows him to attend school activities in the evening. Mrs. L. has seen so many other boys get into trouble in the neighborhood and she is determined to avoid her son turning "out bad."

   Do you think that Mrs. L is right? _____

A Training Course on the Supervision of Case Aides.

California State Human Relations Agency, Sacramento. Dept. of Social Welfare.
MF AVAILABLE IN VT-ERIC SET.
Training Aid No.39A
PUB DATE - Aug70 40p.

DESCRIPTORS - *TEACHING GUIDES; VOCATIONAL EDUCATION; *SUPERVISORY TRAINING; *CASEWORKERS; *SUBPROFESSIONALS; *SOCIAL SERVICES; WELFARE SERVICES; SUPERVISOR ACTIVITIES; PROBLEM SOLVING; STUDENT CHARACTERISTICS; JOB TRAINING

ABSTRACT - This teaching guide was prepared by the Training Bureau of the Human Relations Agency, California State Department of Social Welfare and contains six 2-hour sessions designed to prepare line supervisors to assume responsibility for new case aides. Sessions are: (1) Introduction, (2) Role of the Case Aide in Providing Services to Clients, (3) "Style" of the Case Aide and His Ways of Learning, (4) Seeking Solutions to Problems, (5) Planning for the Case Aide's Arrival and His Ongoing Supervision, and (6) Organizing and Managing the Delivery of Services. Brief descriptions, learning objectives, and a content outline accompanied by references, comments, and suggestions are provided for each session. An introductory section describes the purpose, content, organization, training model, and ways to use the guide. Related documents are available as VT 012 916 and VT 012 917 also in this issue. (SB)

INTRODUCTION

The introduction of case aides as employees in public welfare who will, in conjun
tion levels of staff, be performing either financial assistance or social service
have profound impact upon the ways in which these various client contacts are to
For this reason, the line supervisor is to play a key role in achieving the agenc
meaningful place for the case aide, within a larger team of agency staff persons,
work in concert with the client in achieving a common goal. Primarily because of
teaching, which is to be the cornerstone in the agency's attempt to build and imp
different classification levels of staff in the provision of social services and
clients, the line supervisor must now be asked to assume an expanded teaching res

This training aid is the second in a series of training aids, developed in respons
new personnel classification, the case aide. It is intended for use by county pu
their training of line supervisors who are to be assigned responsibility for the
of these new staff members. As such, it will need to be viewed in the context of
related to the previous aids which have been developed and focus specifically on
training of case aides themselves.

THE PURPOSE OF THE TRAINING AID

The purpose of this training aid is to provide, in outline form, the content nece
line supervisors who are to be assigned responsibility for the supervision of cas
for teaching this content; and to offer references where additional information
county department will want to add additional content relating to the planned use
new staff members within its own program of services and financial assistance to
the specific responsibilities which are to be assigned to and carried by various
otherwise preparing these new case aides to assume their role as an agency emplo

THE TRAINING MODEL USED

The experiences of county welfare departments in planning and preparing for the
providing services to clients, (or in performing financial assistance functions)
need to prepare more than just the new case aide to assume his job assignment.
and understand the different ways in which these new staff members will work wit
consideration must be given to the broader impact which the case aide's presence
which other classification levels of staff will work with clients as well. Simi
Worker, the Eligibility Worker, and any other classification levels of staff who
the case aide, will need to participate in planning training which will provide
of the role and functions which the case aide will perform with clients, and the
their own responsibilities with the client.

15730

case aides as employees in public welfare who will, in conjunction with other classifica-
f, be performing either financial assistance or social service functions with clients, will
t upon the ways in which these various client contacts are to be organized and managed.
e line supervisor is to play a key role in achieving the agency's goal to define a
r the case aide, within a larger team of agency staff persons, who are to be assigned to
h the client in achieving a common goal. Primarily because of the importance of supervisory
to be the cornerstone in the agency's attempt to build and implement its planned use of
ation levels of staff in the provision of social services and financial assistance to
upervisor must now be asked to assume an expanded teaching responsibility.

s the second in a series of training aids, developed in response to the creation of this
ification, the case aide. It is intended for use by county public welfare departments in
ine supervisors who are to be assigned responsibility for the supervision of one or more
members. As such, it will need to be viewed in the context of its larger purpose and
ious aids which have been developed and focus specifically on the orientation and induction
des themselves.

TRAINING AID

training aid is to provide, in outline form, the content necessary for the preparation of
o are to be assigned responsibility for the supervision of case aides; to suggest methods
ontent; and to offer references where additional information can be secured. To this, the
ill want to add additional content relating to the planned use which is to be made of these
ithin its own program of services and financial assistance to clients; as well as identify
sibilities which are to be assigned to and carried by various staff members in teaching and
these new case aides to assume their role as an agency employee.

USED

county welfare departments in planning and preparing for the addition of case aides in
to clients, (or in performing financial assistance functions), has clearly demonstrated the
e than just the new case aide to assume his job assignment. The line supervisor must know
different ways in which these new staff members will work with clients; and careful
be given to the broader impact which the case aide's presence will have upon the ways in
ication levels of staff will work with clients as well. Similarly, the Social Service
lity Worker, and any other classification levels of staff who will be working directly with
need to participate in planning training which will provide them with needed understanding
ctions which the case aide will perform with clients, and the relatedness of these tasks to
ilities with the client.

The model proposed in this training aid provides for six trai
hours of training. Such sessions can be scheduled in a conti
over a period of time (for example, two-hour sessions each we
of these training sessions is to prepare line supervisors for
aides by providing them with knowledge of why case aides are c
and to assist them in anticipating needs and thus, preparing
which is more likely to meet their more unique learning needs
These training sessions should also provide the line supervis
understand the role which the new case aide is to play in pro
services to clients; and the possible impact of his presence
by other classifications of staff with whom he will be workin

THE CONTENT AND ORGANIZATION OF THE TRAINING AID

This training aid consists of two major parts, in addition to
a series of six training sessions, organized in three columns
of possible use to the trainer in his preparation for conduct

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VII. BRAKE SYSTEM

MILESTONE: I. BRAKE SHOES AND WHEEL CYLINDER

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Remove and Replace Brake Shoes and Overhaul Wheel Cylinder

CONDITIONS:

This assignment is to be performed on all wheels, front and rear, on a complete automobile. Institutional regulations prohibit road tests.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Position lift arms under automobile frame and raise automobile to a comfortable working height
6. Remove wheels, front and rear, following all steps as outlined in the manual
7. Remove brake drums following all steps as outlined in the manual
8. Remove brake shoes following all steps as outlined in the manual
9. Disassemble wheel cylinders following all steps as outlined in the manual
10. Make all checks, tests, and inspections as outlined in the manual

PERFORMANCE CRITERIA:

individual and unique uses of case aides which is planned within the department's ance and social services. Although greater emphasis has been placed upon the iding social services to clients, in outlining this material, this content can d to assignments of aides within the income maintenance system, through the use llustrations.

	Comments, Suggestions
D. The Case Aide's Ways of Working With Clients	
Probably no area has received greater attention as a result of the addition of case aides to public welfare than has their more characteristic ways of working with clients and how these will differ markedly from the methods of helping employed by the social service worker.	Encourage the participants to suggest other characteristics they know of or have read about. A brief presentation describing the more characteristic ways in which case aides will work with clients can serve as a basis for stimulating discussion.
1. Specific words used to describe the case aide's way of working with clients have included:	
a. Honesty, particularly in the way in which he frequently will raise the obvious for discussion.	
b. Frankness, particularly in the way he frequently will share his opinion with clients.	Consider the examples of helping found on pages 4, 36 and 37 of Training Aid 38B.
c. Acceptance, particularly in his ability to respond warmly to the client, accepting him as he is.	
d. Directness, particularly in the way in which he sometimes will authoritatively direct the client to take steps in overcoming some particular difficulty he faces.	
e. Informality, particularly in the way he will respond to the client on a first name basis, readily share his feelings (pleasure, anger, etc.) as well as share personal experiences as a mother, homemaker, etc., to make a point.

	a. Because his own economic deprivation life experiences have provided him wi coping skills, more likely within the of the client with whom he works;
	b. Because these "natural ways of helpin the basic enrichment of agency servic which is sought through the addition aides;
	c. Because the case aide's major contrib to agency services is to be found in ability to look back at how life real in the low-income community.
	3. Implications for supervisory teaching
	a. The need to encourage the case aide t further develop his "natural ways of helping," rather than to teach (as we to social service workers) a differen of helping.
	b. The need to be guided in the teaching case aides more by what is helpful to client, rather than preconceived idea about the way in which help "should" provided.
	c. The allowing of sufficient freedom of activity to foster the further develo of individual helping skills and inno

15757 00521

Comments, Suggestions

f. Practicalness, particularly in the way he will usually respond to the client's tangible needs and to his external life situation.

2. The importance of helping the case aide to develop further his "natural ways of helping."

a. Because his own economic deprivation and life experiences have provided him with coping skills, more likely within the grasp of the client with whom he works;

b. Because these "natural ways of helping" are the basic enrichment of agency services which is sought through the addition of case aides;

c. Because the case aide's major contribution to agency services is to be found in his ability to look back at how life really is in the low-income community.

3. Implications for supervisory teaching

a. The need to encourage the case aide to further develop his "natural ways of helping," rather than to teach (as we do to social service workers) a different way of helping.

b. The need to be guided in the teaching of case aides more by what is helpful to the client, rather than preconceived ideas about the way in which help "should" be provided.

c. The allowing of sufficient freedom of activity to foster the further development of individual helping skills and innovation.

Will often sustain attention during lengthy discussion of theoretical material	Uncomfortable wi theoretical acad discussions

Session 3 - THE "STYLE" OF THE CASE AIDE
AND HIS WAYS OF LEARNING

Comments, Suggestions

A. The Contrasting Techniques (and Materials) Used in Training and How These May Differ in Teaching the Case Aide

1. Lecture

PROFESSIONALS	CASE AIDES
Understands academic language	Not familiar with academic language
Takes relevant notes	Considerable need for written outlines, graphic and dramatic emphasis of key explicit references to examples
	Lacks note taking skills
Tends to ask pertinent questions	Often reluctant to ask questions
Can follow implicit logic of talk and digressions	Needs to understand the immediate usefulness of what is being taught
Can condense main point from extensive verbal elaboration	
Will often sustain attention during lengthy discussion of theoretical material	Uncomfortable with theoretical academic discussions

Drawing upon their own experiences, the participants should be asked to list characteristics under each of these teaching methods. The trainer can develop two lists on the blackboard for later reference and use in identifying their implications for supervisory teaching.

The importance of this comparison is that it brings out the contrast in certain operating assumptions with regard to training aides and professionals. Once the contrast is established supervisors begin to understand that aides cannot be taken for granted and trained in the usual manner.

Consider the brief forms of note taking planned for in Training Aid 38B. For example, on page 18, questions guide the case aide in deciding the kind of information he will want to remember.

References

2. Books or Manuals

PROFESSIONALS	CASE AIDES
Will do assigned readings	May have only simple r ing habits or low read level

2. Books and Manuals: a. Should be condensed and summarized. b. Stress should be placed upon the use of simplified language, illustrations and simple exercises. c. Materials used in the county department will need some modification for reference and ready use by case aides in training.	Consider the summarized way in which public welfare's program is presented in the teaching notes on pages 19, 20 and 21 of Training Aid 38A.
3. Case References: a. Case material should be developed in one- or two-page designs with short, open-ended responses. b. Short case examples are useful in illustrating key understanding of principles and concept being taught and can be used by letting case aides act out agency problems, protocol and skills. Role-playing helps the aide to understand what to do in a way which is fast and most effective.	Note the use made of case material on page 38 of Training Aid 38B. Participants might consider how they can teach nonverbal communication using this example: For an example of role playing, discuss the example on page 30 of Training Aid 38A.
4. Group discussion: a. A more effective teaching technique. b. The supervisor will want to seek a sense of belonging, confidence and involvement. c. Different group roles can be rotated (e.g., leader, note-taker, observer, et al). d. Information can be discussed thoroughly and learned in depth.

	Comments, Suggestions
e. Provides case aides with the opportunity to further develop verbal skills.	
C. <u>Some Principles of Supervisory Teaching</u>	
1. Play down the academic and instead encourage spontaneity in learning.	Use actual examples to illustrate.
2. Teach by doing. Use observation and experience learning situations to teach. Observing more experienced case aides has been a most useful technique.	
3. Use demonstration, such as role-playing. Let the case aide see and "feel" how the job is to be done.	Ask each participant to select a particular job or assignment which a case aide might do, and to prepare a brief 10 minute demonstration of how this assignment might be taught, using these principles. Plan to allow sufficient time for these presentations at the beginning of the next session. In discussing these demonstrations, the various ways in which these principles are applied should be identified and stressed.
4. Be clear and explicit. Give frequent illustrations, examples, explanations. Break the teaching of tasks down into its parts.	
5. Use condensed and simplified reading materials, as well as lists of steps case aide will take in performing an assigned task.	
6. Use a small group approach in the teaching of case aides wherever this is possible and appropriate.

Some case aides may be sensi they perceive to be the diff ment of clients on the part social service workers. Thu overidentify with some clien hostile toward social servic appear, to them, to be punit with clients. c. Some case aides may, initial difference between their ski of the caseworker because of that he has more concrete, d and, therefore, more usable of what it means to be poor. d. Some case aides are confused by professional attitudes, j which they do not understand

15771

Session 4 - SEEKING SOLUTIONS TO PROBLEMS	Comments, Suggestions
A. <u>Problems to be Anticipated</u> The addition of case aides, or for that matter any new group of staff, will create some problems for the agency, as it struggles to create a meaningful place for them.	Presentation and discussion of individual assignments made in the previous session should precede this content.
1. Some of the early difficulties which case aides have experienced in their new role of "employee"	Discussion can begin with a review of the content discussed in the previous session as a basis for anticipating problems.
a. Because of their prior dependency upon the agency and having had to live, as recipients, on a less than adequate income, some case aides may come with hostility toward or fearfulness of the agency.	Consider the four examples on pages 44 and 45 of Training Aid 38A. Pose question: How might you teach a case aide to handle such situations?
b. Some case aides may be sensitive to what they perceive to be the differential treatment of clients on the part of various social service workers. Thus, they may overidentify with some clients and become hostile toward social service workers who appear, to them, to be punitive in dealing with clients.	
c. Some case aides may, initially, see little difference between their skills and those of the caseworker because of their belief that he has more concrete, down to earth, and, therefore, more usable understanding of what it means to be poor.	Participants should be encouraged to discuss how they might handle such problems.
d. Some case aides are confused and isolated by professional attitudes, jargon, etc., which they do not understand.	

15771 15772

e. He may initially perceive of supervi a means of accounting for performanc a relationship through which learnin be derived from work experiences.

f. He may be easily impatient with proc which appear to limit his ability to help to clients.

g. Some mothers who have been on AFDC f quently bring noticeable hostile fee toward AFDC fathers, in general, whi can, if not handled, limit their abi to work with some families.

2. Some of the difficulties faced by the soc service worker as a result of the case ai presence.

a. The social service worker enjoys a c status in the agency. When the case does not meet his expectations, his reaction might be expressed in feel of anxiety and resentment.

b. There is a tendency to exert an und amount of control over what the cas does, because of a preoccupation wi the case aide can or cannot do. Su control is likely to stifle the aid ability to use natural ways of help

c. There is an uncomfortableness with aides more active, immediate, spont response to the client's needs. Th very different from the problem-sol approach used in social work practi

Comments, Suggestions

e. He may initially perceive of supervision as a means of accounting for performance, not a relationship through which learning can be derived from work experiences.

f. He may be easily impatient with procedures which appear to limit his ability to be of help to clients.

g. Some mothers who have been on AFDC frequently bring noticeable hostile feelings toward AFDC fathers, in general, which can, if not handled, limit their ability to work with some families.

2. Some of the difficulties faced by the social service worker as a result of the case aide's presence.

a. The social service worker enjoys a definite status in the agency. When the case aide does not meet his expectations, his reaction might be expressed in feelings of anxiety and resentment.

Consider the chart on page 36 of Training Aid 38A, and the orchestrational role suggested for the social service worker and eligibilit worker.

b. There is a tendency to exert an undue amount of control over what the case aide does, because of a preoccupation with what the case aide can or cannot do. Such control is likely to stifle the aides ability to use natural ways of helping.

c. There is an uncomfortableness with the aides more active, immediate, spontaneous response to the client's needs. This is very different from the problem-solving approach used in social work practice.

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VII. BRAKE SYSTEM

MILESTONE: II. MASTER CYLINDER

PERFORMANCE OBJECTIVE NO.: 2 TITLE: Overhaul Master Cylinder

CONDITIONS:

This assignment is to be performed on a complete automobile

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Raise hood
6. Place protective cover on fender over which you will be working
7. Disconnect hydraulic lines and other accessories from master cylinder following all steps as outlined in manual
8. Remove master cylinder following all steps as outlined in the manual
9. Disassemble master cylinder following all steps as outlined in the manual
10. Make all tests and checks as outlined in the manual
11. Reassemble master cylinder following all steps as outlined in the manual

PERFORMANCE CRITERIA:

case aides.

15777

f. Involve the social service worker in the training of the case aide, particularly through ways in which he can demonstrate a helping approach to clients.

g. Clarify your expectations of the new case aide.

h. Be guided by what is helpful to the client, rather than how help "should" be provided.

i. Raise, for discussion, problems which can affect staff ability to work together in helping the client.

3. <u>The Necessity of Providing Supportive Services</u>

1. Case aides may bring personal, family or social problems with them to the job assignment (i.e., child care problems, health problems, family conflict, etc.).

   a. The job assignment should not compound or enhance problems which do exist.

   b. Supportive services may frequently be needed and is an appropriate supervisory role.

   c. Supportive services can also be provided for through the group sessions planned for case aides.

15777 15778

References	Session 4 - SEEKING SOLUTIONS TO PROBLEMS
	2. Some questions to resolve. a. How will the confidentiality of rec assured when the aide has previousl recipient of county department serv financial assistance? b. How will case assignments be planne to eliminate the case aide's workin someone she already knows on a pers basis? c. Where a case aide may simultaneousl a service worker in the department be an agency client), what kinds of lines will be needed in determining supervisor's involvement in providi supportive services, and the respon ities of her worker in these same a d. Should a case aide work jointly in clients with the social service wor (or eligibility worker) whom he see "client" role?

15779

Session 4 - SEEKING SOLUTIONS TO PROBLEMS	Comments, Suggestions
2. Some questions to resolve. a. How will the confidentiality of records be assured when the aide has previously been a recipient of county department services or financial assistance? b. How will case assignments be planned so as to eliminate the case aide's working with someone she already knows on a personal basis? c. Where a case aide may simultaneously have a service worker in the department (and be an agency client), what kinds of guidelines will be needed in determining the supervisor's involvement in providing supportive services, and the responsibilities of her worker in these same areas? d. Should a case aide work jointly in helping clients with the social service worker (or eligibility worker) whom he sees in a "client" role?	These four questions are frequently a source of problems, particularly in the early use of case aides. The county director might be asked to join the group for this discussion, providing him with the opportunity to share with the group the specific administrative procedures which are to be used in such situations. The participants can also be divided into four smaller groups. Each group would be assigned one question to resolve, and to report back to the larger group the specific ways in which this question could be answered.

	Comments, Suggestions
c. In the teaching of initial tasks, they should be broken down into their parts, so that the aide clearly understands what steps he will be expected to take.	Teaching the case aide how to talk with clients (see Training Aid 38A, pages 31 and 32) can be used to consider how this task might be broken into its various parts.
d. Learning should primarily occur through activities followed by discussion which will reinforce the learning experience.	
e. Information which the case aide will need in performing his job assignment should be provided in simple, easily understandable terms, providing opportunity to question and identify examples from his own life experiences in seeking more complete understanding.	Consider the use of an observational experience on page 25 of Training Aid 38A, as one example of "teaching by example."
2. Some guidelines to early training	
a. Plan frequent, short conferences around each task to be assigned. Provide an opportunity for the case aide to discuss the individual steps involved in performing the task and, after its performance, discussing the experience.	Use actual examples to illustrate. Encourage participants to consider how these guidelines will be used in their actual teaching of case aides.
b. Early assignments must take advantage of and use a specific skill which the case aide has brought to the agency; and the assignment must be within his capacity - physically, emotionally, and educationally.	
c. Early assignments should involve the provision of concrete kinds of services which can be completed in one or two client contacts. Later, once success is achieved in this kind of activity, services involving a series of contacts can be introduced.

D. <u>Evaluation of Training</u> 1. A review of content covered. 2. Group task: Evaluate this training course and make recommendations which the group thinks are important. 3. Written assessment.	Group evaluation can be achieved by a free discussion with the trainer. Limit discussion to ten or fifteen minutes. A written assessment of the training course should also be developed and used to determine the degree to which the learning objectives listed on page 4 have been achieved.

ABSTRACT - Prepared by the Flight Standards Service of the Federal Aviation Administration, this study guide is an aid in preparing for the Basic or Advanced Ground Instructor Written Examination. Included in the guide are: (1) recommended study materials and outline, (2) a sample examination, (3) weather information, (4) a daily weather map, (5) aircraft description and performance data, and (6) sample exam-o-grams. Also included are the answers and related explanations for the sample examination. World Aeronautical Chart (405-Gila River) is intended for use with this guide. (JS)

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: I. CLUTCH

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Remove, Test, Replace, and Adjust Clutch

CONDITIONS:

This assignment is to be performed on a complete automobile - manual shift, three or four speed.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Position lift arms under frame of automobile
6. Raise automobile to proper working height
7. Remove drive shaft following all steps as outlined in the manual
8. Disconnect shift linkage from transmission following all steps as outlined in the manual
9. Disconnect other parts and accessories following all steps as outlined in the manual
10. Remove transmission following all steps as outlined in the manual
11. Remove clutch fork and throw-out bearing following all steps as outlined in the manual

PERFORMANCE CRITERIA:

GROUND INSTRUCTOR EXAMINATION GUIDE
BASIC—ADVANCED

Introduction

This study guide was prepared by the Flight Standards Service of the Federal Aviation Administration to assist applicants who are preparing for the Basic or Advanced Ground Instructor Written Examination. It is not offered as a quick and easy way to gain the knowledge necessary for passing the written examination. Knowledge and understanding are seldom gained quickly or easily. This is particularly true in the diversified field of aviation ground instruction. There can be no substitute for diligent study to attain basic knowledge, unremitting effort to develop competence, and continuous review to remain current in the many areas where technological change is the rule rather than the exception.

The purpose of this guide is to provide guidance for the serious student by outlining the scope of knowledge required. Thus, the student is better able to intelligently direct his study plan.

Nature of the Examination

Much of the information and knowledge required of the instructor in aviation ground subjects is essentially the same today as it was many years ago, yet there has been a gradual and definite change in some areas. Technological advancements and refinements in today's aircraft, plus the increased use made of their capabilities by the general flying public, have outmoded the practice of testing for memory alone. Of course, basic knowledge is still necessary but it must be related to the operationally realistic situation. An aircraft's primary commercial use is to provide safe, speedy, and efficient transportation and all civilian training, flight or ground, is directed toward this end. For this reason, knowledge must be related to skill, and skill is inextricably interwoven with knowledge. Therefore, written examinations today require the ability to use basic knowledge in practical situations as well as in answering questions based on theoretical problems.

For this reason, this examination guide will deal with questions that test for knowledge alone as well as questions that test for the ability to apply and use this knowledge in a realistic environment. Some of the questions will deal with specific subjects (navigation, radio navigation, meteorology, Federal Aviation Regulations, aircraft and powerplants) and test for basic knowledge and grasp of theory in regard to fundamentals of instructing. Other questions will require the ability to combine and synthesize knowledge in two or more of the specific subject areas.

The FAA Written Examinations your students will take are of similar format and nature with regard to requiring competence at practical application of theory and knowledge. Knowing this should enable you to organize course material and direct classroom efforts so that your students will be well prepared for their examinations.

Type of Examination Questions

The examination questions are of the objective, multiple-choice type as illustrated by questions in the sample examination. Each question can be answered on a special answer sheet with a pencil mark. To preclude the possibility of an applicant's receiving a failing grade because of a mistake in grading, all tests scored below passing are rechecked by trained personnel.

Taking the Examination

The equipment that the applicant will need for taking the examination includes a pro-

15809

15808

tractor or plotter and a computer. It is also desirable to have a pair of dividers. The applicant is allowed the following number of hours to complete the Ground Instructor Examination:

A. Basic ..... 4 hours
B. Advanced ..... 5 hours
C. Fundamentals of Instructing. 2 hours
(It is not necessary to take this on the same day as the Basic or Advanced Examinations.)

While it may be possible to complete in less time, it would be unwise to plan on this. If it becomes necessary to hurry in order to finish the exam, it will only increase the probability of mistakes.

Always bear in mind the following facts when you are taking the examination:

1. The questions are not trick questions. Each statement means exactly what it says. Do not look for hidden meanings. The statement does not concern exceptions to the rule; it refers to the general rule.

2. Always read the statement or question first—before you look at the answers listed below it. Be sure you read the entire question carefully. Avoid "skimming" and hasty assumptions. This can lead to a completely erroneous approach to the problem or failure to consider vital words.

3. Only *one* of the alternate answers given is completely correct. Other answers may be correct as far as they go, but are not complete or are answers based on erroneous assumptions, misconceptions, or incorrect procedures and interpretations. *Understand* the question or statement. *Then work out your* answer before choosing from the list of alternate answers the response which you consider to be the best.

4. Do not spend too much time on a question which you cannot solve or on one where you have considerable doubt as to the correct answer. By so doing you deprive yourself of the opportunity to mark all those questions which you can promptly solve or answer. You may always go back to the questions you skipped after you are through with all those which you can readily answer. Many times you could have answered 5 or 10 questions during the time you work with one that is difficult. The procedure which will enable you to make maximum use of time available can well mean the difference between a passing and failing score.

5. In working problems which require computations or use of the plotter and computer, select the answer which is closest to the result you get. Due to slight differences in individual computers and many small errors you may make in measuring distances, true courses, etc., it is possible that you will not get an exact agreement every time. However, sufficient spread is provided between right and wrong answers so that the selection of the answer closest to your solution will be the right choice, *providing* you have used correct technique and reasonable care in making your computations.

NOTE: When the test is constructed, the correct answers are "double-checked" by several types of computers. Any of the several types of computers which are commonly used throughout the country should prove satisfactory.

15809

RECOMMENDED STUDY MATERIALS

Aeronautical Charts

World Aeronautical Charts. (25 cents each)

Sectional Aeronautical Charts. (30 cents each)

Enroute Low Altitude Radio Navigation Charts. (25 cents each). This particular chart is not used on either the Basic or Advanced Examination, but instructor applicants and certificated instructors should be familiar with its format and use.

Flight Information

Airman's Information Manual. This publication presents, in three Parts, information necessary for the planning and conduct of flights in the U. S. airway system. Besides providing frequently updated airport and navaid data, the AIM includes instructional and procedural information, and is designed for use in the cockpit. Each Part is available on a separate annual subscription.

Part 1. *Basic Flight Manual and ATC Procedures.* ($2.00 domestic; $2.50 foreign — GPO) : combines the former Sections I and II and will be issued quarterly.

Part 2. *Airport Directory.* ($2.00 domestic; $2.50 foreign — GPO) : a revised version of former Section IV, expanded to include the physical description of those airports formerly shown only in Section IV-A. Will be issued semiannually.

Part 3. *Operational Data and Notices to Airmen.* ($9.00 domestic; $11.25 foreign—GPO) : presents former Sections III, III-A and IV-A every 28 days, supplemented by Section III-A (*Notices to Airmen*) every 14 days, midway of the 28-day cycle.

Handbooks and Technical Manuals

Private Pilot's Handbook of Aeronautical Knowledge. 1965. AC 61-23 ($2.75—GPO.) This handbook contains essential, authoritative information used in training and guiding private pilots. All subject areas in which an applicant may be tested are covered in the handbook. It tells how to use the Airman's Information Manual and the data in FAA approved airplane flight manuals, as well as basic instruments for airplane attitude control.

Personal Aircraft Inspection Handbook. Revised 1964. AC 20-9. (50¢—GPO). This is a general guide for inspection of aircraft; Part I deals with the fundamentals of inspection, and Part II covers a typical inspection in detail. As reliable inspection comes only with experience, it is emphasized that the use of this handbook by the novice does not qualify him to make final determinations regarding the airworthiness of the aircraft. This Handbook supersedes TM-101 dated 1950.

Flight Instructor's Handbook. 1964. AC 61-16. (60¢—GPO). This revised handbook is one of the primary sources of information and guidance for pilots preparing for the flight instructor written examination. It is basically a book which explains accepted theories and practices applicable to teaching and the learning process. Therefore, it will also prove most useful to those preparing for the Fundamentals of Instructing section of the Ground Instructor Written Examination.

Flight Training Handbook. AC 61-21. (70¢—GPO). This text deals with certain basic flight information such as load factor principles, weight and balance, and related aerodynamic aspects of flight, as well as principles of safe flight. The balance of the book provides information and direction in the introduction and performance of training maneuvers. Thus it serves primarily as a text for student pilots, for pilots improving their qualifications or preparing for additional ratings, and for flight instructors; however, it can also be useful to the ground instructor.

Navigation and Weather

Practical Air Navigation. 9th Edition, 1963. ($4.00). This is the revised commercial edition of CAA Bulletin No. 24. It provides a very comprehensive coverage of all subjects and areas dealing with navigation whether it be pilotage, dead reckoning, or radio and celestial navigation. Any student who understands the material avail-

15810

able in this highly recommended text will have no serious trouble with the navigation problems on his examination. This text may be obtained from many book dealers or from the publisher, Jeppeson & Co., 8025 East 40th Ave., Denver, Colorado 80209.

Aviation Weather. 1965. AC 00-6. ($2.25—GPO). This joint FAA/Weather Bureau publication supersedes and replaces "Pilot's Weather Handbook, TM-104," and provides an up-to-date and expanded text for pilots and flight operations personnel. It gives the pilot a practical understanding of those meteorological principles important to aviation and essential to his effective use of current weather and weather forecast information.

Weather Services for Pilots. 1962. (10 cents). This publication should do much to explain the weather services available through U. S. Weather Bureau stations and FAA Flight Service Stations. It explains in considerable detail weather reports and forecasts available and useful to pilots.

Federal Aviation Regulations

Part 1—Definitions and Abbreviations. (25 cents). This lists abbreviations and definitions to be used with the new Federal Aviation Regulations.

Part 61—Certification: Pilots and Flight Instructors. (50 cents). The applicant is responsible for the items in this Part which pertain to competency in all those areas which fall within the scope of knowledge required for his certification as a ground instructor.

Part 71—Designation of Federal Airways, Controlled Airspace and Reporting Points. (20 cents). The applicant will be directly concerned with this Part of the Federal Aviation Regulations dealing with airspace.

Part 91—General Operating and Flight Rules. (60 cents). It is imperative that the applicant be thoroughly familiar with the material contained in this Part, except those which pertain to Instrument Flight Rules.

Part 141—Pilot Schools. (25 cents). Although this Part of the Federal Aviation Regulations deals with pilot schools, it includes the regulations pertaining to ground schools with which the applicant should be familiar. General knowledge of various aspects of pilot school requirements will be of considerable value to the applicant.

Part 143—Ground Instructors. (15 cents). This short Part to the Regulations prescribes the requirements for issuing ground instructor certificates and associated ratings, and the general operating rules for the holders of those certificates and ratings.

National Transportation Safety Board

Safety Investigation Regulations, Part 320. May 18, 1966. (5 cents). This publication deals with procedures required in dealing with accidents and lost or overdue aircraft in the United States, its territories, and possessions.

Training Aids

Commercial Pilot Examination Guide. 1966. AC 61-25 (75 cents). This guide gives detailed information on the scope and depth of knowledge required of the commercial pilot applicant.

How to Obtain Study Materials

All study material, except charts and *Practical Air Navigation* may be obtained by remitting check or money order to:

Superintendent of Documents
U. S. Government Printing Office
Washington, D. C. 20402

Charts may be obtained at most local airports, or by remitting check or money order to:

Coast and Geodetic Survey
ESSA
Rockville, Maryland 20852

In many instances, the above materials may be obtained at airports or from book stores.

In addition, there are many other excellent commercially prepared textbooks, audio-visual training aids, and other instruction materials which may be helpful in preparation for the examination.

NOTE: The items listed were available or in preparation at the time this publication went to press.

15811

STUDY OUTLINE FOR THE GROUND INSTRUCTOR WRITTEN EXAMINATION

The study outline which follows is the framework for basic aeronautical knowledge that the prospective ground instructor must know; *every question* on the FAA examination can be *directly* related to one or more of the topics contained in this outline. This subject matter is predicated on both theoretical questions in specific areas and on operationally realistic airman activity, and encompasses the knowledge requirements specified in Federal Aviation Regulations.

Section 1 — Fundamentals of Instructing

I. The Ground Instructor — Desirable Qualities.
   A. Good attitude toward teaching.
      1. Desire to do a competent job.
      2. Ability to develop and improve.
      3. Sincerity, enthusiasm, and patience.

II. The Pattern for Instruction—How to Guide the Learning Process.
   A. *Understand* the factors, conditions, and principles which guide the learning process.
      1. Establish clear objectives.
      2. Provide for student participation.
      3. Develop understanding and insight.
      4. Develop ability to think and reason through use of known facts.
      5. Use of motivation, presentation, trial performance and evaluation.

III. Planning—Vital to Teaching Success.
   A. Diagnose present student ability and ability desired upon completion of course.
   B. Arrange teaching sequence to "make sense".
      1. Proceed from the known to the unknown.
      2. Proceed from the easy to the difficult.
      3. Plan so student will see necessity and logic of each succeeding step.
      4. Use a lesson plan—know its advantages.

IV. Presentation—Procedure to Follow.
   A. Plan.
      1. Student-instructor relations — establish an atmosphere of cooperation.
      2. Direct and explain.
      3. Discuss.
         a. Get *all* students to participate.
         b. Keep discussion moving toward goal.
         c. Emphasize important points.
         d. Keep explanation short, clear, and to the point.
      4. Question technique—its use and importance.
      5. Use analogies as a link between known and unknown.
      6. Use instructional aids.

V. Performance, Practice, and Application.
   A. Steps to follow.
      1. Start with the easy and work toward the difficult.
      2. Make performance realistic.
      3. Guide student's efforts.
      4. Get each student to participate.
      5. Relate performance to previous explanations and directions.
      6. Provide adequate practice but guard against blind "trial and error".

15812

7. Evaluate student progress.

VI. Motivation--Basic to All Learning.
- A. Reward—use and limitations.
- B. Immediate and long-range goals and their relative usefulness.
- C. Arousing interest.
  1. Use of student's background.
  2. Use of your own experience and background.
  3. Use of anecdotes and stories.
- D. Conditions detrimental to good motivation.
  1. Self-consciousness.
  2. Antagonism.
  3. Impatience.
  4. Worry.
  5. Physical discomfort.
  6. Boredom.

VII. Teaching Methods and Techniques.
- A. Telling—sometimes called the "lecture" method.
  1. Does not permit student participation.
  2. Can be combined with other methods to make it more effective.
- B. Discussions—techniques of.
  1. Develop cooperative spirit.
  2. Clarify problems.
  3. Encourage participation.
  4. Avoid dominating discussion.
  5. Summarize frequently.
- C. Demonstrations or showing.
  1. Must be combined with telling.
  2. Advantages.
     - a. Makes explanations concrete.
     - b. Aids student understanding.
     - c. Saves learning time.
     - d. Effective with large groups.
     - e. Gives students over-all perspective.
     - f. Appeals to several senses.
     - g. Has dramatic appeal.
- D. Performing or Doing—Essential to the Learning Process.
  1. Techniques.
     - a. Plan the performance.
     - b. Prepare the student for performance.
     - c. Guide the performance.
     - d. Give individual attention.
     - e. Evaluate the performance.
     - f. Have the student evaluate the performance.
     - g. Practice the performance.
     - h. Supervised study—a form of performance.
       - (1) Survey — student must get a picture of the problems.
       - (2) Assign reading material.
       - (3) Student must practice self-questioning.
       - (4) Recite.
       - (5) Review — necessary to develop and firmly fix learning and improve weakness revealed by recitations.
       - (6) Critique — an analysis of performance.
- E. Test Administration Procedures — Preceding, During, and After Student Participation.
  1. Preceding.
     - a. Be on time.
     - b. Check tests for errors.
     - c. Give clear instructions.
     - d. Create relaxed atmosphere.
  2. During.
     - a. Avoid distractions.
     - b. Limit student discussions.
     - c. Be alert to student need for permissible assistance.
  3. After.
     - a. Review.
     - b. Permit constructive student criticism—written and oral.
- F. Evaluation — The measure of Success of the Teaching Program.
  1. What to test.
     - a. Understanding.
     - b. Actual performance—ability to apply knowledge to realistic problems is the only positive assurance of mastery of subject.
  2. Characteristics of Good Evaluation Devices.
     - a. Validity — does it measure what it is supposed to measure?

15813

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: I. CLUTCH

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Remove, Test, Replace, and Adjust Clutch

CONDITIONS:

BEHAVIOR:

12. Remove pressure plate and clutch following all steps as outlined in the manual
13. Perform all checks and tests as outlined in the manual
14. Replace pressure plate and clutch disc following all steps as outlined in the manual
15. Replace clutch fork and throw-out bearing following all steps as outlined in the manual
16. Replace transmission following all steps as outlined in the manual
17. Reconnect all parts and accessories following all steps as outlined in the manual
18. Reconnect shift linkage following all steps as outlined in the manual
19. Replace drive shaft following all steps as outlined in the manual
20. Perform all tests, checks, and adjustments following all steps as outlined in the manual
21. Lower automobile to the floor

PERFORMANCE CRITERIA:

b. Reliability — are the results consistent?
c. Objectivity — limit personal judgments.
d. Differentiate — test must measure small but significant differences in achievement.
e. Comprehensive — provide adequate sampling.

3. Types of tests.
a. Multiple-choice.
b. Matching.
c. True-False.
d. Completion.
e. Essay.

G. Instructional Aids—Choose the Aid that Fits the Learning Situation.

1. Usual types of aids.
a. Films, strips, slides.
b. Training graphics — diagrams, charts, pictures, etc.
c. The blackboard.
d. Training devices—mockups, schematics, operational, sectionalized, and exploded.
e. Training literature.
f. Field trips.

2. Caution in the use of instructional aids.
a. Contribute little unless they develop student understanding.
b. Don't expect them to do your teaching.

VIII. Student-Instructor Relationship.

A. Establish receptive, cooperative working relationship.
1. Be natural, enthusiastic, and helpful.
2. Realize you are dealing with men, not machines.
3. Be a guide, not a driver.
4. Treat students as adults — do not talk down to them.
5. Be fair, firm, and friendly.

B. Additional suggestions for establishing atmosphere conducive to learning.
1. Show no partiality or favoritism.
2. Never try to bluff.
3. Never harshly criticize in front of others.
4. Acknowledge your own mistakes.
5. Act decisively.
6. Keep student headed toward his objective.
7. Be interested in your pupils as individuals.
8. Be courteous.
9. Recognize and reward excellence.
10. Encourage class participation.
11. Encourage initiative and self-reliance.

Section 2 — Aeronautical Knowledge

I. Preflight — Activities Relating to the Proposed Cross-Country Flight.
During the preflight portion of the examination you will be required to perform most of the following activities which are directly related to the proposed cross-country flight:

A. Lay out the proposed route on the aeronautical chart provided with the examination.
1. Follow the instructions given in the examination and draw the course lines for the proposed route.
2. Determine the true courses with a protractor and measure distances, *using the mileage scale at the bottom of the chart.* For accurate measurement, use the center of the airport symbols—not the edge.
3. Study the area along your proposed route and note the locations of the following:
a. *Prominent* checkpoints.
b. Radio aids to navigation (VOR, nondirectional radio beacons, and L/MF range stations). Be certain to

158[illegible]

check this data against current information in the *Airman's Information Manual.*

c. High terrain (particular attention should be made to note the elevations—heights above sea level — of the higher ridges and peaks along the routes that traverse rough or mountainous country).

d. Obstructions (note the elevations of high obstructions enroute and in the vicinity of destination landing fields).

e. Control areas, control zones, and airport traffic areas.

f. Prohibited, restricted, caution, and warning areas.

B. Check the weather. Consult your local Weather Bureau Airport Station, or an FAA Flight Service Station for flight weather briefings. Be able to read and interpret the following data:

1. Surface weather map. (Identify fronts, air masses, and read station model data, using the key furnished in the examination.)
2. Area forecasts.
3. Terminal forecasts.
4. Winds-aloft forecasts.
5. SIGMETS (significant meteorological developments) and AIRMETS (formerly designated "Advisories for Light Aircraft", they include weather phenomena of less severity than that covered by SIGMETS).
6. Hourly Sequence Reports.

C. Review the important data in the flight planning publication — *the Airman's Information Manual.* Be familiar with and able to use the information pertaining to:

1. Communication frequencies: control towers, approach control, primary traffic control, ground control, departure control, Flight Service Stations.
2. Navigation aid frequencies: VOR Stations, nondirectional radio beacons, L/MF Range Stations, VHF/DF, Radar.
3. NOTAMS (Notices to Airmen).
4. Special Notices: list of Military Climb Corridors and Oil Burner Routes, good operating practices, and other helpful information.
5. Airport data: location, runway information, availability of fuel and service, availability of UNICOM and weather reporting facilities, etc., lighting.
6. Review pertinent information on:

a. Enroute Cruising Altitudes.

b. Airport Traffic Control procedures.

c. Light Gun Signals.

d. Radio-telephone phraseology and techniques.

e. Complete list of VOR receiver checkpoints.

f. Enroute communications.

g. U. S. Aircraft Emergency procedures, search and rescue procedures, emergency SCATANA rules (Security Control of Air Traffic and Air Navigation Aids).

h. U. S. Weather Bureau telephone numbers.

i. FAA Flight Standards District Office telephone numbers.

j. Aircraft accident reporting.

D. Check your aircraft equipment and records, and your personal qualifications to see that regulations have been met.

1. Check to see that your aircraft—

a. Has the required documents aboard.

b. Has had the necessary in-

1581581

spections within the required time.

c. Is properly equipped for flight (including operations at night and operations in and out of airports on which United States Government-operated control towers are located).

2. Check your pilot qualifications to ascertain that—

a. You have the proper pilot and medical certificates.

b. You have complied with recency of experience requirements for carrying passengers (day and night).

E. Select your cruising altitudes, taking into consideration—

1. Regulations with regard to the hemispherical rule (semi-circular rule).
2. Enroute terrain and obstruction elevations.
3. VFR cloud separation requirements.
4. Winds aloft.
5. Restricted areas such as Military Climb Corridors. (For additional information concerning ing prohibited, restricted, caution, and warning areas, see reverse side of your chart.)

F. Review your *Airplane Flight Manual* and *Owner's Handbook*.

1. Understand the difference between normal and utility category.
2. Consult the weight and balance data and determine that the aircraft is properly loaded. Know how to compute empty weight, useful load, gross weight, and moments.
3. Check on the grade and quantity of fuel and oil required.
4. Review flight load factor limitations and airspeed limitations.
5. Check your performance charts as required for—

a. Takeoff data (*Airplane Flight Manual* or *Owner's Handbook* charts or Denalt Performance Computer.

b. Climb data.

c. Landing distance data.

d. Cruise performance data (cruise power settings, approximate true airspeeds, fuel consumption rate).

e. Airspeed calibration table.

f. Stall speed vs. angle of bank table.

G. Compute navigation data for the flight based on selected cruising altitudes, cruise performance data from the *Airplane Flight Manual* or *Owner's Handbook*, and the appropriate winds aloft.

1. Convert the forecast winds aloft which are given in knots to miles per hour (also convert, when required, temperatures given in Centigrade to Fahrenheit or vice versa). Interpolate for winds (and temperatures) at intermediate altitudes.
2. Compute true headings and convert to magnetic headings by applying the appropriate magnetic variation corrections. Convert magnetic headings to compass headings by applying correction for deviation.
3. Compute estimated groundspeeds and estimated times enroute.
4. Compute estimated fuel required for flight based on estimated times enroute and the aircraft cruise performance charts.
5. Compute normal range and maximum range based on Cruise Performance Charts. Compute range with reserve allowance.
6. Make a thorough visual inspection. During this inspection, drain a generous amount of fuel from your fuel supply (fuel strainer and wing tank sump

15816

drains), and inspect for evidence of water contamination. If ice, snow, or frost is on the aircraft, remove completely.

H. Follow the recommended procedures in filing your VFR flight plan.

NOTE: Except for knowledge and interpretation of instruments in relation to *attitude control* of the airplane, the Basic and Advanced Ground Instructor Written Examinations will deal only with flight under VFR conditions.

II. Preflight—Basic Aeronautical Knowledge Indirectly Related to the Proposed Cross-Country Flight.

During the preflight portion of the examination, you will be questioned on additional aeronautical subjects. Some of these subjects may not directly relate to the proposed cross-country flight, but they are germane to the various airman certificates and ratings. These subject areas include:

A. Weather. As a ground instructor, you should demonstrate a broad understanding of weather. You should be familiar with—
   1. Basic concepts of the earth's atmosphere and the composition of air.
   2. Types of clouds and associated weather phenomena.
   3. General circulation patterns (winds).
   4. Air masses.
   5. Low and high pressure centers.
   6. Frontal weather (weather conditions generally associated with cold fronts, warm fronts, occluded fronts, etc.).
   7. Thunderstorms.
   8. Ice and turbulence.
   9. Fog and other visibility obscurations.
   10. Meteorological terminology (definitions).

B. Navigation. You should understand the following:
   1. The earth and its coordinates of latitude and longitude.
   2. Chart projections used for air navigation (with emphasis on the properties of the Lambert Conformal Conic Projection).
   3. Map reading.
   4. Dead reckoning.
      a. Wind triangle (vector) problems.
         (1) Determine true course and groundspeed.
         (2) Determine true heading and groundspeed.
         (3) Determine wind direction and velocity.
         (4) Determine true heading and true airspeed.
         (5) Off-course corrections.
      b. True course to compass heading.
      c. Compass heading to true course. (Application of wind, variation, and deviation corrections.)
      d. Speed—time—distance problems.
      e. Knots—m.p.h. conversions.
      f. Nautical — statute conversions for both speed and distance.
      g. Rates of climb and descent computations.
      h. Airspeed and altitude corrections.
      i. Centigrade—Fahrenheit conversions.
      j. Estimated time of arrival (ETA), estimated time enroute (ETE), and arrival scheduling.
      k. Cruise control.
      l. Use of flight log (preflight and in-flight).
   5. Radio navigation as it pertains to VFR flight. (See item E.)
   6. Navigation terminology (definitions).
   7. The vital relationship between weather phenomena and problems of navigation.

C. Aerodynamics and Principles of

15817

Flight. You should demonstrate a knowledge of—

1. Forces acting on an aircraft.
2. Principles of basic maneuvers.
3. Aircraft performance and factors affecting performance (with emphasis on the effect of density altitude on aircraft performance).
4. Static and dynamic stability (longitudinal and lateral).
5. V_y and V_x speeds.
6. Terminology and definitions.

D. Airframe and Powerplant. You should have a working knowledge of—

1. Aircraft structures.
2. Airframe components and control surfaces.
3. Fuel and fuel systems.
4. Oil and oil systems.
5. Electrical system fundamentals.
6. Reciprocating engine principles and components.
7. Carburetion and fuel injection.
8. Ignition.
9. Propellers.
10. Engine instruments.
11. Engine controls (throttle, propeller, mixture, carburetor heat, cowl flaps, etc.).
12. Relationship between r.p.m. and manifold pressure.
13. Brake mean effective pressure (BMEP), and its significance.

E. Radio Equipment. You should understand the basic characteristics, operations, frequency ranges, advantages, and limitations of—

1. VHF Communications Equipment. Understand the "line of sight" range of transmissions. Understand that an operative transmitter and receiver are all that are required to use VHF Direction Finding Service and radar assistance from ground stations. (In some instances, assistance may be available even when all radios are out if proper procedures are followed.)
2. VOR Equipment.
   a. Understand principle of VOR operation. Be able to recognize a usable signal.
   b. Know the components of your VOR receiver and the importance of proper tuning.
   c. Understand that a radial is a line of magnetic bearing extending *from* a VOR.
   d. Understand how to utilize receiver checkpoints to establish receiver accuracy.
   e. Be able to work a VOR orientation. Understand how to determine your approximate position relative to the station by interpreting the setting of the omni-bearing selector, the position of the LEFT-RIGHT needle, and the indication of the TO-FROM indicator. Understand the importance of correct "sensing".
   f. Know and understand the procedures for VOR off-course navigation and for solving time and distance problems.

*3. L/MF Range and ADF.
   a. By referring to your chart, be able to determine the magnetic direction of the four legs of low frequency ranges and the relative position of the "A" and "N" quadrants.
   b. Know how range legs are numbered, why average quadrant bisectors are used, and how they are obtained.
   c. Know the types of markers used with the L/MF range and their functions.
   d. Understand nondirectional beacons—their use, classification and range.

* Applicable primarily to Ground Instructor-Advanced Examination.

15818

e. Understand how to interpret bearing information when using your ADF for tracking inbound and outbound and for track interception.
(1) Relative Bearings.
(2) Magnetic Bearings.
(3) True Bearings.

F. Flight Instruments. You should understand the basic principles of operation and characteristics of all flight instruments.

1. Understand the basic similarity between visual and instrument flying with regard to control of aircraft attitude.
2. Be able to interpret the pitch-and-bank attitude of your aircraft by reference to the flight instruments.
3. Understand the bowl-type magnetic compass.
   a. Know the method of making turns by referring to the magnetic compass to determine the lead point at which to begin rolling out.
   b. Understand the following errors of the bowl magnetic compass:
      (1) Deviation.
      (2) Oscillation error.
      (3) Magnetic dip error. Dip error is responsible for:
         (*a*) *Northerly turn error* which is most pronounced on northerly and southerly headings; and
         (*b*) *Acceleration error* which is most pronounced on easterly and westerly headings.
4. Thoroughly understand the altimeter (sensitive altimeter adjustable for changes in barometric pressure).
   a. Know the effect of nonstandard temperature and pressure on the indications of the altimeter.
   b. Understand how to apply altimeter settings to the altimeter setting window of the altimeter.
   c. Be able to interpret the indications of the altimeter.
   d. Know how to determine pressure altitude.
5. The Airspeed Indicator. Know the eight airspeed ranges and limitations that are reflected by the standard marking system on the face of the airspeed indicator (white, green, and yellow arcs, and the red line).
   a. Flap operating range.
   b. Normal operating range.
   c. Caution range.
   d. Power-off stalling speed with the wing flaps and the landing gear in the landing position (V_{so}).
   e. Power-off stalling speed "clean"——wing flaps up and landing gear retracted (V_{s1}), if equipped with a retractable landing gear.
   f. Maximum flap extended speed (V_{fe}).
   g. Maximum structural cruising speed (V_{no}).
   h. Never-exceed speed (V_{ne}). (See fig. 27 in appendix.)

III. Prestarting Inspections.

A. Exterior Visual Inspection. Understand the importance of—

1. The use of a checklist in establishing good habit patterns.
2. Allowing sufficient time for a thorough and complete walk-around inspection as recommended by the aircraft manufacturer.
3. The emphasis placed on checking for, and adequate drainage of, possible fuel contamination.
4. Checking the pitot tube and static pressure orifice.
5. Ice, snow, and frost removal from the aircraft.

15819

IV. Starting, Taxiing, and Engine Runup.

A. Understand the need for—

1. Following a checklist based on manufacturer's recommendations.
2. Familiarity with emergency procedures with regard to engine or induction system fires.
3. Ground control or tower contacts where applicable for taxi clearance.
4. Careful observance of the oil pressure/temperature, and magneto checks; and where applicable, check on fuel pressure, cylinder head temperature, r.p.m., manifold pressure, flaps, trim, and full control travel in the proper direction.
5. Courtesy in control of propeller blast in taxiing and runup where proximity of other aircraft, buildings, and personnel are involved.

V. Takeoff.

A. Use your checklist.

B. Contact tower for takeoff clearance but check traffic carefully yourself. You are still responsible for the safety of your operation.

C. Activate any VFR flight plan by reporting time off to appropriate facility.

D. Be certain you clearly understand tower instructions.

E. Follow tower instructions without deviation except when cleared to do so, or in an emergency.

F. Check density altitude/performance.

G. Use takeoff performance charts. (See fig. 12 in the appendix.)

VI. In-Flight.

A. Climb to your selected altitude and complete your level-off procedures. Take necessary precautions to ensure accuracy when making readings from the bowl magnetic compass. Reset the gyro-driven heading indicator to the magnetic compass frequently.

B. Comply with FAR 91, *General Operating and Flight Rules*, at all times. Maintain a constant vigilance for other traffic.

C. Compute estimated true airspeeds and true altitudes. Be forever alert to density altitude, etc.

D. Determine time between checkpoints and compute groundspeed. Compute ETA over various checkpoints and destination. Keep log of time over various points.

E. Use good fuel management procedures. Keep close check on fuel consumption rate. Maintain proper fuel/air mixture setting appropriate to cruising altitude through proper use of mixture control.

F. If the winds-aloft forecast proves inaccurate, or if you drift off your flight-planned course, compute new headings and groundspeeds to destination from your present position.

G. Make periodic VFR position reports to Flight Service Stations. Give PIREPS (Pilot Reports) on unusual weather or erratic operation of radio navigation aids. Request weather information if necessary.

H. Be able to follow L/MF Range Legs and VOR radials.

I. Know how to tune in and identify a radio range or VOR station. Understand how to utilize an air navigation radio aid, i.e., VOR radial, L/MF range leg, and ADF bearing.

J. Have a working knowledge of the procedures for requesting radar vectors, D/F steers and associated enroute emergency navigation assistance.

K. Monitor appropriate stations for 15 minutes after the hour (area) and 45 minutes after the hour (airway) weather broadcasts. Maintain a continuous listening watch for possible in-flight weather safety advisories (SIGMET or AIRMET).

L. When operating in the vicinity of a large aircraft, be on the alert for wing-tip vortices (wakes of ex-

15820

treme turbulence behind aircraft). Take recommended action if you inadvertently encounter wing-tip vortices.

M. Avoid bad weather. Do not get trapped above an overcast. When necessary, use the 180° turn, but this device is reliable only when you have not waited too long to make the decision to turn.

N. Avoid turbulent air if possible. If you encounter severe turbulence, slow the aircraft to at least the recommended maneuvering speed.

O. Keep a continuous watch of all engine instruments. Be able to recognize symptoms of carburetor icing. Remember that, on aircraft equipped with constant speed propellers, the initial loss of power will be reflected by decreased manifold pressure, not by loss of r.p.m. due to action of propeller governor.

P. When making in-flight power adjustments, sequence your throttle and propeller controls in the correct order. Remember BMEP tolerances.

Q. Be prepared for in-flight emergencies—equipment failure, loss of orientation, or unexpected weather. Have alternate plans of action.

R. If you cross a Military Climb Corridor, be sure to fly at an altitude appropriate to the segment crossed.

S. If you take off or land at an airport located within an airport traffic area, follow applicable Regulations.

T. Know the official sunset time for the area over which you are flying. Turn your navigational lights on at the required time. Be familiar with airport lighting, runway lighting, and taxiway lighting.

U. Prior to starting your letdown, check to see that fuel selector is on the appropriate tank, and mixture control is in proper position. Take necessary precautions to avoid possible carburetor icing during prolonged letdowns at reduced power settings.

V. When approaching your destination, contact the tower for landing instructions. Be able to interpret instructions. (For example, if you are instructed to land on "RUNWAY 22 RIGHT TRAFFIC", you should understand you are to land on a runway with magnetic direction of 220°, using a right-hand traffic pattern.)

W. Use standard practice when entering traffic. Watch for light gun signals from the tower, in the air, or on the ground if your radio receiver becomes inoperative. Maintain a constant vigilance for other traffic. Be alert for segmented marker system or flashing amber light as indications of non-standard traffic.

X. Run a complete prelanding check, *using your checklist.*

Y. Understand the purpose and use of the Visual Approach Slope Indicator (VASI).

Z. After landing, switch to the appropriate ground control frequency if applicable (*after* turning off the active runway), and exercise extreme caution while taxiing back to ramp.

VII. Post-Flight Activities.

A. Turn off all switches and secure the controls.

B. Close your flight plan with the appropriate facility if you have not done so.

C. Refuel the aircraft in order to reduce condensation in the tanks and possible water contamination of the fuel.

D. If applicable, arrange for hangar space or tie-downs.

E. Understand procedures for notification and reporting of aircraft accidents and overdue aircraft as specified in Safety Investigation Regulation Part 320.

F. Record your flight time. (Not mandatory except to verify recent experience or to substantiate claim to experience necessary for grade of certificate or rating sought.)

THE SAMPLE EXAMINATION

The following test items are included for one purpose—to familiarize you with the type of questions you may expect to find on FAA examinations. Keep in mind that these few sample items do not include all of the topics on which you will be tested in the FAA examination. For this reason you should concentrate on the section entitled "Study Outline for the Ground Instructor Written Examination." A KNOWLEDGE OF ALL THE TOPICS MENTIONED IN THIS OUTLINE—NOT JUST THE MASTERY OF THE SAMPLE TEST ITEMS — SHOULD BE USED AS THE CRITERION FOR DETERMINING THAT YOU ARE PROPERLY PREPARED TO TAKE THE FAA WRITTEN EXAMINATION.

The appendix of this booklet contains the supplementary materials which will be required from time to time during the sample examination. These materials include weather information, aircraft description and performance data, the flight planning data (excerpted information from the *Airman's Information Manual,* diagrams, charts, and illustrations).

This examination is divided into two sections. The first section tests for basic knowledge in *Fundamentals of Instructing.* It is necessary that an applicant for a Ground Instructor certificate pass a written examination dealing with the conditions, techniques, and principles which control the learning process. This examination is separate from, and in addition to, the written examination on subjects which pertain to the rating he seeks (Basic, Advanced or Instrument). The applicant may, if he chooses to do so, take this written examination on the same day that he takes the examination on the subjects covered by the rating sought. However, he may take it on another date before taking the written examination on subjects pertaining to the rating sought. Regardless of his choice as to when he takes this examination, *both* sections must be passed by an applicant. It is *not* necessary, however, to take the examination on *Fundamentals of Instructing* for each additional rating sought. For example, if an applicant for the Basic Ground Instructor rating passes both the section on *Fundamentals of Instructing* and the section pertaining to Navigation, Meteorology, Federal Aviation Regulations, Aircraft and Engines, it is not necessary for him to again pass the section on *Fundamentals of Instructing* to obtain either the Advanced Ground Instructor rating or the Instrument Ground Instructor rating. He only needs to pass an examination on the subject matter pertaining to the rating he seeks.

The second section of the sample examination is based on an operational realistic cross-country flight where general knowledge must be applied to practical situations. Answers and explanations to the questions which follow may be found on page 25 through page 30.

15822

SAMPLE EXAMINATION

Section 1 — Fundamentals of Instructing

1. Test reliability refers to the
   1——characteristic of a test which indicates consistent results for a test over a period of time.
   2——measure of temporary variations influenced by chance errors.
   3——accuracy with which an examination identifies the superior students.
   4——exactness with which a test measures what it is supposed to measure.
2. If an instructor wishes to do an effective job of teaching, the most important requirement is that he master
   1——only teaching methods.
   2——only his subject matter.
   3——both teaching methods and subject matter.
   4——public speaking technique.
3. One of the most significant sources of information for an instructor with regard to the need to develop new and better ways of improving his teaching effectiveness lies in
   1——noting whether a comparison between his methods and those used by successful teachers is favorable or unfavorable.
   2——the observations and suggestions made by supervisors and other instructors.
   3——the observation and evaluation of the difficulties which his students are having.
   4——listening to student's suggestions.
4. Good instruction techniques involve many important elements. Select the answer which includes only those items important to good instruction.
   A. Evaluate the student and recognize his difficulties as an individual.
   B. Instruct each class in exactly the same manner so as to assure a constant level of student proficiency.
   C. Set specific goals.
   D. Avoid setting standards of performance lest failure to meet them prevents progress.
   E. Acquaint the student with his progress only if he seems concerned about the matter.
   F. Keep student informed of his progress.
   G. Allow the student to participate in the class session and demonstrate his ability, but anticipate mistakes, and if possible correct them before they occur.
   H. Use a teaching sequence that "makes sense" from the learner's point of view.
   I. Improve motivation through use of negative incentives.
   J. Use oral questions in the classroom to evaluate progress and level of learning.
   K. Use a lesson plan even if it is inadequate.
   L. Emphasize the lecture method of instruction.
   M. Limit classroom practice as much as possible since it consumes too much time.
   1——A, C, F, H, J, K.
   2——B, D, E, G, I, L, M.
   3——A, D, E, H, L.
   4——C, F, G, H, K.
5. True comprehension and understanding of a subject is the very essence of any learning. The best way to determine if a student really understands a subject is to
   1——accept a high grade average as evidence of such understanding.

15823

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: I. CLUTCH

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Remove, Test, Replace, and Adjust Clutch

CONDITIONS:

BEHAVIOR:

22. Make final tests and adjustments following all steps as outlined in the manual
23. If final tests and checks are satisfactory, return tools and materials to proper place
24. Return automobile to proper parking area
25. Remove covers from front seat and store in proper place
26. Clean work station for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily remove, test, replace, and adjust clutch in 3 hours.

Learning time: 4 hours

1528

2——give examinations which require high levels of retention in order to make a good grade.

3——ascertain that the student can actually apply his knowledge to all the problems covered in the classroom program.

4——test the student's ability to apply his knowledge toward solving new and difficult situations.

Section 2 — Aeronautical Knowledge

This part of the examination is based on a flight from Gallup, New Mexico, to Holbrook, Arizona, to Flagstaff, Arizona, and to Williams, Arizona.

Although this is a hypothetical cross-country, the weather data is authentic. The airplane you are assumed to be flying is a late model, 4-place, single-engine airplane. It is equipped with retractable, tricycle landing gear and a constant speed propeller. It is typical of several models currently being produced by various manufacturers. This airplane is designated as DAEDALIAN DART 2468–W. It is to be flown in accordance with FAA-approved Airplane Flight Manuals and placards that appear in the airplane.

PROPOSED CROSS-COUNTRY FLIGHT DATA

You are a professional pilot employed by an engineering corporation whose home office is in Gallup, New Mexico. You are scheduled for a flight originating in Gallup, New Mexico, and terminating in Williams, Arizona, with intermediate stops at Holbrook, Arizona, and Flagstaff, Arizona.

You will carry three corporation executives who are conducting a business survey. You have established your tentative route on WAC Chart 405 as follows:

LEG I

McKinley County Airport, Gallup, New Mexico, to Holbrook Municipal Airport, Holbrook, Arizona, via direct route.

LEG II

Holbrook Municipal Airport, Holbrook, Arizona, to Flagstaff Municipal Airport, Flagstaff, Arizona, via direct route to Winslow, Arizona, VORTAC; thence direct route to Flagstaff Airport.

LEG III

Flagstaff Municipal Airport, Flagstaff, Arizona, to Williams Municipal Airport, Williams, Arizona via direct route.

Except for Gallup, New Mexico, the places named can be located in respect to the closest town by reference to the excerpt from the *Airman's Information Manual,* figure 18, in the appendix.

Your preflight activities include:

1. Any necessary review of the *Airplane Flight Manual, Operation Placards,* and *Owner's Handbook,* with particular emphasis on operating speeds, power and mixture settings, weight and balance considerations, and emergency procedures.
2. A study of pertinent information in the *Airman's Information Manual.*
3. A review of your map with emphasis on the relationship between your route and airway structure, terrain and obstruction elevations, and all airport facilities available enroute in event of emergency.
4. A review of radio checkpoints and facilities.
5. Thorough check of all available weather information.
6. Filing a flight plan.
7. Preflight check of the airplane.

---

1. Federal Aviation Regulations require careful preflight planning

1——only on flights that are conducted off-airways.

2——on all cross-country flights.

3——only on flights for hire.

4——only on flights which carry passengers.

2. According to the 0700 Hourly Sequence Report (see fig. 5 in the appendix),

1——PHX reports a ceiling of 12,000 feet.

2——PRC reports a pressure of 906.4 millibars.

3——TUS reports an altimeter setting of 39.83 inches.

4——GNT reports calm surface winds.

3. The 0800 Hourly Sequence Report at Phoenix, Arizona, (see fig. 5) indicates that

1——the ceiling is 10,000 feet.

2——the ceiling is 1,200 feet.

23 10324

3——the ceiling is 12,000 feet.
4——there is no reported ceiling at Phoenix.

4. You plan to depart at 0830 MST and a study of all the Hourly Sequence Reports in figure 5 permits you to conclude that

1——you have no weather problem with regard to the flight.
2——you can anticipate frontal activity between *0700* MST and *0800* MST.
3——ceilings will decrease along the route.
4——you are unable to ascertain what the weather is likely to do in the next few hours.

5. A study of *all* the weather information *available* to you before you start the flight (see figs. 3, 4, and 5 of the appendix) will allow you to deduce that

1——it is not possible to estimate what the weather is likely to do in the next few hours.
2——turbulence and surface winds are likely to be your principal enroute weather problems.
3——scattered thunderstorms will probably occur along your route before *1200* MST.
4——it would be best to fly as low as terrain and obstruction clearance will permit because of more favorable winds.

6. Your World Aeronautical Chart 405 is based on the Lambert Conformal Conic Projection, a chart projection which is much used for aeronautical charts because

1——scale errors are small, so for all practical purposes, scale may be considered constant over a single sheet.
2——it affords a simple and satisfactory solution for all problems of navigation, both rhumb line and great circle.
3——its directions conform very closely to directions on the earth.
4——all of the above are true.

NOTE: See figure 22 in the appendix for a diagram of this projection.

7. Pressure altitude and indicated altitude are approximately the same at 5,000 feet *above the ground* over Tucson, Arizona. Indicated airspeed is 170 m.p.h. If you use the TUS FD (Winds-Aloft Forecast) given in figure 4 of the appendix, you determine that

1——TAS is approximately 197 m.p.h.
2——TAS is approximately 183 m.p.h.
3——TAS is approximately 190 m.p.h.
4——there is not enough information available to find true airspeed.

NOTE: Assume CAS (Calibrated Airspeed) to be identical to IAS.

8. The statements listed below concerning the 1:00 a.m. EST surface weather map (see fig. 6 of appendix) may or may not be correct.

A. Tropical maritime air is south and east of the fronts while polar maritime air lies NW of the N–S front.
B. The front which extends eastward from Salt Lake City is an occluded front.
C. The front which extends eastward from Salt Lake City is a stationary front.
D. The isobar of lowest pressure that can be identified is the 1004.0-millibar line.
E. The isobaric pattern is such that the surface winds over the area pictured should be moderately strong (25 to 30 knots).
F. The surface wind at Winslow, Arizona, is from the north.
G. The surface temperature is 67° F. and dewpoint is 29° F. at Winslow, Arizona.

In selecting all the correct statements from the preceding, you would include items

1——A, B, E, and G.
2——A, C, D, and G.
3——C, D, and G.
4——B, E, and F.

9. Your weight .....165 lbs.
Front seat passenger weight ..150 lbs.
Rear seat passenger weight ..365 lbs.
Fuel .....Full
Oil .....Full
Baggage .....150 lbs.

Using the above information, together with data from the Aircraft Description in figure

ASSA 45825

8, you are able to determine through use of the Loading Graph and Center of Gravity Envelope Graph (fig. 10 of the appendix) that

1——your gross weight and balance requirements are both within limits.
2——your weight is in excess of maximum gross limit and until it is within limits it would be a waste of time to attempt to evaluate the center of gravity condition.
3——both weight and balance conditions are outside of established limits.
4——it is not possible to determine if the weight and balance conditions are within limit on the basis of information supplied.

10. If you were to drain 21 gallons of fuel from your tanks, you will

1——be within all placarded limitations.
2——still exceed placarded baggage limitations.
3——still exceed gross weight and balance limitations.
4——still be unable to figure your weight and balance problems because there is not enough information.

Your flight is comparatively short with two intermediate stops, so you decide to drain 21 gallons of gas and readjust your load in order to provide for better aircraft performance as well as allow for other important considerations.

11. You plan to remain VFR at all times, and to avoid turbulence as much as possible, you plan to fly more than 3,000 feet above the ground enroute. Your enroute altitude

1——would be indeterminable until you compute the magnetic heading.
2——should be odd thousand plus 500 feet from Gallup, New Mexico, to Holbrook, Arizona.
3——should be odd thousand plus 500 feet.
4——should be even thousand plus 500 feet.

12. Concerning Airport Traffic Area Rules as required by Federal Aviation Regulations, which of the following statements apply?

A. An Airport Traffic Area is defined as the space included within a 5-statute-mile horizontal radius of the geographical center of an airport and extending up to (but not including) 2,000 feet above the surface of the airport at which an operative traffic control tower is located.

B. Aircraft, when operating to or from an airport having a tower operated by the United States, shall normally maintain two-way radio communication with that tower while in the Airport Traffic Area.

C. The basic VFR minimums when operating in an Airport Advisory Service Area are 5 miles visibility and 1,500-foot ceiling.

D. Unless he receives subsequent instructions to the contrary, a pilot who has been authorized by the tower to taxi "TO" a designated runway may cross any runways that intersect or cross his taxi route.

1——A, B, D.
2——A, B, C, D.
3——B, C.
4——A, B, C.

13. Refer to the *Airman's Information Manual* data in figures 14, 15, 16, 17, 18, and 19 of the appendix, and determine which of the following statements are ACCURATE.

A. The Holbrook Municipal Airport, Holbrook, Arizona, has only one runway.

B. The longest runway at Holbrook Municipal Airport is between 4,970 and 5,069 feet in length.

C. A Flight Service Station is located on the Tucson Municipal Airport, Tucson, Arizona.

D. Neither the Holbrook nor the Flagstaff Airport has UNICOM facilities.

E. Both the Holbrook and the Flagstaff Airports have the proper fuel for your airplane.

15826

F. At Prescott, Arizona, Runway 3–21 is closed for takeoff and landing until further notice.

1——A, B, D, E.
2——C, E.
3——B, C, E.
4——B, D, F.

14. Of the airports where you intend to land along your route of flight, only the Winslow Municipal Airport, Winslow, Arizona, is within a control zone. If you were to land here, your basic VFR minimums would

1——be the same as for the other airports where you intend to land.
2——require 5 miles visibility and a ceiling of 1,500 feet.
3——require 3 miles visibility and a ceiling of 1,200 feet.
4——require 3 miles visibility and a ceiling of at least 1,000 feet.

LEG I

15. If you were to select 10,500 feet MSL as your cruising altitude on the first leg of your flight, and at that indicated altitude found your pressure altitude to be 10,000 feet, your approximate compass heading and true airspeed should be

1——230° and 180 m.p.h.
2——229° and 173 m.p.h.
3——251° and 173 m.p.h.
4——251° and 179 m.p.h.

NOTE: Use an indicated airspeed of 150 m.p.h., outside air temperature of 10° C and the Winslow Winds Aloft Forecast (fig. 4). You need not interpolate the winds. (See fig. 9 for compass correction card.)

16. Assuming a gross weight of 2,900 lbs., together with a surface temperature of 73° F. and an estimated surface wind of 13 knots, your approximate takeoff distance to clear a 50-foot obstacle at Gallup, New Mexico, is

1——1,955 feet.
2——1,638 feet.
3——1,817 feet.
4——1,390 feet.

NOTE: Refer to the performance charts (fig. 12 of the appendix).

17. After your takeoff from Gallup, New Mexico, at 0830 MST, you notice as you climb out on course that you are passing through 8,800 feet. Which of the altimeter illustrations in figure 23 of the appendix indicates this altitude?

1——A.
2——B.
3——C.
4——D.

18. Assume that you have 33 gallons of usable fuel remaining after you reach 10,500 feet. Approximately how long can you fly with a power setting of 2200 r.p.m. and 19 inches of manifold pressure if you retain a 30-minute fuel reserve?

1——2 hours and 52 minutes.
2——5 hours and 6 minutes.
3——3 hours and 21 minutes.
4——None of the above are correct.

NOTE: Refer to the 10,000-ft. Cruise Performance Chart in the appendix, figure 13.

*19. While enroute to Holbrook, Arizona, you use ADF to tune in and properly identify the Winslow, Arizona, low frequency navigation aid. The proper setting for the function switch when warming up and tuning the ADF is

1——loop position.
2——antenna (receiver) position.
3——compass position.
4——aural null position.

*20. You are able to read the coded identifier for the Winslow L/MF facility satisfactorily, but repeated trials prove that there are neither "A" nor "N" quadrant signals, nor on-course signals. After a careful check of your equipment, the chart, and the Airport/Facility Directory of the *Airman's Information Manual* (figure 17 of the appendix), you decide

1——the L/MF ground facility is not functioning properly.
2——you have lost your sensing antenna.
3——your function switch was on the aural null position.
4——the Winslow L/MF navigation aid is no longer an L/MF radio range station.

15827

LEG II

21. If you select 10,500 feet as your cruising altitude on the flight from Holbrook, Arizona, to Flagstaff, Arizona, and use an estimated indicated airspeed of 170 m.p.h., an outside air temperature of +15° C. and the Winslow Winds-Aloft Forecast (fig. 4 in the appendix), you compute your estimated average groundspeed for this leg to be approximately

1——187 m.p.h.
2——175 m.p.h.
3——150 m.p.h.
4——None of the above.

NOTE: You need not interpolate winds. Assume pressure altitude and indicated altitude to be the same.

22. Assume that on this leg of the flight, conditions are favorable for carburetor icing. To properly cope with this condition, you should know that

A. in your airplane, the first evidence of carburetor icing would be a decrease in r.p.m., followed by engine roughness.
B. the first indication of carburetor icing is engine roughness, followed by loss of engine r.p.m.
C. in your airplane the first evidence of carburetor icing would most likely be a decrease in manifold pressure.
D. it is best to use carburetor heat as a preventive measure rather than as a measure to cure the icing condition.
E. it is best to wait until there is some evidence of carburetor icing before application of carburetor heat since application of heat when no ice is present will result in a lean mixture and possible detonation.

In selecting correct statements from the above list, you would include items

1——A and D.
2——B and E.
3——C and E.
4——C and D.

23. As you approach the Winslow, Arizona, VORTAC, you note that your course will cause you to cross the path of a four-engine jet. This crossing will be approximately 3 miles behind and slightly below the jet. If you are familiar with hazards involving turbulence in the wake of large aircraft, you would select which of the following as correct statements?

A. The main source of the disturbance or turbulence is the "jet wash" or "prop wash".
B. The main source of the disturbance or turbulence is the vortex created by the wing tips.
C. Large, heavy, slow flying aircraft produce the most violent turbulence or vortices.
D. The violent, compact, tornado-like air masses associated with this phenomena can cause loss of aircraft control or even structural failure.
E. Under the circumstances described, you are too far from the jet to be affected by this invisible hazard.
F. If you encounter this hazard in cruising flight, you should decrease speed as fast as possible, avoid "fighting the controls", and if possible change altitude.
G. If taking off or landing behind large aircraft, fly up-wind of their track, KEEP PLENTY OF DISTANCE, and request delay from the tower on takeoffs and landings if in doubt about wake turbulence or spacing.
H. Helicopters can create conditions of vortex turbulence similar to that produced by fixed-wing aircraft and you should stay above their flight path.

1——B, C, D, F, G, and H.
2——A, D, E, F, and G.
3——A, C, D, E, and G.
4——B, E, F, and H.

24. If, for some reason, you were to lose your visual references while taking evasive action with regard to the jet, and a check of your instruments showed the readings pictured in figure 25 in the appendix, which of the following statements are true? You are in a

A. coordinated, descending turn to the right, and should first reduce power and bank to return to level flight.

15828

B. coordinated, descending turn to the right, and should first add power and increase back pressure to return to level flight.

C. skidding, climbing turn to the left.

D. nose-high attitude.

E. nose-low attitude.

F. 20° bank, approximately.

G. standard rate turn.

1——A, D, F, and G.

2——B, E, F, and G.

3——A, E, F, and G.

4——C and D only.

25. Assume that you now find yourself in a coordinated level turn with a 40° bank. Your present gross weight, when in straight and level flight, is 2,800 pounds. Referring to the illustrations in figure 26 in the appendix, which of the following statements are correct?

A. In the situation depicted in illustration A, your approximate effective gross weight is 3,668 pounds.

B. Your rate of turn is the same for situation A, B, and C, but the radius of turn increases as the speed increases.

C. The radius of turn remains constant for situations A, B, and C, but the rate of turn will increase as the speed increases.

D. The radius of turn is less, but the rate of turn is greater in situation A than in either B or C.

E. The load factor increases as the speed increases.

1——B and C.

2——A, C, and D.

3——A, B, and D.

4——A and D.

26. Soon after leveling off on-course, you encounter moderate turbulence and quickly you check your airspeed indicator which appears in figure 27 of the appendix. If you wished to remain at or below maximum structural cruising speed, you could not exceed

1——252 m.p.h.

2——10 m.p.h. less than red line speed.

3——210 m.p.h.

4——None of the above are correct.

*27. In the vicinity of Winslow, Arizona, you decide to combine ADF navigation and pilotage. You tune in and identify the Winslow low frequency radio aid to navigation. You next place the ADF function switch on COMP. After the ADF needle holds a steady indication, you check your magnetic heading and the ADF readings. Their indications are shown in figure 28 in the appendix. This means you have a

1——magnetic bearing of 45° to the station and that you are southwest of the station.

2——relative bearing of 45°, but your bearing to the station cannot be determined with the information supplied.

3——magnetic bearing of 315° to the station, and that you are southeast of the station.

4——magnetic bearing of 45° to the station and that you are southeast of the station.

NOTE: Assume a nonrotatable azimuth dial on the ADF.

28. You are ready to land on Runway 21 at Flagstaff, Arizona, Municipal Airport, after a total flying time of 1 hour and 5 minutes since leaving Gallup, New Mexico. Fuel consumption has been at the rate of 10 gallons per hour. Surface wind is 20 knots from 210°, and surface temperature is 75° F. You will use 40° of flaps for the landing. Referring to the landing table in figure 12 of the appendix, your landing distance for clearing a 50-foot obstacle is approximately

1——834 feet if the temperature were standard at your altitude.

2——973 feet regardless of the temperature.

3——1,390 feet.

4——645 feet.

NOTE: Interpolate weight to the closest 500 pounds, altitude to the closest 500 feet, and wind to the closest 6 m.p.h. Assume takeoff gross weight was 2,900 pounds.

LEG III

29. It is 1700 MST before your clients are ready to take off for Williams, Arizona. A check of the *latest* area forecast, terminal forecast, and in-flight weather advisories in

13829

figures 3, and 4, of the appendix indicates that there should be

1——only scattered clouds at 8,000 feet above the ground, and turbulence should remain about the same as the evening progresses.

2——increasing turbulence and decreasing clouds as the evening progresses.

3——no ceilings below 10,000 feet MSL, and turbulence should gradually decrease.

4——scattered clouds at 8,000 feet, broken clouds 12,000 — 15,000 above ground, and gradually decreasing turbulence.

30. After departing Flagstaff, Arizona, you wish to "dog-leg" your direct route so as to stay away from the Restricted Area (R–2302), 7 miles west of Flagstaff, and yet stay close to the highway and railroad to Williams. You tune in and identify the Winslow VORTAC with the omni bearing selector set on 270°. If you did not know your position and used *only* your omni, which reads as illustrated in figure 29 in the appendix, you would know that you are

1——on the 90° radial and flying toward the station.

2——on the 270° radial and flying away from the station.

3——unable to determine at the moment where you are going, but you are on the 270° radial.

4——unable to determine *anything* about where you are, or where you are going.

31. Assume that in taxiing to the flight line at the Williams Municipal Airport, Williams, Arizona, your nosewheel collapses causing damage in excess of $300.00. If you were unsure about accident reporting procedures, you could find the necessary information in

1——Part 61, Federal Aviation Regulations.

2——Part 67, Federal Aviation Regulations.

3——Part 1, Federal Aviation Regulations.

4——Civil Aeronautics Board, Safety Investigation Regulations Part 320.

32. Usually the first measure appropriate for control of detonation on takeoff in an aircraft with constant speed propellers is the

1——reduction of manifold pressure.

2——reduction of r.p.m.

3——adjustment of mixture to a leaner setting.

4——application of carburetor heat.

* Indicates questions that are applicable primarily to the Ground Instructor—Advanced Examination.

15830

ANSWERS AND EXPLANATIONS

Section 1 — Fundamentals of Instructing

1. (1) Alternate #2 is incorrect because it refers only to one of the factors which affect reliability, not the complete evaluation of reliability. Alternate #3 has nothing to do with reliability of a test. Alternate #4 is the definition for validity.

2. (3) Alternates #1 and #2 are not complete. Alternate #4, while useful, is not as essential to success in teaching as item #3.

3. (3) All of the other responses are means of effecting improvement, not clues to determining the need for improvement.

4. (1) The statements made in this question cover a broad range of items; however, the correct response may be found in *Flight Instructor's Handbook*, AC 61–16. Response #2 is incorrect because every item included in it is incorrect. Response #3 is incorrect because items D, E, and L are incorrect. Response #4 is incorrect because it includes item G.

5. (4) All other responses will test for rote memory on ability to deal with familiar problems which, in themselves, will not effectively prove that the student *understands* what he knows.

Section 2 — Aeronautical Knowledge

1. (2) FAR 91.5, *Preflight Action*, states: "Each pilot in command shall, before beginning a flight, familiarize himself with all available information concerning that flight. This information must include, for a flight under IFR or a flight not in the vicinity of an airport, available weather reports and forecasts, fuel requirements, alternatives available if the planned flight cannot be completed, and any known traffic delays of which he has been advised by ATC."

2. (4) The 0700 Sequence Report for GNT shows the letter "Ø Ø Ø Ø" in the space denoting surface wind which designates a calm wind condition.

3. (4) The reported layer of *thin* broken clouds at 12,000 feet does not constitute a ceiling. (Reference *Aviation Weather* AC 00–6, and Part 1 of the Federal Aviation Regulations.)

4. (4) The study of hourly sequence reports *only* will not furnish sufficient information to make a route forecast of your own. (Reference *Aviation Weather* AC 00-6.)

5. (2) The terminal forecasts call for surface winds in this area to be 20 to 30 knots. The in-flight advisory calls for light to moderate turbulence below 14,000 feet until at least 1900M. Area forecasts covering the period between 0600 MST and 1800 MST call for light to moderate turbulence with locally severe turbulence in some areas. The 1245Z Pilot Report Summary supports the Terminal and Area Forecasts and In-Flight Advisory.

6. (4) The first three statements are all true. (Reference p. 16–28, *Practical Air Navigation*, 9th edition.)

7. (1) Using a pressure altitude of 7,630 (5,000 feet plus ground elevation at TUS), and a forecast temperature of +20° C., (you must interpolate the temperature between 5,000 feet and 10,000 feet) your computer should indicate approximately 197 m.p.h. TAS opposite a CAS of 170 m.p.h. Normally the indicated airspeed should be corrected for instrument and installation errors to calibrated airspeed. This can be done through the use of an airspeed correction table as shown in figure 33. Remember, calibrated airspeed (CAS) is the same as true indicated airspeed (TIAS).

15831

8. (2) The air mass to the south and east of the front is composed of tropical maritime air as represented by the symbol "MT" located in the Texas Panhandle. The air mass to the northwest of the front is composed of maritime polar air as represented by the symbol "MP" located in Northern California. (Reference *Aviation Weather* AC 00-6.) The portion of the front extending eastward from Salt Lake City is stationary as indicated by a combination of the warm front and cold front symbols and their placement (opposing) on the frontal line. (Reference *Aviation Weather* AC 00–6.)

Isobars are lines connecting points of equal pressure. The line curving into Nevada from Cedar, Utah, and back to the front at a point north of Salt Lake City, Utah, represents a pressure of 1004.0 millibars as indicated by the figure "1004." (Reference *Aviation Weather* AC 00–6.)

The figure "67" at the 10 o'clock position and the figure "29" at the 8 o'clock position on the Winslow station model represent a temperature of 67° F. and a dewpoint of 29° F. respectively. (See the specimen station model in fig. 6.)

9. (2) The empty weight, including unusable fuel, is 1839 lbs. (figs. 8 and 11). The empty weight moment is approximately 65,900 pound-inches (empty weight X empty C.G.).

LOADING PROBLEM

	Weight in Pounds	*Moment in Thousand Pound-Inches*
Airplane (empty)	1839	65.9
Pilot and Front Seat Passenger	315	11.5
Rear Seat Passengers ..	365	25.4
Fuel (55 gal. @ 6 lbs. per gal., fig. 9)	330	15.8
Oil (3 gal. @ 7.5 lbs. per gal., fig. 11)	22.5	−.4
Baggage	150	14.1*
TOTAL	3021.5	132.3

*Extrapolated From Loading Graph, Figure 10.

In this particular instance it is not possible to state with absolute certainty that the airplane is not within safe balance limits even though it exceeds weight limits. The moment of 132.3 does lie within the extended lines on the chart which delineate the forward and rearward C.G. limits. In reality, the question becomes rather academic since you could not legally take off with a gross weight of 3021.5 pounds, regardless of the situation with regard to C.G. Your gross weight is 121.5 pounds in excess of the maximum allowable gross weight; therefore, you must reduce the load to 2900 pounds or less and recompute the center of gravity. (Reference figures 10 and 11, and *Flight Training Handbook*, AC 1–21.)

10. (2) The draining of 21 gallons (126 lbs.) of fuel would reduce the gross weight below the maximum allowable, but the baggage weight still would exceed maximum allowable weight of 125 pounds in the baggage compartment. (Reference fig. 8.)

11. (4) When an aircraft is operated in level cruising flight at 3,000 feet or more above the surface, the cruising altitudes . . . shall be observed:

(a) "Below 18,000 feet. At an altitude appropriate to the magnetic course being flown as follows:
  (1) ". . ."
  (2) "180° to 359° inclusive, at even thousands plus 500 (4,500; 6,500; etc.)." (Reference FAR 91.109.)

12. (1) Statements A, B, and D are correct. (Reference FAR 1, *Definitions*, for Statement A; FAR 91.87, *Operation at Airports with Operating Control Towers*, for Statements B and D.

13. (3) Statements B, C, and E are accurate and may be verified by referring to figures 14, 15, 16, 17, and 18 in the appendix. A careful analysis of figures 14, 15, 16, 17, 18, and 19 will reveal that statements A, D, and F are erroneous.

14. (4) Regulations pertaining to *basic* VFR minimums state that an aircraft shall not be flown within a control zone beneath the ceiling if the ceiling is less than 1,000 feet. Neither shall any person operate an aircraft in flight within a control zone when the flight visibility is less than 3 miles. When ground visibility is less than 3 miles no person shall take off or land an aircraft, or enter

15832

the traffic pattern of an airport within a control zone. Study FAR 91.105.

15. (1) Given Indicated Airspeed
——150 m.p.h.
Given Pressure Altitude
——10,000 Feet
Given Outside Air Temperature
—— +10° C.
Computed True Airspeed
——180 m.p.h.
Plotted True Course
——243°
Figure 4—Wind
——230°/29 m.p.h. (25 knots)
Computed Wind Correction Angle
—— −2°
Computed True Heading
——241°
Chart Magnetic Variation
——14° E.
Computed Magnetic Heading
——227°
Figure 9 (intermediate) compass deviation
—— +3°
Computed Compass Heading
——230°

16. (2) The elevation of McKinley County Airport at Gallup, New Mexico, is 6,467 feet. Referring to the takeoff data chart in figure 12, you will note that interpolation between the 5,000-foot and 7,500-foot column will be necessary. Enter the chart at the 2900 lb. gross weight block and read across (right) on the 15 m.p.h. (13 knots) line to:

5,000 ft.—1,200′ to clear 50′ obstacle
7,500 ft.—1,580′ to clear 50′ obstacle
Difference—380′
Interpolate for 6,467 feet—59% of 380′ plus 1,200 feet (in actual practice 60% would probably be more desirable)
6,467 feet—1,424′ to clear 50′ obstacle (*with standard temperature*)
Interpolated standard temperature for 6,467 feet is +36° F. Current temperature of +73° F. will necessitate increasing the takeoff distance by 15% (current temperature is 37° higher than standard).

Final Computed Takeoff Distance at Gallup is *1,638* feet.

17. (2) The altitudes indicated by the four altimeters are as follows:

A. 880 feet.
B. 8,800 feet.
C. 18,800 feet.
D. 7,880 feet.

18. (1) Figure 13 in the appendix shows a fuel consumption of 9.8 gal./hr. at 10,000 feet with a power setting of 2200 r.p.m. and 19 inches of manifold pressure. Subtracting the 30-minute fuel reserve from the total of 33 gallons leaves 28.1 gallons of fuel (33 gallons—4.9 gallons). Burning 28.1 gallons of fuel at the rate of 9.8 gallons per hour would permit 2 hours 52 minutes of flying. Study the charts until you understand their use.

19. (2) When tuning a radio compass, the set should be allowed to warm up with the switch in the "Ant" or "Rcvr" position.

20. (4) A careful check of the excerpt from the *Airman's Information Manual,* figure 17, shows that the Winslow low frequency facility is now classified as RBN H-SAB. From the information in figure 17, we find that this means it is a non-directional radio beacon providing automatic transcribed weather service (TWEB). The WAC Chart is not current in the information it provides with regard to this radio navigation aid. This illustrates one of the reasons why some of the information which appears on charts must be cross-checked against appropriate supplemental sources of information. *Use* the *Airman's Information Manual* in planning and conducting flights. Study chapter 4 of *Practical Air Navigation.* Note in particular the last paragraph on page 58.

21. (1) You must first correct indicated airspeed to true airspeed. An indicated airspeed of 170 m.p.h. at 10,500 feet and +15° C. results in a true airspeed of 207 m.p.h. To compute the average groundspeed you could either use an average true course and apply the wind to this or apply the wind to each segment of the leg and average the resulting groundspeeds. It should be noted that technically this procedure is not abso-

5. Transmissions	5. Teaching Machine cards 17C, 18A, 18B, 18C	5. Teaching Machine (Shop)

lutely accurate since it is 10 miles more from the INW to Flagstaff than from Holbrook Airport to INW VORTAC. However, the difference in groundspeeds over the two segments is negligible; therefore, the time difference would be slight. The INW winds aloft forecast shows the wind at 10,000 feet is from 230° true, at approximately 29 m.p.h. Whether you apply this wind to an average true course of 279° or to the exact true course for each segment and average the resulting groundspeeds, the answer is the same—187 m.p.h.

22. (4) In aircraft with constant speed propellers, loss of power is first reflected in the manifold pressure reading since the propeller governor will maintain the r.p.m. setting made with the propeller control. Engine roughness generally does not develop to a noticeable degree until icing has progressed beyond the point where it could have been recognized by loss of manifold pressure. It is far easier and safer to prevent the formation of carburetor ice than to remove it after it has formed. Study chapter 18 of *Private Pilot's Handbook of Aeronautical Knowledge.*

23. (1) This problem is covered in detail in Exam-O-Gram No. 3 and Advisory Circular 90–23, *Wake Turbulence* (information available at General Aviation District Offices or through the FAA, Washington, D. C. 20590). You should study both of these publications carefully.

24. (3) The quality of a turn (slipping, skidding, coordinated) is indicated by the position of the ball in the turn-and-bank indicator. If the ball is in the center between the two reference markers, the turn is coordinated. The aircraft is in a nose-low attitude since the attitude indicator (artificial horizon) shows the nose below the horizon and the other instruments show a descent. Even if the attitude indicator were malfunctioning, it is scarcely possible to be in other than a nose-low attitude in your airplane with the airspeed, vertical speed, and altimeter indicating as illustrated. The attitude indicator shows a 20° bank to the right (each of the small graduations on the scale at the top of the instrument is for 10°). The turn needle also indicates a turn to the right at a standard rate. Reduce power, decrease bank, and then apply back pressure as necessary to recover when the nose is low and the airspeed is increasing. This is much safer than adding back pressure first which might well increase the load factor beyond safe limits.

25. (4) The load factor for a 40° bank is determined by using the graph in figure 26. This graph gives a load factor of approximately 1.31 for a 40° bank. Multiplying 2800 by 1.31 results in an effective gross weight of 3,668 lbs. In order to maintain a given rate of turn, the angle of bank must be varied with the TAS. If, for example, you wish to hold a standard rate turn of 3° per second at a true airspeed of 100 m.p.h., your angle of bank will be 13.5°. The bank required to produce this same rate of turn at 200 m.p.h. TAS is nearly double the bank required at 100 m.p.h. It now becomes 25.6°; therefore, the rate of turn must decrease if the TAS increases while the bank remains constant. It then follows that any given bank at slow speed provides a higher rate of turn and results in a smaller radius of turn than the same degree of bank at higher speeds.

26. (3) Maximum structural speed (V_{no}) is the maximum speed for normal operation. It is located at the juncture point of the lower limit of the yellow arc (caution), and the upper limit of the green arc (normal operating range) on the face of the airspeed indicator. Study Exam-O-Gram No. 8 and FAR 23.1545.

27. (3) The magnetic bearing to the station is the magnetic heading ± the relative bearing. 270°, the magnetic heading, plus 45°, the relative bearing, is 315°, the magnetic bearing *to* the station. If the magnetic bearing to the station is 315°, then the magnetic bearing *from* the station is the reciprocal of this, or 135°. A magnetic bearing of 135° from the station places you southeast of the station. Because of meridian convergence and possible difference in variation values between the location of the station and the location of the aircraft, certain errors are inherent to the use of radio bearings. Therefore, the serious student should study carefully chapters 11 and 14 of *Practical Air Navigation* (9th Edition).

15834

28. (1) Flying for 1 hour 5 minutes burning fuel at the rate of 10 gallons per hour would mean a gross weight reduction of approximately 65 pounds. Interpolating weight to the closest 500 pounds would mean using a weight of 2,900 pounds for the following computation:

(a) A 20-knot headwind equals 23 m.p.h.

(b) 24 m.p.h. means a 40% reduction in landing distance.

(c) Field elevation of Flagstaff is 7,012 feet; thus the closest 1,000-ft value is 7,000 feet.

(d) Interpolating on the chart, with a gross weight of 2,900 lbs. at 7,000 feet and standard temperature, the landing distance to clear a 50′ obstacle is *1,390* feet.

(e) A 40% reduction of 1,390 feet is 556 feet.

(f) Subtracting 556 feet from 1,390 feet equals 834 feet.

(g) This figure is valid only if the temperature is standard at 7,000 feet.

29. (3) The latest weather information in figures 3 and 4, pertaining to those items mentioned in the question are:

*FA 1845Z
*FT 2245Z
*FL 2320Z

Area forecasts report heights of cloud bases above mean sea level, not the ground, unless stated to the contrary. Cloud bases on terminal forecasts are reported in feet above the ground. A check of the terminal and area forecasts reveals that in both instances clouds are forecast to be above 10,000 feet MSL. The 2320Z AIRMET indicates that the moderately turbulent conditions existing below 14,000 feet in northern New Mexico and Arizona should decrease to light turbulence by 1900 MST. Study Chapter 17, *Aviation Weather*.

30. (3) With the information supplied, you cannot fix your location by use of omni alone, but under the circumstances given here you can only determine that you are on the 270° radial. At any given moment, omni alone tells you only where you are and *not* where you are going. Only by relating the course selector value and the TO-FROM indication to the magnetic compass reading can you determine whether you are actually going TO the station or FROM the station on the selected radial or simply crossing that radial. Even after you have determined which radial you are on you can determine your position or "fix" along this radial only by use of geographical landmarks, or an accurate groundspeed estimate, or by a cross-bearing from another station. For a more detailed explanation of omni (VOR) and its use, study chapter 28 of the 1965 edition of the *Private Pilot's Handbook of Aeronautical Knowledge*, chapter 13 of the 9th edition of *Practical Air Navigation*, and Exam-O-Grams 15 and 16.

31. (4) Figure 21 gives an explanation of how to report an accident and refers to the Regulation which pertains to this requirement.

32. (1) Horsepower is a function of both torque and r.p.m. That is, an engine can deliver the same brake horsepower (b.h.p.) at different combinations of crankshaft r.p.m. and crankshaft torque. The pilot, through adjustment of throttle and r.p.m., exercises control over these factors. One of the basic limitations placed on engine operation is the amount of pressure developed within a cylinder as controlled by combination of torque and r.p.m. values. An increase in these values will increase pressure and pressure will increase power. It will also increase the loads imposed on the engine, and if they are not controlled or kept within limits, it can ultimately result in engine failure. Power is therefore limited by the pressures developed within the cylinders. The most convenient way of estimating cylinder pressure is through the index of Brake Mean Effective Pressure (BMEP).

The limits of operation within which the accepted degree of reliability can be obtained are known as engine ratings. Takeoff power

* See figure 2 for meaning of code.

15836
15835

generally approaches the limits of these ratings for an engine. If detonation should occur on takeoff, the throttle should be retarded in order to reduce the cylinder pressure. If the RPM is reduced *first* it will cause an *increase* in BMEP, and only aggravate the condition. Adjustments of mixture may produce just the opposite of results desired if the cause of the detonation is improperly evaluated. Application of carburetor heat with full power setting will tend to cause or increase detonation.

/ PERFORMANCE OBJECTIVE STATEMENT /

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: II. TRANSMISSIONS - STANDARD, MANUAL SHIFT

PERFORMANCE OBJECTIVE NO.: 2 TITLE: Disassemble, Check, and Reassemble Standard Transmission

CONDITIONS:

This assignment will be performed on a transmission obtained from the parts storage room. Under performance checks and tests, perform only bench checks and tests on this unit.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Obtain a transmission from the parts storage room
2. Select proper manual and turn to appropiate chapter
3. Select proper tools and materials
4. Disassemble the transmission following all steps as outlined in the manual
5. Identify all parts and their function
6. Perform all tests and checks as outlined in the manual
7. Reassemble transmission following all steps as outlined in the manual
8. Perform all bench tests and checks as outlined in manual
9. If all tests and checks are satisfactory, return transmission to storage area
10. Return tools and materials to proper place
11. Clean area for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily disassemble, check, and reassemble 3 speed manual shift transmission in 3 hours

Learning time: 4 hours

1580

AIRCRAFT DESCRIPTION
PLACARDS IN THE AIRPLANE

THIS AIRPLANE MUST BE OPERATED AS A NORMAL CATEGORY AIRPLANE. NO ACROBATIC MANEUVERS (INCLUDING SPINS) APPROVED

IDENTIFICATION: N 2468W.

MAXIMUM GEAR OPERATING SPEED: 135 mph, CAS.

MANEUVERING SPEED: 130 mph, CAS.

MAXIMUM ALLOWABLE WEIGHT IN BAGGAGE COMPARTMENT: 125 lbs.

The following information is excerpted from the AIRPLANE FLIGHT MANUAL.

ENGINE OPERATION LIMITATION: Power and Speed 260 bhp at 2625 rpm.

FUEL SYSTEM: The engine is approved for 100/130 fuel only. Fuel is supplied from 2 tanks of 32.5 gallons total capacity each.

Separate electric gauges indicate the quantity in each tank. The gauges read empty when the level is down to 5 gallons since the last 5 gallons in each tank are unusable. The airplane is equipped with an electrically-driven auxiliary fuel pump for standby use in the event the engine-driven pump fails.

OIL: The engine uses a wet-sump, full-pressure oil system. The oil capacity is 12 quarts.

For temperature above 40° F use SAE 50; below 40° F use SAE 30.

PROPELLER: The propeller is a single-acting, hydraulic constant-speed type with two forged aluminum blades, controlled by an engine-driven governor.

HYDRAULIC SYSTEM: The landing gear and flaps are extended and retracted by hydraulic actuators, powered by an engine-driven hydraulic pump and a pressure accumulator.

ENGINE INSTRUMENT MARKINGS:

Oil Pressure Gauge	
Idling	10 psi (red line)
Normal Operating Range	30–60 psi (green arc)
Maximum Pressure	100 psi (red line)
Manifold Pressure Gauge	
Normal Operating Range	15–24 in. Hg (green arc)
Cylinder Head Temperature	
Normal Operating Range	300–460° F (green arc)
Do Not Exceed	460° F (red line)
Tachometer	
Normal Operating Range	2200–2450 rpm (green arc)
Maximum (Engine-rated speed)	2625 rpm (red line)
Fuel Quantity Indicators	
Less than one-quarter tank remaining	red arc to red line
Empty (includes 5 gallons each tank unusable)	E (red line)

EMPTY WEIGHT: 1839 lbs.

MAXIMUM GROSS WEIGHT: 2900 lbs.

FLIGHT LOAD FACTORS:

Flaps Up	+3.8, − 1.52
Flaps Down	+3.5

EMERGENCY PROCEDURES:

Emergency Gear Extension Procedure.

When the landing gear will not extend hydraulically, it may be extended manually as follows:

(1) Place the gear handle in the full down position.

(2) Pull the auxiliary pump handle out its full extension.

(3) Operate the auxiliary pump handle up and down until the green gear-down light comes on.

FIGURE 9. *Radio equipment and compass correction card.*

FIGURE 10. *Loading graph and center of gravity envelope.*

15845

WEIGHT AND BALANCE

All airplanes are designed for certain limit loads and balance conditions. These limits for your aircraft are shown on the graphs for Figure 10.

An individual weight and balance report and equipment list is furnished with each airplane; these documents list the empty weight and empty weight center of gravity of the individual airplane as equipped when it left the factory. *Changes in equipment which affect the empty weight and empty weight center of gravity must be entered in the aircraft maintenance records in accordance with Federal Aviation Regulations.*

To determine that your gross weight and center of gravity for a given flight are within limits, use the following procedure:

(1) From the weight and balance report or the latest entry pertaining to weight and balance in the aircraft maintenance record.

(2) Determine the weights and moments of your disposable load items, using the loading graph.

(3) Add these items, as shown in the sample problem.

(4) Plot the totals on the center of gravity envelope graph.

EXAMPLE PROBLEM

Example for an airplane with a licensed empty weight of 1839 pounds and a moment of 65,873 pound-inches: (Empty weight of 1,839 lbs. multiplied by the number of inches the empty C. G. is from the datum—in this airplane 35.82 inches. The figure thus obtained is arbitrarily divided by 1,000, the moment in pound inches.)

	Weight Pounds	*Moment (lb-in) 1000*
Empty Weight (licensed)	1839.0	65.9
Oil (12 qts.)	22.5	−0.4
Pilot and Front Seat Passenger	340.0	12.2
Rear Seat Passengers	340.0	23.8
Full Fuel (55 gal.)	330.0	15.8
Baggage	28.5	2.7
TOTAL	2900.0	120.0

Locate this point (2900 – 120.0) on the center of gravity envelope graph. Since the point falls within the envelope the above loading meets all the balance requirements.

FIGURE 11. *Weight and balance instructions.*

15848

AIRPORT FACILITY DIRECTORY LEGEND

LOCATION

The airport location is given in nautical miles (to the nearest mile) and direction from center of referenced city.

ELEVATION

Elevation is given in feet above mean sea level and is based on highest usable portion of the landing area. When elevation is sea level, elevation will be indicated as "00". When elevation is below sea level, a minus sign (–) will precede the figure.

RUNWAYS

The runway surface, length, reciprocal headings, and weight bearing capacity are listed for the longest instrument runway or sealane, or the longest active landing portion of the runway or strip, given to the nearest hundred feet, using 70 feet as the division point, i.e., 1468 feet would be shown as "14"; 1474 feet would be shown as "15." Runway lengths prefixed by the letter "H" indicates that runways are hard surfaced (concrete; asphalt; bitumen, or macadam with a seal coat). If the runway length is not prefixed, the surface is sod, clay, etc. The total number of runways available is shown in parenthesis. (However, only hard surfaced runways are counted at airfields with both hard surfaced and sod runways.)

RUNWAY WEIGHT BEARING CAPACITY

Add 000 to figure following S, T, TT and MAX for gross weight capacity, e.g., (S–000).

S–Runway weight bearing capacity for aircraft with single-wheel type landing gear. (DC–3), etc.

T–Runway weight bearing capacity for aircraft with twin-wheel type landing gear. (DC–6), etc.

TT–Runway weight bearing capacity for aircraft with twin-tandem type landing gear. (707), etc.

Quadricycle and twin-tandem are considered virtually equal for runway weight bearing considerations, as are single-tandem and twin-wheel.

A blank space following the letter designation is used to indicate the runway weight bearing capacity to sustain aircraft with the same type landing gear, although definite figures are not available, e.g., (T–).

MAX–Maximum runway gross weight bearing capacity for all aircraft.

Omission of weight bearing capacity indicates information unknown. Footnote remarks are used to indicate a runway with a weight bearing greater than the longest runway.

SEAPLANE BASE FACILITIES

A number preceding the parenthetical designation, indicates the number (quantity) available.

Beaching gear, consisting of the quantity and type of beaching gear available.

The number (quantity) if available, of Mooring Buoys (MB) and Crash Boats (CB) available. MB & CB indicates details of quantity are not available.

LIGHTING

B: Rotating Light (Rotating beacon). Green and white, split-beam and other types.) Omission of **B** indicates rotating light is either not available or not operating standard hours (sunset-sunrise).

NOTE.–Code lights are not codified, and are carried in Remarks.

L: Field Lighting (when code **L4–7** is indicated, lighting **4, 5, 6, 7** is available). An asterisk (*) preceding an element indicates that it operates on prior request only (by phone call, telegram or letter). Where the asterisk is not shown, the lights are in operation or available sunset to sunrise or be request (circling the field or radio call). **L** by itself indicates temporary lighting, such as flares, smudge pots, lanterns.

1–Strip lights or portable runway lights (electrical)
2–Boundry
3–Runway Floods
4–Low Intensity Runway
5–Medium Intensity Runway
6–High Intensity Runway
7–Instrument Approach (neon)
8A, B, or C–High Intensity Instrument Approach

9–Sequence Flashing Lights (3,000' out unless otherwise stated)
10–Visual Approach Slope Indicator (VASI)
11–Runway end identification lights (threshold strobe) (REIL)
12–Short approach light systems (SALS)

FIGURE 14. *Airport Facility Directory Legend.*

15849

AIRPORT FACILITY DIRECTORY

Lighting (Con't)

13–Runway alignment lights (RAIL)
14–Runway centerline
15–Touchdown zone

Because the obstructions on virtually all lighted fields are lighted, obstruction lights have not been included in the codification.

SERVICING

S1: Storage.
S2: Storage, minor airframe repairs.
S3: Storage, minor airframe and minor powerplant repairs.
S4: Storage, major airframe and minor powerplant repairs.
S5: Storage, major airframe and major powerplant repairs.

FUEL

F1 80 oct., at least.
F2 80/87 oct., or lower
F3 91/96 oct., or lower
F4 100/130 performance rating, or lower.
F5 115/145 performance rating, or lower.

TURBINE FUELS

TP–1 650 turbine fuels for civil jets.
JP–1 (Kerosene), JP–3, JP–4, JP–5.

DAYLIGHT SAVING TIME

An airport located in a geographic area which normally converts to daylight saving time will be so identified by use of a code.

The two most common time periods during which daylight time is in effect in the conterminous United States are April 25–September 26 and April 25–October 31, and these are indicated as DT 1 and DT 2 respectively. The code "DT" by itself indicates that daylight time is in effect but not on the common time periods of DT 1 or DT 2. In such cases the applicable time period is footnoted in the airport remarks section.

Reference to daylight time will remain in the Airport Directory continuously.

OTHER

AOE–Airport of Entry.
VASI–Visual Approach Slope Indicator, applicable runway provided.
RVV–Runway visibility, applicable runway provided.
RVR–Runway Visual Range, applicable runway provided.
TPA–Traffic Pattern Altitude–This information is provided only at those airports without a 24–hour operating control tower or without an FSS providing Airport Advisory Service. Directions of turns are indicated only when turns of the pattern(s) are to the right (non-standard). TPA data are related to the runway listed under the tabulated airport information. Generally, only one altitude is listed; however, at some airports two altitudes have been established; one for conventional aircraft and one for high performance aircraft. They are shown in this manner, TPA 8/15–R (increments of 100 feet). The higher figure being the higher performance aircraft altitude.
FSS–The name of the controlling FSS is shown in all instances. When the FSS is located on the named airport, "on fld" is shown following the FSS name. When the FSS can be called through the local telephone exchange, (Foreign Exchange) at the cost of a local call, it is indicated by "(LC)" (local call) with the phone number immediately following the name of the FSS, i.e., "FSS: WICHITA (LC481-5867)." When at Intephone line exists between the field and the FSS, it is indicated by "(DL)" (direct line) immediately following the name of the FSS, i.e., "FSS: OTTO (DL)".

AIRPORT REMARKS

"FEE" indicates landing charges for private or nonrevenue producing aircraft. In addition, fees may be charged for planes that remain over a couple of hours and buy no services, or at major airline terminals for all aircraft.

"Rgt tfc 13–31" indicates right turns should be made on landings and takeoffs on runways 13 and 31.

Limited–intended for private use, but use by public is not prohibited.

Remarks data is confined to operational items affecting the status and usability of the airport, traffic patterns and departure procedures.

Obstructions.–Because of space limitations only the more dangerous obstructions are indicated. Natural obstructions, such as trees, clearly discernible for contact operations, are frequently omitted. On the other hand, all pole lines within at least 15:1 glide angle are indicated.

COMMUNICATIONS

Clearance is required prior to taxiing on a runway, taking off, or landing at a tower controlled airport.

When operating at an airport where the control tower is operated by the U.S. Government, two-way radio communication is required unless otherwise authorized by the tower. (When the tower is operated by someone other than the U.S. Government, two-way radio communication is required if the aircraft has the necessary equipment.)

Frequencies transmit and receive unless specified as: T–Transmit only, R–Receive only, X–On request. Primary frequencies are listed first in each frequency grouping, i.e., VHF, LF. Emergency frequency 121.5 is available at all TOWER, APPROACH CONTROL and RADAR facilities, unless indicated otherwise by a crossout: ~~121.5~~

Radar available is listed under "RADAR SERVICES" Radar beacons are indicated by "(BCN)" after "RADAR SERVICES", when available.

VOICE CALL

The voice call for contact with the traffic control services listed at each airport is the airport name followed by the call of the particular service desired, i.e., "LAGUARDIA TOWER." In these instances, only the name of the service is listed. When the voice call of the facility is not the same as the airport name, the complete voice call is listed.

FIGURE 15. *Airport Facility Directory Legend.*

15850

AIRPORT FACILITY DIRECTORY

SERVICES AVAILABLE

(See ATC Operations and Procedures, Section II)

TOWER

Clearance Delivery (CLRNC DEL).
Approach Control (APP CON) Radar and Non-Radar.
Departure Control (DEP CON) Radar and Non-Radar.
VFR Advisory Service (VFR ADV) Non-Radar.
Traffic Information Service (TFC INFO) Radar.
Surveillance Radar Approach (ASR).
Precision Radar Approach (PAR).
Ground Control (GND CON).
VHF Direction Finding (VHF/DF).

RADAR APPROACH PROCEDURE MINIMA

Weather minima for precision and surveillance radar approaches (PAR/ASR) specify only the lowest straight-in authorized for the approach.

FLIGHT SERVICE STATION (FSS)

Airport Advisory Service (AAS).
Island, Mountain and Lake Reporting Service.

UNICOM

Private aeronautical station, operates same hours as the airport, transmits and receives on one of the following frequencies:
U-1-122.8 mc (at airports without a control tower).
U-2-123.0 mc (at airports with a control tower).

12820

RADIO CLASS DESIGNATIONS

Identification of VOR/VORTAC/TACAN Stations by Class (Operational Limitations):

Class	Normally Anticipated Altitude Service	Normally Anticipated Interference Free Distance Service
H	Up to 45,000 MSL	149.75 smi (130 nmi)
	Above 45,000′ MSL	115.2 smi (100 nmi)
L	Up to 18,000′ MSL	46.06 smi (40 nmi)
T	Up to 12,000′ MSL	28.79 smi (25 nmi)

H=High L=Low T=Terminal

NOTE: An H facility is capable of providing L and T service volume and an L facility additionally provides T service volume.

The term VOR is, operationally, a general term covering the VHF omnidirectional bearing type of facility without regard to the fact that the power, the frequency-protected service volume, the equipment configuration, and operational requirements may vary between facilities at different locations.

AB ..... Continuous automatic transcribed broadcast service.

B ..... Scheduled Broadcast Station (broadcasts weather at 15 and 45 minutes after the hour; Air Force Broadcasts, generally, 29 minutes).

DME ..... UHF standard (TACAN compatible) distance measuring equipment.

H ..... Non-directional radio beacon (homing), power 50 watts to less than 2,000 watts.

HH ..... Non-directional radio beacon (homing), power 2,000 watts or more.

H-SAB ..... Non-directional radio beacons providing automatic transcribed weather service.

ILS ..... Instrument Landing System (voice on localizer channel).

LMM ..... Compass locator station when installed at middle marker site.

LOM ..... Compass locator station when installed at outer marker site.

MA ..... Range (adcock, vertical raditors), power less than 50 watts.

MH ..... Non-directional radio beacon (homing) power less than 50 watts.

ML ..... Range (loop radiators), power less than 50 watts.

MRA ..... Range (adcock, vertical radiators), power 50 watts or more but less than 150 watts.

MRL ..... Range (loop radiators), power 50 watts or more, but less than 150 watts.

RA ..... Range (adcock, vertical radiators), power 150 watts or more.

RL ..... Range (loop radiators), power 150 watts or more.

S ..... Simultaneous range, homing signal and/or voice.

SABH ..... Non-directional radio beacon having limited navigational use. Provides automatic weather broadcasts.

TACAN ..... UHF navigational facility—omnidirectional course and distance information.

VOR ..... VHF navigational facility—omnidirectional, course only.

VOR/DME ... Collocated VOR navigational facility and UHF standard distance measuring equipment.

VORTAC ... Collocated VOR and TACAN navigational facilities.

W ..... Without voice facilities on range frequency.

Z ..... VHF station location marker at a LF range station.

NOTES

1. All FAA MH facilities operate continuously unless otherwise cited.
2. All FAA ranges operate continuously. Those which are not manned continuously are cited in the remarks with hours of operation in parentheses, e.g., (0600–2400).
3. LMF and VHF ranges listed at the same location are controlled by the same FSS.
4. Military navigational facilities which are not part of the common system are not listed in this publication.

Section III–A—NOTICES TO AIRMEN

This section is issued every 14 days and is primarily designed to supplement Section III of the AIM. It contains appropriate notices from the daily NOTAM Summary, Airmen Advisories, new or revised Oil Burner Routes and other items considered essential to flight safety.

NOTE: Data preceded by a checkmark (✓) are considered permanent and will usually be cited only once. Such information should be noted on charts and records. Temporary information is continuously cited until the condition is no longer in effect.

NOTE: Data are arranged in alphabetical order by State (and within the State by City or locality).

NEW OR REVISED DATA: New or revised data are indicated by underlining the first line of the affected item. The new information is not necessarily limited to the underlined portion, which is used only to attract attention to the new insert.

ALABAMA

BAYOU LA BATRE, BAY VIEW ARPT: Paved 3000′ drag strip 75′S and parallel to turf rnwy. P-line each side of drag strip and wire across strip 75′ from E end. N/S turf rnwy under constr, covered with stumps not to be used for acft operns.

BRANTLEY MUNI ARPT: Clsd UFN.

MOBILE, BATES FLD: Rnwy 18–36 restricted to acft of GWT 12,500 lbs or less for tkoffs and lndgs except in emgcy.

SELMA, SELFIELD ARPT: Rnwy 18–36 clsd until aprxly July 1966. VFR acft ctc Craig Twr on 126.2 for tfc and lndg advisories.

ARIZONA

BOUSE ARPT: Clsd until aprxly Nov. 1965.

GRAND CANYON NATIONAL PARK ARPT: Clsd for constr.

MARICOPA: CAUTION—DO NOT MISTAKE FOR LANDING AREA. Space Surveillance Stn at lat 33°06′31″, long 112°01′46″ aprxly 4 mi N. 1200′ W and parallel to hwy. Site is strip 300′ x 1800′ with paved portion lengthwise thru cntr 100′ in width and studded with 6′ steel posts. This permanent hazard lctd 22 nmi S Phoenix-Sky Harbor Arpt.

NOGALES INTL ARPT. Rnwy 3–21 clsd for resurfacing. Use parallel txwy for lndgs dalgt hrs.

How to Report an Accident

Notification Requirements

The pilot, or operator, of an aircraft of U.S. registry *must immediately* notify the FAA of any aircraft accident which:

(a) Is known or believed to have been caused by structural failure of the aircraft, engine, or propeller.
(b) Involves midair collision of two or more aircraft.
(c) Results in serious injury to any person, or fatal injury to any person not an occupant of the aircraft.
(d) Involves fire in any of the components or systems on board the aircraft regardless of the extent of injury to the occupants or damage to the aircraft.

The pilot, or operator, shall notify the nearest FAA Flight Service Station, or General Aviation District Office informing them of:

1. Location.
2. Date.
3. Time of day.
4. Number of persons involved.
5. Injuries to each.
6. Aircraft registration number.
7. Aircraft make and model.
8. Names of crewmembers and operator.
9. The circumstances surrounding the accident.

Reporting Requirements

The pilot, or operator, of an aircraft of U.S. registry must, as soon as possible, after the accident, complete a written report to the FAA if the accident involved:

(a) Serious or fatal injury to a nonoccupant of the aircraft, or
(b) Estimated repair cost of $300 or more.

The written report must be submitted in triplicate on Form FAA-916 and mailed or delivered to the nearest FAA General Aviation District Office or Regional Office, or to the State aviation official or investigator, where applicable. (CAB Safety Investigation Regulations, Part 320, Subch. II.)

15861

EXAM-O-GRAM NO. 12
THE MAGNETIC COMPASS

The Magnetic Compass

The magnetic compass, in terms of its errors, limitations, and in-flight characteristics, is one of those aeronautical subjects in which consistently large numbers of pilots fare poorly on FAA written examinations. There is evidence that this veteran instrument—it was one of the first to be installed in an aircraft—is one of the least understood instruments in the cockpit of today's modern general aviation aircraft. Many pilots seem to operate on the premise that it is easier to ignore this instrument's errors than it is to learn them. However, it should be remembered that (1) this is the only directional-seeking instrument in the cockpit of most general aviation aircraft, and (2) it is mechanically a simple, self-contained unit (independent of external suction or electrical power for its operation) that is likely to remain reliable at all times—reliable, that is, if the pilot understands its inherent errors.

WHAT ARE SOME OF THE COMPASS ERRORS THAT THE PILOT SHOULD UNDERSTAND?

The pilot should understand:

I. VARIATION—This is the angular difference between *true north* and *magnetic north* which is plotted on charts in *degrees east or west.* The pilot should understand perfectly *which to add and which to subtract* when converting from true headings or courses to magnetic headings or courses and vice versa. (Many pilots find such memory aids as "east is least and west is best" helpful in remembering that *east is subtracted* and *west is added* when going from *true* to *magnetic.*)

II. DEVIATION—This is the deflection of the compass needle from a position of magnetic north as a result of local magnetic disturbances in the aircraft. To reduce this deviation, the compass has a compensating device consisting of small adjustable magnets. The compass should be checked and compensated periodically. The errors remaining after "swinging" the compass should be recorded on a compass correction card which should be installed in the cockpit within the view of the pilot. (NOTE: Avoid placing metallic objects such as metal computers, flashlights, etc., on top of the instrument panel near the magnetic compass as this practice may induce large amounts of deviation and seriously affect the instrument's accuracy.)

In addition to these errors, the pilot should have a *working knowledge* of the following in-flight errors:

III. OSCILLATION ERROR — The erratic swinging of the compass card which may be the result of turbulence or rough pilot technique.

C015862

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: III. AUTOMATIC TRANSMISSION

PERFORMANCE OBJECTIVE NO.: 2 TITLE: Remove and Replace Automatic Transmission

CONDITIONS:

This assignment will be performed on a complete automobile. Under tests and checks, all tests and checks will be performed, omitting only the road test.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Raise hood
6. Place protective covers on fenders
7. Disconnect or remove all parts and accessories which must be disconnected or removed when working over fender
8. Position hoist lift arms to correct position under automobile frame and raise automobile to comfortable working height
9. Remove drive shaft
10. Disconnect or remove parts and accessories required for transmission removal following all steps as outlined in the manual

PERFORMANCE CRITERIA:

1582

IV. MAGNETIC DIP—The tendency of the magnetic compass to point down as well as north in certain latitudes. This tendency is responsible for:

A. Northerly Turn Error—*This error is the most pronounced of the in-flight errors.* It is most apparent when turning to or from headings of north and south.

B. Acceleration Error—An error that can occur during airspeed changes. It is most apparent on headings of east and west.

As a quick refresher on this instrument's in-flight dip error, we invite you to accompany us on a simulated demonstration flight around the compass rose. Unless otherwise noted, we will limit our bank during turns to a gentle bank. Also, we will assume that we are in the northern hemisphere because the characteristics which we will observe would not be present at the magnetic equator, and would be reversed in the southern hemisphere.

DEMONSTRATION NO. 1 (Heading—North; Error—Northerly Turn Error)

As we start a turn in either direction from this heading, we notice that momentarily the compass *gives an indication of a turn opposite the direction of the actual turn.* (While the compass card is in a banked attitude, the vertical component of the earth's magnetic field causes the north-seeking end of the compass to dip to the low side of the turn, giving the pilot an erroneous turn indication.) If we continue the turn toward east or west, the compass card will begin to indicate a turn in the correct direction, *but will lag behind the actual turn*—at a diminishing rate—until we are within a few degrees east or west. One additional demonstration which we will cover before leaving north is the Slow Turn Error. If, while holding a compass indication of north, we sneak into a very gradual and shallow banked turn—say 3° or 4° of bank—it is possible to change the actual heading of the aircraft by 20° or more *while still maintaining an indication of north by the compass.*

DEMONSTRATION NO. 2 (Heading—East; Error—Acceleration Error)

The Northerly Turn Error that we previously experienced is not apparent on this heading (or on a west heading). However, let's see what happens when we accelerate and decelerate by changing the airspeed. With the wings level, we will *increase* the airspeed by increasing the power setting or by lowering the nose, or both. Result—although we are holding the nose of the aircraft straight ahead, our compass card erroneously indicates a turn toward *north.* On the other hand, if we decrease the airspeed by reducing the power setting or raising the nose of the aircraft, or both, the compass will give an erroneous indication of a turn toward *south.* (Because of the pendulous-type mounting, the end of the compass card, which the pilot sees, is tilted upward while accelerating and downward while decelerating during changes of airspeed. This momentary deflection of the compass card from the horizontal, results in an error that is most apparent on headings of east and west.)

DEMONSTRATION NO. 3 (Heading—South; Error—Northerly Turn Error)

Again we are presented with the Northerly Turn Error problem that we encountered in Demonstration No. 1. Although the same set of forces that caused the erroneous indication when we banked the aircraft while on a north heading will likewise be working against us on this heading, the compass indications will appear quite different. For example, as we roll into a turn in either direction, the compass gives us an indication of a turn in the *correct direction*

S345863

but at a *much faster rate than is actually being turned.* As we continue our turn toward west or east, the compass indications will continue to precede the actual turn—but at a diminishing rate—until we are within a few degrees of west or east. (It might be noted that the Acceleration Error is not apparent on this heading or on a north heading.)

DEMONSTRATION NO. 4 (Heading—West; Error—Acceleration Error)

On this heading we encounter the exact same errors that we have previously covered on a heading of east in Demonstration No. 2. If we *increase the airspeed,* we will get an erroneous indication of a *turn toward north.* If we *decrease the airspeed,* we will get an erroneous indication of a *turn toward south.* (A memory aid that might assist you in recalling this relationship between airspeed change and direction of the error is the word ANDS—Accelerate-North, Decelerate-South.)

WHAT ARE THE MAIN POINTS THAT SHOULD BE REMEMBERED CONCERNING THESE FOUR DEMONSTRATIONS?

The points we are trying to get across are these: (1) WHEN TAKING READINGS FROM THE MAGNETIC COMPASS WHILE ON A NORTHERLY OR SOUTHERLY HEADING (for establishing a course, setting the gyro-driven heading indicator, etc.), REMEMBER THAT IT IS ESSENTIAL TO HAVE THE WINGS PERFECTLY LEVEL FOR SEVERAL SECONDS PRIOR TO TAKING THE READING. (2) IF YOU ARE ON AN EASTERLY OR WESTERLY HEADING, IT IS IMPORTANT THAT THE AIRSPEED IS CONSTANT IN ORDER TO GET AN ACCURATE READING. (3) ON AN INTERMEDIATE HEADING, BOTH OF THE ABOVE CONDITIONS SHOULD BE MET. (Note: If your aircraft is equipped with a gyro-driven heading indicator, check it frequently with your magnetic compass.)

TURNS TO HEADINGS BY REFERENCE TO THE MAGNETIC COMPASS

For the pilot who would like a general set of rules for determining his lead point for making turns by reference to the Magnetic Compass, the following is submitted:

(NOTE: The angle of bank should not exceed 15° in order to minimize dip error.)

1. *When turning to a heading of north you must allow, in addition to your normal lead, a number of degrees approximately equal to the latitude at which you are flying. Example:* You are making a left turn to a heading of north in a locality where the latitude is 30°N. You have previously determined your normal lead to be approximately 5° for this particular angle of bank. In this case, you should start your rollout when the compass reads approximately 35°.
2. *When turning to a heading of south, you must turn past your normal lead point by a number of degrees approximately equal to the latitude at which you are flying. Example:* You are making a right turn to a heading of south in a locality where the latitude is 30°N. You have previously determined your normal lead to be approximately 5° for this particular angle of bank. In this case, you should turn past your normal lead point of 175° (180° — 5°) by 30°, and start your rollout when the compass reads approximately 205°.
3. *The error is negligible when turning to east or west; therefore, use the normal amount of lead when turning to an east or west heading.*
4. *For intermediate headings that lie between the cardinal headings, use an approximation based on the heading's proximity to north or south, the direction of the turn, and your knowledge of the compass's lead and lag characteristics in these areas.* In other words, use an "educated guesstimate".

We won't guarantee you that the above method will roll you out on the exact heading every time—at best, it is an approximate method. But it will get you reasonably close to your desired heading, and this beats having no method at all.

KNOW YOUR MAGNETIC COMPASS

15864

How to Obtain EXAM-O-GRAMS

Many EXAM-O-GRAMS for Private, Commercial, and Instrument Pilots have been published, and as the need arises, more will be made available. Some EXAM-O-GRAMS are intended to provide specific, detailed information on those subjects that seem to cause applicants the most difficulty on examinations. Other EXAM-O-GRAMS deal with items of vital importance to the pilot, but available information may not adequately cover the subject for various reasons. All of the EXAM-O-GRAMS should prove most useful on any training program.

EXAM-O-GRAMS are distributed free to ground school operators, flight school operators, ground instructors, flight instructors, etc. Any individual in these classifications who wishes to be placed on the EXAM-O-GRAM mailing list should address his request to:

FAA Aeronautical Center
Flight Standards Technical Div.
Operations Branch, AC–240
P.O. Box 25082
Oklahoma City, Oklahoma 73125

NOTE: Normally, only single copies are distributed to each operator or instructor. Sufficient quantities are not available to supply all pilots and participants in ground school classes. However, they may be reproduced by recipients in any way desired.

BIBLIOGRAPHIC CITATIONS; COURSE CONTENT; TRANSPARENCIES; INSTRUCTIONAL MATERIALS

ABSTRACT - Developed by the Instructional Materials Laboratory at the University of Kentucky, this instructional unit is designed to develop abilities needed in managing dairy herds. Seven competency areas are presented with suggested teaching time, suggested references, and suggested instructional materials for each area. References, transparency masters, and major features of three common dairy herd testing programs are appended. A related document in this issue is available as VT 013 006. (GB)

DAIRY

UNIT (MODULE): MANAGING THE DAIRY HERD

Major Teaching Objective

To develop the effective ability to manage the dairy herd

Suggested Learnings (Competencies) To Be Developed

1. To take proper care of the dairy herd
2. To plan a good record system
3. To cull the dairy herd properly
4. To provide replacements to the dairy herd
5. To use labor efficiently
6. To provide adequate facilities for the dairy
7. To market high quality dairy products

UNIT (MODULE): MANAGING THE DAIRY HERD

Suggested Teaching Time

Number of class periods for group teaching:

In classroom, at school . . . . . _____
Outside classroom, at school . . . . . _____
Field Trips (away from school) . . . . . _____

Total . . . . . _____

Month(s) _____

Place of the Unit in the Course of Study

This is the fifth unit dealing with dairying, for use in high school vocational agriculture classes. The other four units are: (1) "Getting Started in Dairying," (2) "Selecting and Breeding Dairy Animals," (3) "Feeding Dairy Cows," and (4) "Controlling Parasites and Diseases." This unit deals with managing the dairy herd. Learnings in breeding, feeding, and disease and parasite control are not dealt with in this unit because they are covered in units 2, 3, and 4. The learnings found in units 2, 3, and 4, may also be secured from specific application of learnings found in the General Farm Animal Units (HS-33, HS-34, HS-35, and HS-36).

If dairy cattle is not in the course of study, this unit should not be used. If dairying is in the course of study, then this unit should probably be used in the sophomore, junior, or senior year. This could be an essential part of an advanced Dairying course. Regardless of where it is found, it should develop in the student the ability to properly manage dairy animals in order to secure the most efficient production.

Suggestions for Introducing the Unit

In introducing this unit, the importance of good management in dairying should be pointed out. Many farmers do a poor job of managing the dairy enterprise, and poor management results in inefficiency and low profits or no profits.

After sufficient interest has been created, the boys should be led to suggest the phases of management which needs to be considered. Any learning previously dealt with in another unit should be omitted. All seven of the learnings may prove helpful in developing managerial skills. This unit may require from ten to fourteen days to secure these learnings. One or two field trips may prove helpful. One trip to see a good dairy herd may be valuable. Another trip to visit good facilities and a good milking operation using labor saving equipment might prove valuable in relating learnings to the specific application.

15868

c. Use good milking procedures

-- Remove milker at the proper time
-- Avoid excessive vacuum
-- Keep milking parlor and equipment clean
-- Clean the cow's udder properly before milking

d. Try "Challenge Feeding" on the cows to boost production
e. Feed grain on the basis of production
f. Provide an adequate amount of a good-quality pasture in the summer and good quality roughage in the winter

Feeding and breeding are discussed in other units

Proper care of cows during dry period

a. Give cows a 6 to 8-week rest period
b. Feed cows enough concentrates to prevent excessive loss of flesh
c. If cows are in poor flesh, feed some concentrates each day (see feeding unit).
d. Dry cows should have access to succulent pasture or high-quality roughages.
e. Feed a laxative concentrate at least 2 weeks before calving (wheat bran and oats)

Caring for the herd bull (If you do not use artificial breeding)

a. Don't over-breed young bulls
b. Train the bull to lead while he is a calf
c. Bulls should be dehorned as a calf
d. Keep the bull in a pen large enough to get adequate exercise
e. Put a ring in the bull's nose when he is 8 months to 1 year of age.
f. Feed enough grain, minerals, and roughages to keep the bull in good breeding condition (not fat)

Grooming the cow

a. Regular grooming is necessary
b. Keep the cow's feet properly trimmed
c. Clip the cow's udder and surrounding areas
d. Grooming helps keep cows gentle

<u>Suggested Teaching-Learning Activities</u>

a. Suggested problem: How take proper care of the dairy herd?
b. A field trip to see a good dairy operation may be a good way to summarize this learning. A talk with the herd manager may prove very helpful in making concrete the experience.
c. Use transparency HS-51-1 with the learning.

Suggested References and Instructional Materials

Books

Dairy Production	pp. 186-198
Dairy Cattle Feeding and Management.	pp. 205-207
Approved Practices in Dairying	pp. 79- 94
Introduction to Livestock Production	pp. 584-591
Livestock and Poultry Production	pp. 345-350

Publications

"Dairy Production," (Mississippi)	pp. 146-153, 175-179, 211-214
"Making Your Dairy Pay" (Southern States).	Chapter 8, pp. 79-87, 99-102, 131-133

Transparencies

HS-51-1 (The Dairyman's Cost)

2. To plan a good record system

Records to keep

a. Production -- DHIA plan, owner-sampler plan, and WADAM plan
b. Feeding -- kind of feed, amount of feed being fed, etc.
c. Breeding -- breeding and calving date, the bull used, sex of calf, etc.
d. Health -- record of vaccinations, tests, and treatments for various diseases.

Reasons for keeping records

a. The dairy herd cannot be profitably managed unless records are kept.
b. Adequate records remove much of the uncertainty in the operation of a dairy farm.
c. Good records cause greater profits, better feeding practices, increased production, improvement in quality of cattle kept, and more efficient use of labor.
d. Production records make it much easier to decide which animals should be culled.

Keeping records

a. Records must be kept accurately, but they need not be elaborate.
b. They should be complete and up-to-date.
c. The person keeping the record may carry a small notebook and record information at the time an event occurs.
d. Transfer the records to a permanent record book at the end of each day or week.
e. Record system should be handy (record book kept in a convenient place).

15870

15871

Suggested Teaching-Learning Activities

a. Suggested problem: How keep records on our dairy herd?
b. Involving the students in this learning is a must if any desirable learning is to take place. Ask the students to compare the recordkeeping systems, and decide which one they would prefer to use, and explain why.
c. Use transparency HS-51-2 with this learning.

Transparencies

HS-51-2 (Major Features of Three Common Dairy Herd Testing Programs)

3. To cull the dairy herd properly

Reasons for culling

a. High-producing cows mean higher returns for your labor.
b. Fewer cows to house and care for
c. Production costs are lower
d. The receipts from the sale of a cull cow can buy a good heifer in her place.

Cows to cull

a. Cows with diseased udders
b. Shy breeders
c. Slow, hard milkers
d. Non breeders
e. Cows producing below the herd average
f. Brucellosis reactors
g. The tempermental cow
h. A cow that has become so badly crippled that she has difficulty getting around

15872

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: III. AUTOMATIC TRANSMISSION

PERFORMANCE OBJECTIVE NO.: 3 TITLE: Remove, and Replace Automatic Transmission

CONDITIONS:

BEHAVIOR:

11. Remove transmission following steps as outlined in manual
12. Perform all tests and checks following all steps as outlined in the manual
13. Make all bench adjustments following all steps as outlined in the manual
14. If all tests, checks, and adjustments are satisfactory, install transmission in automobile following all steps as outlined in the manual
15. Reconnect and install parts and accessories (under the automobile connections) as outlined in the manual
16. Install drive shaft
17. Check all work up to this point and if it is satisfactory, lower automobile to the floor
18. Connect all parts and accessories (over the fender connections) as outlined in the manual
19. Make all tests, checks, and adjustments as outlined in the manual
20. If all tests, checks, and adjustments are satisfactory, return tools and materials to proper place

PERFORMANCE CRITERIA:

1583

When to cull

a. Sell a cow when she will no longer make you money
b. Sell poor first-calf heifers

Suggested Teaching-Learning Activities

a. Suggested problem: How should we cull our dairy herd?
b. Use transparency HS-51-3 with this learning.

Suggested References and Instructional Materials

Books

Dairy Production . . . . . pp. 33-34
Dairy Cattle Feeding and Management. . . . . pp. 317-318
Approved Practices in Dairying . . . . . pp. 72-73

Transparencies

HS-51-3 (High Producers Pay)

Publications

Farmers Bulletin 2132 . . . . . pp. 3-4

4. To provide replacements

Things to consider in selecting cows and heifers

Type -- general appearance, dairy character, body capacity, and mammary system
Pedigree
Production records
Health
Vigor
Mammary development in heifers
Size

Things to consider in selecting the herd bull (Much of this needs to be done if breeding artifically as well)

Type (as shown on score card)
Production increase of the daughter over the dam
Consistency of increase
Proven sire--the records of ten daughters or more compared with the records of their dams
Healthy
Vigorous
Strong
Large

15873

15873

Growing replacements

a. Whether to produce own replacements
b. Number of heifers to keep
c. Kind of heifers to keep

Buying replacements

a. Appearance
b. Production records
c. Age
d. Diseases
e. Know your source of supply

Suggested Teaching-Learning Activities

a. Suggested problem: How provide good replacements for our dairy herd?
b. Bringing in a good dairy heifer and discussing her good characteristics with the students may prove helpful with this learning.
c. Use transparency HS-51-4-1 and HS-51-4-2 with this learning.
d. Take advantage of all possible labor-saving devices (feed carts, silo unloaders, pipe-line milkers, bulk tank, elevated milking parlor, and others).

15874

5. <u>To use labor efficiently</u>

Need for using labor efficiently

a. Under average conditions between 90-150 man hours each year are needed to take care of a dairy cow.
b. Feed is the only other cost that is higher than labor.
c. Save labor -- increase income

Present labor-use situation on our farm

a. There is a wide range in the time requirements on dairy farms (each boy should decide how efficient he is in the use of labor).
b. If the present situation requires 150 or more hours per cow, improvement needs to be made.
c. Each boy should make a survey of his use of labor, and strive for efficiency.

Ways of saving labor

a. Careful and complete planning of the housing
b. Replace hand work with machinery whenever possible
c. Arrange the barn so that labor-saving equipment may be used in cleaning out the manure
d. Arrange the feed in a convenient location
e. The housing and equipment should be planned to reduce the time required to care for the cow.
f. Take advantage of all possible labor-saving devices (feed carts, silo unloaders, pipe-line milkers, bulk tank, elevated milking parlor, and others).

Scheduling work

a. Plan for one job to end where another begins
b. Schedule work for the total enterprise and not for one single phase
c. Make the needed changes in the dairy enterprise to save labor or to use labor more efficiently
d. Make an over-all plan for efficient use of labor

<u>Suggested Teaching-Learning Activities</u>

a. Suggested problem: How should we use our labor to get the best results from the dairy operation?
b. A field trip to a dairy farm to see the facilities would provide a good opportunity to mention efficiency in labor. (Field trip recommended in Learning 6.)

15874

6. To provide adequate facilities

Housing

a. Type of barn

-- Loose housing system
-- Stanchion system

b. Location of barn
c. Lighting conditions
d. Milk room

-- Location
-- Ventilation
-- Health precautions

e. Feed storage area
f. Maternity quarters
g. Bull facilities

-- Shelter
-- Fencing
-- Size of lot

h. Calf pens

Equipment

a. Feeding equipment

-- Self-feeding hay racks
-- Silo
-- Mechanical feeders

b. Milking equipment

-- Varies from seamless covered milk pail, milk strainer, milk can and cooler, to elaborate pipe-line milkers
--

15876

c. Cooling equipment

-- Bulk cooler (if grade A milk is produced)
-- Can cooler (if milk is produced for manufacturing purposes)

d. Cleaning equipment

-- Manure loader
-- Brooms, shovels, waterhose, etc.

e. Miscellaneous

-- Scales
-- Truck (1/2 or 3/4 ton)
-- Tractor

Suggested Teaching-Learning Activities

a. Suggested problem: What facilities do we need in our dairy business?
b. A field trip to a good dairy operation would be very helpful here. The herdsman could discuss the efficiency of the business, as well as how the equipment and facilities meet the needs of the farm.

15876

7. To market high quality dairy products

Marketing during high prices

Plan to market much of the milk produced when milk is selling at a high price (usually in fall and winter months).

Forms

a. Fluid milk (Grade A is best)
b. Milk for manufacturing purposes

Butterfat content -- high or low percent of butterfat - breeds, feed, etc.

Quality

a. From healthy cows (TB-free herd, Bang's-free herd)
b. Bloody, stringy, and other abnormal milk produced from cows with mastitis shall be excluded.
c. Dirt in milk undesirable
d. Bacteria in milk kept to a minimum

-- Clean cow's udder properly at milking time
-- Have barn lot well drained and clean
-- Keep milking equipment in good shape and clean
-- Milkhouse properly equipped with pure water (hot & cold), proper wash and rinse racks, and a good cooling tank

e. Keep antibiotics and pesticides out of milk

Suggested Teaching-Learning Activities

a. Suggested problem: How should we market our milk?
b.

Evaluation of Unit

This unit may best be evaluated in terms of its usefulness in securing the significant learnings with the students. On your farm visits you will have opportunity to see what changes are taking place in the students and their farming program. The students, who earlier listed good practices in management, may now be led to compare those practices with those they are using in their farm experience program. If there is a significant difference help them to see the need to carry out the practices they listed earlier.

Evaluate with the students the teaching of the unit. Ask the class how the unit could have been improved. How could it have been made more interesting? Were the field trips and visual aids helpful?

THE DAIRYMANS COST

15881

MAJOR FEATURES OF THREE COMMON

DAIRY HERD TESTING PROGRAMS

DHIA - DAIRY HERD IMPROVEMENT ASSOCIATION

a. Complete milk and butterfat production figures on cows, plus herd averages

b. Gives feed consumption and returns over feed costs

c. Records are accepted as official, a disinterested party (DHIA Supervisor) weighs milk, records information, and performs butterfat tests

OS - OWNER-SAMPLER

a. Provides <u>exactly</u> the same information as DHIA

b. Not considered official because herd owner weighs milk; and DHIA Supervisor performs butterfat tests

c. Less costly than DHIA

WADAM - WEIGH-A-DAY-A-MONTH

a. Least costly program available

b. Provides milk production information for individual cows only, no butterfat tests are performed.

c. Excellent for culling and feeding based on milk production

DAIRY COW UNIFIED SCORE CARD

Copyrighted by The Purebred Dairy Cattle Association, 1943. Revised, and Copyrighted 1957
Approved — The American Dairy Science Association, 1957

Breed characteristics should be considered in the application of this score card		Perfect Score
Order of observation		
1. GENERAL APPEARANCE		30
(Attractive individuality with, feminity, vigor, stretch, scale, harmonious blending of all parts, and impressive style and carriage. All parts of a cow should be considered in evaluating a cow's general appearance)		
BREED CHARACTERISTICS — (see reverse side)	10	
HEAD — clean cut, proportionate to body; broad muzzle with large, open nostrils; strong jaws; large, bright eyes; forehead, broad and moderately dished; bridge of nose straight; ears medium size and alertly carried		
SHOULDER BLADES — set smoothly and tightly against the body	10	
BACK — straight and strong; loin, broad and nearly level		
RUMP — long, wide and nearly level from **HOOK BONES** to **PIN BONES**; clean cut and free from patchiness; **THURLS**, high and wide apart; **TAIL HEAD**, set level with backline and free from coarseness; **TAIL**, slender		
LEGS AND FEET — bone flat and strong, pasterns short and strong, hocks cleanly moulded. **FEET**, short, compact and well rounded with deep heel and level sole. **FORE LEGS**, medium in length, straight, wide apart, and squarely placed. **HIND LEGS**, nearly perpendicular from hock to pastern, from the side view, and straight from the rear view	10	
2. DAIRY CHARACTER		20
(Evidence of milking ability, angularity, and general openness, without weakness; freedom from coarseness, giving due regard to period of lactation)		
NECK — long, lean, and blending smoothly into shoulders; clean cut throat, dewlap, and brisket **WITHERS**, sharp. **RIBS**, wide apart, rib bones wide, flat, and long. **FLANKS**, deep and refined. **THIGHS**, incurving to flat, and wide apart from the rear view, providing ample room for the udder and its rear attachment. **SKIN**, loose, and pliable	20	
3. BODY CAPACITY		20
(Relatively large in proportion to size of animal, providing ample capacity, strength, and vigor)		
BARREL — strongly supported, long and deep; ribs highly and widely sprung; depth and width of barrel tending to increase toward rear	10	
HEART GIRTH — large and deep, with well sprung fore ribs blending into the shoulders; full crops; full at elbows; wide chest floor	10	
4. MAMMARY SYSTEM		30
(A strongly attached, well balanced, capacious udder of fine texture indicating heavy production and a long period of usefulness)		
UDDER — symmetrical, moderately long, wide and deep, strongly attached, showing moderate cleavage between halves, no quartering on sides; soft, pliable, and well collapsed after milking; quarters evenly balanced	10	
FORE UDDER — moderate length, uniform width from front to rear and strongly attached	6	
REAR UDDER — high, wide, slightly rounded, fairly uniform width from top to floor, and strongly attached	7	
TEATS — uniform size, of medium length and diameter, cylindrical, squarely placed under each quarter, plumb, and well spaced from side and rear views	5	
MAMMARY VEINS — large, long, tortuous, branching	2	
"Because of the natural undeveloped mammary system in heifer calves and yearlings, less emphasis is placed on mammary system and more on general appearance, dairy character, and body capacity. A slight to serious discrimination applies to overdeveloped, fatty udders in heifer calves and yearlings."		
Subscores are not used in breed type classification.	**TOTAL**	100

PARTS OF A DAIRY COW

HS 51-4-1

IDEAL AYRSHIRE COW

IDEAL BROWN-SWISS COW

IDEAL GUERNSEY COW

IDEAL HOLSTEIN-FRIESIAN COW

IDEAL JERSEY COW

BREED CHARACTERISTICS

AYRSHIRE

Strong and robust, showing constitution and vigor, symmetry, style and balance throughout, and characterized by strongly attached, evenly balanced, well-shaped udder.

COLOR—Light to deep cherry red, mahogany, brown, or a combination of any of these colors with white, or white alone, distinctive red and white markings preferred, black or brindle objectionable.

SIZE—A mature cow in milk should weigh at least 1200 lbs.

HORNS—Inclining upward, refined, medium length and tapered toward tips. No discrimination for absence of horns.

GUERNSEY

Size and strength, with quality and character desired.

COLOR—A shade of fawn with white markings clearly defined. Skin should show golden yellow pigmentation. When other points are equal, a clear (buff) muzzle will be favored over a smoky or black muzzle. A bright golden yellow pigmentation on the nose, around the eyes, in the ears, in the escutcheon, around the udder and at the point of tail is favored.

SIZE—A mature cow in milk should weigh at least 1100 lbs. "In milk" means normal condition after having been in milk from 3 to 6 months.

HORNS—No discrimination for absence of horns.

JERSEY

Sharpness with strength indicating productive efficiency.

COLOR—A shade of fawn, with or without white markings.

SIZE—A mature cow in milk should weigh about 1000 lbs.

HORNS—Incurving, refined, medium length and tapering toward tips. No discrimination for absence of horns.

BROWN SWISS

Strong and vigorous, but not coarse. Size and ruggedness with quality desired. Extreme refinement undesirable.

COLOR—Solid brown varying from very light to dark. White or off-color spots objectionable. Females with any white or off-color markings above the underside of the belly or with white core in switch do not meet color standards of the Brown Swiss breed, and shall be so designated when registered. Pink noses and light streaks up the side of the face objectionable.

SIZE—The minimum weight for mature cows should be about 1400 lbs.

HORNS—Incurving and inclining slightly up. Of medium length, lacking coarseness, tapering toward tips. Polled animals not barred from registry. No discrimination for absence of horns.

HOLSTEIN

Rugged, feminine qualities in an alert cow possessing Holstein size and vigor.

COLOR—Black and white markings clearly defined. Color markings that bar registry are solid black, solid white, black in switch, black belly, black encircling leg touching hoof head, black from hoof to knee or hock, black and white intermixed to give color other than distinct black and white.

SIZE—A mature cow in milk should weigh at least 1500 lbs.

HORNS—No discrimination for absence of horns.

EVALUATION OF DEFECTS

In a show ring, disqualification means that the animal is not eligible to win a prize. Any disqualified animal is not eligible to be shown in the group classes. In slight to serious discrimination, the degree of seriousness shall be determined by the judge.

EYES
1. Total blindness: *Disqualification.*
2. Blindness in one eye: *Slight discrimination.*
3. Cross-eyes: *Slight discrimination.*

WRY FACE
Slight to serious discrimination.

CROPPED EARS
Slight discrimination.

PARROT JAW
Slight to serious discrimination.

SHOULDERS
Winged: *Slight to serious discrimination.*

TAIL SETTING
Wry tail or other abnormal tail settings: *Slight to serious discrimination.*

LEGS AND FEET
1. Lameness — apparently permanent and interfering with normal function: *Disqualification.*
   — apparently temporary and not affecting normal function: *Slight discrimination.*
2. Bucked knees: *Slight to serious discrimination.*
3. Evidence of arthritis, crampy hind leg: *Serious discrimination.*
4. Boggy hocks: *Slight to serious discrimination.*

ABSENCE OF HORNS
No discrimination.

LACK OF SIZE
Slight to serious discrimination.

UDDER
1. Blind quarter: *Disqualification.*
2. Abnormal milk (bloody, clotted, watery): *Possible disqualification.*
3. Udder definitely broken away in attachment: *Serious discrimination.*
4. A weak udder attachment: *Slight to serious discrimination.*
5. One or more light quarters, hard spots in udder, obstruction in teat (spider): *Slight to serious discrimination.*
6. Side leak: *Slight discrimination.*

DRY COWS
Among cows of apparently equal merit: *Give strong preference to cows in milk.*

FREEMARTIN HEIFERS
Disqualification unless proved pregnant.

OVERCONDITIONED
Slight to serious discrimination.

TEMPORARY OR MINOR INJURIES
Blemishes or injuries of a temporary character not affecting animal's usefulness: *Slight discrimination.*

EVIDENCE OF SHARP PRACTICE
1. Animals showing signs of having been operated upon or tampered with for the purpose of concealing faults in conformation, or with intent to deceive relative to the animal's soundness: *Disqualification.*
2. Uncalved heifers showing evidence of having been milked: *Serious discrimination.*

ABSTRACT - Developed by the Instructional Materials Laboratory at the University of Kentucky, this instructional unit is designed to develop abilities needed to get started in dairying. Six contemporary areas are presented with suggested teaching time, suggested references, and suggested instructional materials for each area. References, transparency masters, and comparison data of dairy cows are appended. A related document in this issue is available as VT 013 005. (GB)

DAIRY

Unit (Module): Getting Started in Dairying

Major Teaching Objective

To develop the effective ability to get started in dairying

Suggested Learnings (Competencies) To Be Developed

1. To evaluate dairying as a possible major livestock enterprise on our farms
2. To decide whether the home farm is suitable for dairying
3. To determine the probable returns from a dairy cow
4. To determine the size herd that should be on the home farm
5. To select dairy animals
6. To secure dairy animals

UNIT (MODULE): GETTING STARTED IN DAIRYING

Suggested Teaching Time

Number of class periods for group teaching:

In classroom, at school . . . . . _____
Outside classroom, at school . . . . . _____
Field trips (away from school) . . . . . _____
Total . . . . . _____

Month(s) _____

Place of the Unit in the Course of Study

This unit is for use in high-school classes of vocational agriculture. It is the first of five units in dairying. The other four units are: (1) Breeding, (2) Feeding Dairy Cows, (3) Controlling Parasites and Diseases, and (4) Managing the Dairy Herd.

This unit probably should not be used unless dairying is in the teacher's course of study. If dairying is in the course of study, this unit probably should be used in the sophomore year. The primary purpose of this unit is to develop the effective ability to get started in dairying.

Suggestions for Introducing the Unit

In introducing this unit, the students should realize the importance of getting a good start in the dairy business. If students select dairying as their major livestock enterprise, they need to do a good job of getting started in the business to make a good income.

The first four learnings are useful in helping the student decide whether he should select dairying as his major livestock enterprise. Once that decision has been made, learnings five and six should prove helpful in selecting and securing the dairy animals needed to carry out his plans. Perhaps eight to ten days might be needed to fully secure the learnings in this unit. A field trip to see a good dairy farm operation may prove helpful during or after the unit has been completed. Good supervisory visits by the teacher are essential in getting the students' decisions which were made as a result of having the unit, carried out.

Suggested Learnings (Competencies) To Be Developed

1. To evaluate dairying as a possible major livestock enterprise on our farms

Importance of dairying

15888

a. Dairying is one of the most important farm enterprises in Kentucky
b. The sale of dairy products ranks second only to the sale of cattle and calves.
c. Milk is a remarkable combination of food elements.

Opportunities in dairying

a. In selling milk

-- Grade A milk
-- Milk for manufacturing purposes

b. In purebred dairying

-- Registered cattle are used.
-- The production cost is high.
-- The initial cost is high.
-- Gross income is usually higher than from other types of dairying.

c. In replacement heifers

-- Labor involved in milking is eliminated.
-- Cheap feed can be used.
-- Areas where milk markets are not available can be used.

d. In cow pools

-- Make for larger business
-- Command a better sales outlet
-- Afford the use of better bulls

Personal interest

a. To be successful, we must have enthusiastic interest in our work.
b. Enjoy working with dairy cows
c. It must be enjoyable work as well as a means of making a living.
d. Interested in developing an efficient herd

Ability to do a good job

a. Are you good enough a feeder and manager to average 9000 pounds of milk per cow for the lower testing breeds or its equivalent for high-testing breeds?
b. To do a good job in dairying requires close supervision and attention to details.
c. Do you have sufficient finances to get started?
d. Do you have sufficient labor available?
e. Labor should be qualified labor (of a high quality.)

15889

15889

Advantages of dairying

a. Dairying fits well in diversified farming programs.
b. Cows are efficient consumers of roughages.
c. Dairying provides a stable income.
d. Dairy products improve the family diet.
e. Aids in maintaining soil fertility.

Disadvantages

a. A great deal of labor is required
b. Considerable capital is required.
c. There are many hazards in dairy production.
d. Substitutes for dairy products are affecting the dairy business.

Suggested Teaching-Learning Activities

a. Suggested problem: How evaluate dairying as a possible major livestock enterprise on our farms?
b. Discuss this learning well. A problem form may not be necessary if good class participation occurs.

Suggested References and Instructional Materials

Books

Approved Practices in Dairying, pp. 17-23
Introduction to Livestock Production, pp. 575-579
Livestock and Poultry Production, pp. 293-300
Dairy Production, Chapter 2
Dairy Cattle Feeding and Management, Chapter 1

Publications

"Making Your Dairy Pay, the Southern States Way," pp. 13-14
*"Dairy Production," (Mississippi), pp. 21-33

2. To decide whether the home farm is suitable for dairying

Size of farm

a. The farm should be large enough to produce most of the feed for the number of cows the labor on the farm can support.
b. As a general rule, it requires 3 to 4 acres of fairly good land per cow.
c. One hundred to 200 acres of good land is good size for a one-family dairy farm; 160 to 300 acres is good size for a farm using two fulltime men.
d. Dairy farming is rapidly becoming a big business.
e. Dairy herds are becoming larger and larger.

*Teacher Reference Only

15890

Kind of land

a. Dairying is adapted to farms where pasture is the basic feed crop.
b. Most Kentucky land is suitable for dairying.
c. The kind, quality, and amount of feed produced on a farm depends on the soil

Available markets

a. A good market is very important.
b. The future in the dairy business in in the marketing of high-quality whole-milk products.
c. The market will pay a premium for doing a good job.
d. Sharp competition for milk is good.
e.

Available labor

a. Dairying requires skilled labor.
b. Dairying requires a large amount of labor, distributed quite evenly through the year.
c.

Facilities

a. Barn

1. Feed-storage areas
2. Maternity quarters
3. Milk parlor
4. Milk room
5. Bull lot
6. Calf pens
7. Loafing area
8.

b. Equipment

1. Feeding
2. Milking
3. Cooling
4. Cleaning
5. Miscellaneous

Suggested Teaching-Learning Activities

a. Suggested problem: Should we have dairying on our farm?
b.

3. To determine the probable returns from a dairy cow

Items of receipts

a. Closing inventory
b. Fluid-milk sales
c. Calf
d. Manure

Items of expenses

a. Beginning inventory
b. Grain
c. Supplement
d. Hay
e. Silage
f. Pasture
g. Minerals
h. Interest on investment
i. Breeding
j. Housing and equipment
k. Electricity
l. Taxes
m. Insurance
n. Hauling milk
o. Veterinarian expense

RELATED INSTRUCTION

SCHOOL: PETERSBURG, VIRGINIA FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: IV. AUTOMATIC TRANSMISSIONS

PERFORMANCE OBJECTIVE NO: 4 TITLE: Disassemble, Check, and Reassemble Automatic Transmission

CONDITIONS:

Student will learn the related information listed below

LEARN	REFERENCE	SOURCE
1. Automatic Transmissions	1. Automatic Transmissions and Power Trains, by Crouse. pp. 209 through 335, 339 through 546 Automotive Chassis Workbook, by Crouse. Jobs 5 through 7 Automotive Mechanics, by Crouse. pp. 448 through 501	1. Related Information Class
2. "Power Transmission Trouble"	2. Filmstrip	2. Resource Materials Center
3. Automatic Transmissions	3. Teaching Machine card 18D	3. Teaching Machine (Shop)

1585

FORM FOR FIGURING
PROBABLE RETURNS PER COW FROM LABOR

Item of Receipts	Quantity	Price Per Unit	Total
Closing inventory (cow)			
Fluid milk			
Calf			
Manure			
	TOTAL		

Items of Expense	Quantity	Price Per Unit	Total
Beginning inventory (cow)	1		
Corn	30 bu.		
Supplement	300 pounds		
Alfalfa hay	2 tons		
Silage	3 tons		
Pasture	8 mos.		
Minerals	50 pounds		
Interest on investment	5 percent of value of cow		
Breeding	1		
Housing) Equipment)	10 percent of the value of building (or portions of buildings) and equipment used by the dairy enterprise divided by the total number of cows		
Electricity	$1.00 per month		
*Taxes ($1.50 per $100 assessed value - The assessed value is usually 1/3 of actual value.)			
*Insurance	$1.00 per $100 value of animal		
Hauling milk	$ .35 to $ .40 per 100 pounds		
Miscellaneous	$20 per cow		
Veterinarian expense	1 cow		

*For the herd, these are approximately 2 percent of the value of the cows.

12835

15893

Suggested Teaching-Learning Activities

a. Suggested problem: What returns should we expect from a dairy cow?
b. This learning lends itself to a "blackboard solution" or to a completion on an overhead transparency, with the boys helping to find the answers.
c. Use Transparency - HS-47-3 with this learning.

Suggested References and Instructional Materials

Books

Farming Programs, pp. 128-135.

Publications

*"Dairy Production" (Mississippi), pp. 68-70.

4. To determine the size herd that should be on the home farm

Production requirements for dairy cattle

a. Pasture, acres
b. Hay, tons
c. Silage, tons
d. Grain, bushels fo corn
e. Labor, hours
f. Barn room, square feet
g. Capital, dollars
h. Other costs

Consider the production requirements available for dairy cattle on the boy's home farm.

a. Acres of pasture
b. Tons of hay
c. Tons of silage
d. Tons of bedding
e. Amount of labor
f. Square feet of housing

Possible size dairy on our farms (cows)

Economical size herd for Kentucky

a. There is a best size herd for every farm.
b. A 35-cow herd is the minimum size for an economical unit.
c. Above 50 cows the cost of production per unit levels off greatly.
d.

15894

Number of replacement heifers needed

a. The average productive life of a cow is 3.9 years.
b. We need .4 heifer and .35 calf each year to replace each producing cow.
c. For 35 producing cows, we need 13 to 15 heifers and 12 to 13 calves each year.

Suggested Teaching-Learning Activities

a. Suggested problem: What size dairy herd should we have on the farm?
b. Use Transparency - HS-47-4 with this learning.

Suggested References and Instructional Materials

Books

Approved Practices in Dairying, pp. 50-56.
Farming Programs, pp. 91-92, 97-105.

Publications

"Vocational Agriculture" Notebook, pp. 8-9.

5. To select dairy animals

Type

a. General appearance
b. Body capacity
c. Dairy Character
d. Mammary development

Pedigree

a. A description of the sire and dam may be very helpful.
b. Study carefully the pedigree of an animal (before adding the animal to the herd).
c.

Production

a. The most reliable basis for selecting a cow is her record of production.
b. Care should be taken to find out the conditions under which the record was made.
c.

15895

Health and vigor

a. Be sure the tests have been made recently for tuberculosis, Bang's disease, and mastitis.
b. Buy only disease-free animals.
c. Seven percent of the animals in herds are sold annually because of diseases.

Size

a. A dairy cow should be above average in size for the breed.
b. Large enough to consume a large amount of feed
c. The cow should be large enough to consume an adequate amount of feed for good production.

Mammary development

a. A good cow must have a good udder.
b. The udder should be large.
c. An udder with good texture is soft and pliable.
d. The teats should be squarely placed on the udder.
e. The four quarters should be of equal size.
f. Mammary veins should be large, prominent, long, and tortuous.
g. Heifer's mammary glands develop in a definite pattern
h. Udder should be well attached.

Defects

a. Irregular teat placement
b. Poor eyesight
c. Poor teeth
d. Poor front or rear udder attachment
e.

Reliable source

a. Honest breeders will stand behind their products.
b. The fanciest barns, highest priced livestock, and good salesmen do not necessarily have the best stock available for the money.
c. Before we buy animals, we should see them under normal conditions on the farm.
d. The buyer should observe conditions under which the production records were made.

Suggested Teaching-Learning Activities

a. Suggested problem: What kind of dairy animals should we select?
b. A field trip to see a good dairy farm operation and some good animals would be helpful at this point. Be sure that the factors in selecting dairy animals are made clear to the students.
c. The use of Transparencies - HS-47-5-1, 2, 3, and 4 may prove useful.

15896

Suggested References and Instructional Materials

Books

Approved Practices in Dairying, pp. 36-42.
Dairy Production, Chapter 4

Introduction to Livestock Management, pp. 272-283.
Farming Programs, pp. 108-113.
Livestock and Poultry Production, Chapter 17.

Publications

"Making Your Dairy Pay the Southern States Way," pp. 16-19.

6. To secure dairy animals

Partnership with parents

a. The son may be a partner with the father in carrying out the dairy enterprise.
b. In this case, each should share in the income according to what he contributes.
c. The father's advice is helpful to the son.
d. The father will furnish the farm, buildings, and most of the equipment.
e. The boy will furnish most of the labor.
f. The father and son share in the ownership of the animal(s). This should involve a trade agreement.

-- It should be written and handled in a businesslike manner.
-- The agreement should be fair.
-- The terms of the contract should be stated.
-- It should be simple and complete.

Self-financing

a. It is sound business to self-finance as much as possible.
b. Self-financing requires no outlay of interest money.
c.

Using borrowed money

a. Borrow from one of the following sources:

1. Bank
2. Production Credit Association
3. Parents
4. Other people
5.

15897

b. Make proper plans before borrowing money.

1. Make plans for borrowing money.
2. Plan for paying off the loan as soon as possible.
3.

Suggested Teaching-Learning Activities

a. Suggested problem: How should we secure our dairy animals?
b. It may be desirable for the teacher to help the boy in selecting and making arrangements for the purchase of the livestock.

Evaluating the Unit

This unit should be evaluated in terms of the teachers' objectives, and the decisions made by the students. As the teacher visits the students, he should try to evaluate the effectiveness of the teaching in terms of the quality of the dairy project the student initiates.

Evaluate with the class the teaching of the unit. All aids, techniques, and materials should be carefully evaluated after the unit has been completed.

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: IV. AUTOMATIC TRANSMISSION

PERFORMANCE OBJECTIVE NO.: 4 TITLE: Disassemble, Check, and Reassemble Automatic Transmission

CONDITIONS:

This assignment will be performed on a transmission obtained from the parts storage room. Under performance checks and tests, perform only bench tests and checks on this unit.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Obtain transmission from parts storage room
2. Select proper manual and turn to appropiate chapter
3. Select proper tools and materials
4. Disassemble transmission following all steps as outlined in the manual
5. Identify all parts and their functions
6. Perform tests and checks following all steps as outlined in the manual
7. Reassemble tranmission following all steps as outlined in the manual
8. Perform all bench checks and tests following all steps as outlined in the manual
9. If all tests and checks are satisfactory, return transmission to storage room
10. Return tools and materials to proper place
11. Clean work area for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily disassemble, check, reassemble, and bench test automatic transmission in 8 hours.

Learning time: 20 hours

A COMPARISON OF AVERAGE PRODUCTION PER COW
BETWEEN KENTUCKY DHIA HERDS AND ALL KENTUCKY HERDS

Year	DHIA HERDS (Pounds of Milk)	ALL KENTUCKY HERDS (Pounds of Milk)
1966	10,921	6,540
1968	11,300	6,800

There is usually over 4000 pounds difference between these two average figures.

VT 013 031
A Business Education Individualized Continuous Progress Research Curriculum Development Study. Volume I.

Weber County School District, Utah.
Utah State Board of Education, Salt Lake City.
MF AVAILABLE IN VT-ERIC SET.
PUB DATE - 70 121p.

DESCRIPTORS - *BUSINESS EDUCATION; *INSTRUCTIONAL MATERIALS; BOOKKEEPING; TYPEWRITING; OFFICE MACHINES; *INDIVIDUALIZED INSTRUCTION; TESTS; *ASSIGNMENTS; ACCOUNTING; *PROGRAMED MATERIALS; SECONDARY EDUCATION; BEHAVIORAL OBJECTIVES; COURSE CONTENT

ABSTRACT - With the support of school administrators, several business education teachers developed this package of individualized curriculum materials. These materials are arranged in three parts which pertain to beginning typewriting, beginning and advanced business machines, and bookkeeping. Following the continuous progress approach, this color-coded document includes assignments and quizzes for each of the above units as based on selected textbooks. Behavioral objectives for the student and instructions for the teacher are also included. A second volume for shorthand, transcription, and secretarial procedures is available as VT 013 032, also in this issue. (JS)

VOLUME I

1970

A BUSINESS EDUCATION INDIVIDUALIZED CONTINUOUS PROGRESS RESEARCH CURRICULUM DEVELOPMENT STUDY, REPORTED IN TWO VOLUMES.

VOLUME I

PART ONE

A GENERAL INTRODUCTIVE COURSE TO BEGINNING TYPEWRITING USING THE INDIVIDUALIZED CONTINUOUS PROGRESS APPROACH.

PART TWO

AN INTRODUCTIVE COURSE IN BEGINNING AND ADVANCED BUSINESS MACHINES USING THE INDIVIDUALIZED CONTINUOUS PROGRESS APPROACH.

PART THREE

A COMPREHENSIVE COURSE IN BOOKKEEPING (ACCOUNTING) USING THE INDIVIDUALIZED CONTINUOUS PROGRESS APPROACH.

SUPPORTED BY: Utah State Board of Education Vocational Research and Experimentation Funds, Project No. D-235.

Weber County School District.

INSTRUCTIONS FOR THE TEACHER

Typewriting

These sample packets are not intended to be used as an ideal method of instruction for every classroom. Each situation would demand some type of modification to meet the needs of scheduling, students, and text material available. Most of these packets were developed from the text, 20th Century Typing, 9th Edition, by Lessenberry, Crawford, and Erickson. The packets are developed in four stages. They are:

STAGE I: TECHNIQUES OF TYPEWRITING. This packet covers approximately nine weeks of instruction. The class period should be no longer than 45 minutes and the students should meet daily.

This stage covers the keyboard introduction and a few simple centering problems. After the teacher makes a short introduction of the lesson the students are then instructed by a commercial tape that corresponds with the lesson. This frees the instructor to work individually with those students who might be having difficulty with techniques. Transparencies are also used to aid the student in correct finger positions and posture.

The papers are turned in daily; however, no letter grade evaluation is made on them. The instructor may look at each paper to help him determine which students need more individual help the following day.

If the classroom has been wired for multiple channeling, the

instructor may want to take those students that seem to be learning at a slower pace and have them go through some lessons twice.

- - - - -

The student has to make a choice at the completion of Stage I. He must decide if he wants to take Stage II A, Accuracy and Speed Building, which would prepare him for Stage III, Business Type, or if he wants to take Stage II B, Personal Type.

STAGE II A - ACCURACY AND SPEED BUILDING, The students in this stage should have a 45 minute class period and meet four or five days a week. The number of days would depend on the schedule.

The instructor will now have at least two groups of students in the classroom. To free the instructor to spend some time with the students in Stage II B, drills for speed and accuracy may be put on tape for the Stage II A students. Drills that have been put on transparencies are also good to use with these students.

At least one day a week and preferrably two days should be teacher directed drills and timed tests. The tests should be 5 minute test and the students should keep a personal chart of total speed and errors so he will always be aware of his increase.

The student would be kept in this stage until he reaches a given increase in speed, approximately 10 wpm above his speed at the completion of Stage I, and a maximum number of errors of approximately no more than seven errors on a five minute timing.

- - - - -

STAGE II B - PERSONAL TYPE. This packet has been designed for the students to meet daily for one hour for approximately nine weeks.

15910

The students work at their own pace on this packet. Some may be able to finish before the nine weeks, some may take longer. No credit is given until completion. Guidelines should be set so they will know approximately where they should be in the packet at certain times through the term.

The jobs are brought to the instructor as each one is completed so the instructor can look at it with the student. If there has been an error in placement it can be brought to the students attention at that time. If the instructor feels the job should be redone the student can be told at that time.

Individual jobs are not given a letter grade. The students are graded on the production tests and three minute timed writing tests. One day a week should be used for drill and timings.

Transparencies are available to help the stedents in understanding how to set up letters and forms.

- - - - -

STAGE III - BUSINESS TYPE. This packet has been broken into eight units which the student should be able to complete in 80 to 100 hours of typewriting. The time would depend on the skill the student has when entering the stage. It is suggested that the student be given four days a week to work on production packets, and the fifth day be spent on teacher directed drill and 5 minute timed writings. Those students who work ahead on the production packets may be released one day a week if the schools schedule will allow it. The instructor may want to give a mini-test on the fifth day along with drills. This would consist of a short production problem that all students have covered. It would be timed and then class discussion would be held to

15911

go over all points. The student would correct his own work. No grade would be given, however, all papers would be handed in. The problem might be put on a transparency so all students could look at the correct form while it is being discussed.

RELATED INSTRUCTION

SCHOOL: PETERSBURG, VIRGINIA FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII, POWER FLOW

MILESTONE: V. DRIVE SHAFTS AND UNIVERSAL JOINTS

PERFORMANCE OBJECTIVE NO: 5 TITLE: Remove Drive Shaft, Remove, Test, and Replace Universal Joint, Replace Drive Shaft

CONDITIONS:

Student will learn the related information listed below

LEARN	REFERENCE	SOURCE
1. Drive shafts and universal joints	1. Automotive Mechanics, by Crouse. pp. 502 through 507 Automotive Transmissions and Power Trains, by Crouse. pp. 557 through 566 Automotive Chassis Workbook, by Crouse. Job 11	1. Related Information Class
2. "Repacking a Universal"	2. Continuous film loop	2. Resource Materials Center
3. "Completeing the Transmission od Power"	3. Filmstrip	3. Resource Materials Center
4. Drive shafts	4. Teaching Machine cards 19A, 19B	4. Teaching Machine (Shop)

TECHNIQUES OF TYPEWRITING.

TYPING STAGE I

Performance Criteria

At the completion of this stage you will be able to type at the rate of 20 words a minute or more with an accuracy limit of no more than two errors per minute. You will be able to correctly set up and type a centering problem.

1. The speed and accuracy rate given above must be reached on at least three 3-minute timings before credit can be earned.
2. The centering problems must be satisfactorily completed before credit can be earned.
3. You will be given two objective tests to determine your knowledge of machine parts and spacing rules. To receive credit for these tests you must receive a score of 75% or higher. If you do not receive a score of 75% or higher you will be required to have a conference with your instructor to do additional assignments, and to take another test. A typewritten test will be given as the last assignment in this packet. It will consist of three vertical and horizontal centering problems. A time limit for this test is given on the last page of this packet.

SUPPLIES

You will need the following supplies for this typing stage:

type paper 8½ by 11 inches
folder to keep assignment packets in
pencil and pen

ASSIGNMENTS

All assignments should be identified in the upper right hand corner with the following items:

Name
Date
Lesson Number and class section

15913

1. Listen to and follow the directions given on tape #1. You will learn the control of a few parts of the typewriter (carriage return, cylinder know, carriage release, line space regulator, margin set, paper guide, paper bail, cylinder), correct position of the fingers on the home keys (a,s,d,f,j,k,l,;), and correct stroking of the home keys. If class time remains at the completion of the tape you should continue to practice on 1F page 4.

   Remember
   1. Sit up straight, practice good posture.
   2. Strike the keys with a firm, sharp stroke, and release quickly.
   3. Return the carriage with a wuick wrist and hand motion.
   4. Keep your eyes on the book.
   5. Never strike over a mistake.
   6. At the end of each class period get your work station ready for the next student.

   FORM THESE GOOD HABITS NOW !!!!!

2. Listen to and follow the directions given on tape #2. This lesson will teach you the correct finger reaches for the keys h, e, and Left Shift Key. You should begin to type at a slow and controlled rate. At this point do not be concerned about misstrokes. Continue typewriting with as little interruption as possible and without looking up to check to see if you have or have not typed without error. At the completion of the tape if there is alass time left you will practice on 2E page 6.

3. Listen to and follow the directions given on tape #3. You will learn the correct finger reaches for the letters i, t, and . (period), You will also learn the difference in pica and elite type. Pica type is a larger type and has 10 spaces to the horizontal inch; its centering point is 42. Elite type is a smaller type and has 12 spaces to the horizontal inch; its centering point is 50. (You are typing on an elite machine). The steps in getting ready to type are repeated in slightly briefer form in this lesson, but the activities are essentially the same. Remember, you should never begin to type until you have checked and adjusted the typewriter. While making reaches to new keys be sure to keep a guide finger on the home row to guide you back into position. Notice the spacing rule under 3E.

4. Listen to and follow directions given on tape #4. This lesson will integrate the three previous lessons and give you more time to practice on the keys that have been presented. You should read carefully section 4B of this lesson. It has information that you must know to complete this stage. If time remains at the end of the tape you should practice on 4F page 10. This instruction will not

15913
15914

be repeated. Your instructor expects you, at the end of each tape, to find a section in your book that you need practice on and type until the end of the period.

5. Listen to and follow instructions for tape #5. In this lesson you will learn the reaches for the keys u, c, and Right Shift Key. Remember to always have a guide finger in home position to guide you back into position. Strike all keys without looking at your fingers or keyboard. Notice the new spacing rule in 5C.

6. Double letters often become speed traps for typists who are trying to increase their stroking rate. On the manual typewriter, double letters can be typed in "half time," that is, without lifting the finger enough for the key to return to its normal position before typing it the second time. Instead, two short and quick strokes will give the double letters without producing jerky or spasmodic stroking if the typing is done in rhythm--but not with the same time lapse between all strokes.

7. Follow the instrutions on the previous page for lessons 6 through 11. Learn to backspace and tabulate without taking your eyes from the books.

8. Listen to and follow instructions given on tape #12. Your best timing on section 12D will be recorded. At the end of the tape you will be given a 25 point objective test. This test will cover the machine parts taught to this point, the spacing rules, and the difference in pica and elite type. You will be given 15 minutes for this test.

9. Listen to and follow instructions given on tapes 13-20. There will be no new keys introduced in these lessons. You will improve typing motion and build continuity in typewriting. You will learn how to proofread. You should look for the following types of errors; failing to space, omitted letter, period for comma, faulty spacing, omitted word, strike over, misstrokes, transposition, added letter. Count only one error per word; circle the entire word. Your 3-minute timings will be recorded.

10. Listen to and follow instructions given on tapes #21-30. These lessons will teach you the proper finger reaches for the fingers with as much ease as you do the alphabet. Remember to keep your eyes on the copy when typing the alphabet and figures.

11. You will take two 3-minute speed tests and a 50 point objective test. You will be given 25 minutes for this test.

12. Each day after you have checked your machine you will have a 5-minute warmup practice on the section that will be on the board. These warm-ups will be handed in each Friday.

15916 15915

13. Study and type 35B. These are the steps in adjusting your machine for typing a line in centered form. You will always follow these steps before typing a horizontally centered problem. On the same paper, but below 35B you will type 35C. This is a drill on horizontaly centering. If you have any questions on this drill be sure to get help from your instructor before going on.

14. Complete the problem 35D. Bring the problem to your instructor for approval. After approval complete 35E.

15. Do problem 37B. You underscore with the shift of the 6 key.

16. Follow directions and type problems 36D and 37C. These will be done on separate half sheets of paper. The letters 'TS' mean to triple space. To do this you will return the carriage three times. This will leave two blank spaces between lines of writing.

17. Do drills 37E and 38B on drill paper.

18. Do problem 38C. Follow directions carefully. Notice the spacing at different points of the problem

19. Read and follow the directions for 38D. Follow the rules step by step and you should have no problems. If you have difficulty, ask your instructor for assistance before going on to the next assignment.

20. Do problem 39B and 39C. The steps for vertical centering are given in 38D.

21. Do problems 39D and 40D.

22. Type drill 38B. This drill is on typing outside the margins. Read your directions carefully before typing.

23. Type the bell cue drill given below. Type at a slow, even pace and listen for the ringing of the bell to know when to return the carriage at the end of the line. (You will not type the copy line for line.) If you are typing a word when the bell rings, complete the word. If the carriage locks before you complete the word, depress the margin release and type the rest of the word. Type once using a 50 space line, Double Space, type again on a 70 space line.

Most typing paper is 11 inches long. We count 6 lines to the inch, so a full-size sheet of paper has 66 lines. A half sheet is 5½ inches long and has 33 lines. To have the top margin exactly 1½ inches (9 lines), space down 10 times from the top of the page to type on the tenth line, leaving 9 lines for a top margin.

15916

24. You will take three 1-minute speed tests, three 2-minute speed tests, and three 3-minute tests.

25. You will complete three centering problems for test III. Ask your instructor for a rough draft of the problems you are to complete. If these problems are not completed satisfactorily, you will be given additional ones to practice on, and then will be given another test.

Evaluation

It is recommended this stage be completed by the end of one term, however, more time will be given if needed to reach the standards set for stage one.

The following grading scale will be used for the speed grade for stage one:

20-24 C
25-29 B
30-up A

Centering problems will be graded as follows:

0 errors	A
1-2 errors	B
3-4 errors	C
5 or more	redo the problem
strike over	redo the problem

Errors that will be marked are: Improper form or style, misspelled words, transposed words, improper margins, failure to capitalize correctly, and improper punctuation.

Test III Time Limit:

31-35 mins.	C
26-30 mins	B
25-under	A

15917

PERSONAL TYPE
Stage 11 - B

This course is designed for the student who intends to use type only for his personal use and as an aid in college.

Performance Criteria

At the completion of this course the student will be typing at a minimum rate of 30 words a minute, and will have an accuracy rate of no more than 1 error per minute. He will also have the knowledge to type for his own personal use: announcements, memorandums, postal cards, letters, reports, manuscripts, and personal data sheets.

1. The speed and accuracy rate must be reached on at least three 3-minute timed writings.
2. All production problems must be completed and approved by your instructor. If a problem is not approved it must be retyped.
3. You will be given two type tests. You must accurately complete at least 80% of these tests in order to receive credit for them. If you do not complete 80% of the test you will be given additional assignments, and will be given another test. The first test will consist of a memorandum, an announcement, a postal card, and two letters. A maximum of 45 minutes will be given for this test. The second test will contain a table with columnar heads, a manuscript with footnotes, and a title page. You will be given 40 minutes for this test.

Supplies

You will need the following supplies for this stage:

Type paper 8½ by 11 inches
folder to keep the assignment packet in
pencil or pen
type eraser
carbon paper.

1. You will type from the test job 53C page 90, and job 54C page 92. Study carefully the correction symbols given in these jobs. Many times in typing you will need to type a copy of your material, correct it with pen or pencil (this is called a rough draft), and then type your corrected copy as your final draft. You will use symbols in your rough draft.

15918

2. Type the rough draft on page 1A of this packet.

3. Compose a half page article at the typewriter entitled "My Future Plans". Mark any errors with proofreaders marks, and type a corrected final draft. Turn both copies in.

Typing From Script

4. In your personal typing you will often have to type from a copy that is written in pencil or pen. This is called typing from script. Do jobs 31D, 32B, and 34D group 3.

5. Write a half page article using the title "No Man Is An Island". Type a final copy from the script copy. Turn both copies in.

Erasing

6. The errors that you make in themes, personal notes, and other papers you wish to use should be corrected. You must, therefore, learn how to erase typing errors. The instructions for erasing typing errors correctly are given in the problem on page 1B of this packet. Always follow these procedures when erasing. You will be told in each assignment if you are to erase and correct errors. Type the paragraph outline on page 1B. Single space the lines of the paragraph. Be sure to align the Roman numerals at the right. Use the margin-release key and backspace to the desired point. Use a 60 space line.

Typing Announcements

7. Follow the directions and type 41B and 42C. Correct errors.

Number and Capitalization Guides

8. Do 86C and 87C. This will be returned to you for your personal reference. Erase and correct errors.

9. Do 91B, 92D, 93C, 95B. This will be returned to you for your personal reference. Erase and correct errors.

Typing Memorandums

10. Type job 44C problem 1. The information given in this problem will aid you in a future assignment when typing postal cards.

11. Type the two memorandums on page 1C of this packet. They are each to be typed (1) on a half sheet of paper, (2) with a 70 space line, (3) with SS, but DS between paragraphs, (4) with a 1 inch top margin, (5) with 3 blank spaces after the date. Erase and correct errors. Personal titles (Mr., Mrs., Dr., etc.), salutations, complimentary close, and formal signature are omitted.

Typing Postal Cards

12. Ask your instructor for two postal cards. Type job 44C problem 2.

13. Ask your instructor for a postal card. Type the problem on page 1D of this packet. Erase and correct errors.

Personal letters.

14. Type 50C problem 1 and 2. This is a personal business letter typed in modified block style with mixed punctuation. In a modified block style letter the return address, date, complimentary close, and writer's name are typed at the horizontal center of the paper; the other letter parts begin at the left margin. With mixed punctuation a colon follows the salutation and a comma follows the complimentary close. There is an example on page 2A of this packet. Erase and correct errors.

15. Type job 51B problem 1 and 52C. If you have any difficulty setting these letters up refer to page 2A of this packet. Notice in problem 2 of 52C the inside address is omitted. Erase and correct errors.

16. Another letter style that is common is the block style. This letter style has all letter parts starting at the left margin. There is also another punctuation that is often used. Open punctuation means that there is no punctuation after the salutation and complimentary close. There is an example on page 2B of this packet. Type the letters on page 1E and 1F of this packet. These are to be typed in block style, open punctuation, 50 space line, and with the date on line 15. Erase and correct errors.

17. In all our letters we have had 3 blank spaces between the date and the inside address. To make your letter appear more evenly spaced on the sheet of paper you may want to type it as the example on page 2C of this packet. Type the letter on page 1G in modified block style, open punctuation, using a 50 space line, and the vertical spacing given in example 2C. Erase and correct errors.

18. On page 2D of this packet you will find an example of a letter typed on a half sheet of paper, 5½ by 8½, and in modified block style with indented paragraphs. Study this example and type the letter on page 1H (1) on paper 5½ by 8½. (2) Use a 40 space line Start the return address on line 10. Leave three blank spaces after the date. (3) Indent the paragraphs 5 spaces. Erase and correct errors.

15920

19. "It is often desirable to make one or more copies of the material you are preparing. To make carbon copies, place the carbon paper, with the glossy side down, on a sheet of plain paper. The paper on which you will prepare the original is then laid on top of the carbon paper, and all the sheets are inserted into the typewriter. The dull surface of the carbon sheet should be toward you when the sheets have been rolled into proper position for typing.

When you wish to erase carbon copies, turn the sheets up a few spaces and move the carriage either to the right or to the left so that eraser crumbs will not fall into the machine. Place a small card between the original copy and the carbon sheet, directly under the letter or word to be erased. Make the erasure on the original.

Remove the card, pull the original copy and carbon sheet forward, and then erase on the carbon copy. If you are making more than one carbon copy, use the small card in the manner directed above on all copies except the last to keep from smudging the copies."

Retype assignment 15 preparing one carbon for each letter. Erase and correct errors.

20. You will ask your instructor for test I. You will be given 45 minutes to type a memorandum, an announcement, a postal card, and two letters. Correct all errors.

21. Review the rules for centering in jobs 35C and 38D. Do the problem on page II of this packet. Center the problem vertically on a half sheet of paper. Leave 6 blank spaces between columns. Single space the entries in each column. Triple-space after the heading.

22. Do drill 164B. Do problem 164C problem 1 and 2. Correct errors

23. Do drill 43E and 44D. Do problem 165C. Correct errors.

24. Type 165C problem 2 and 3

Manuscripts

25. Do job 65C problem 1 and 77D problem 1.

26. Do job 68D and 74C problem 2.

27. Do job 91D, 92C, 93D, 94C, and 98C. The three problems in 98C will be inserted into job 94C in the proper places and they will be stapled together. Erase and correct errors.

15921

28. You will take test II. You should be able to type a table with columnar heads, a manuscript with footnotes, and a title page.

Evaluation

The grading scale for speed and accuracy will be as follows:

27-30 C
31-34 B
35 up A

Your problems that are to be corrected will be graded as follows:

C errors - A
If the problem has any errors - redo
redo until correct - C

15922 12521

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: V. DRIVE SHAFTS AND UNIVERSAL JOINTS

PERFORMANCE OBJECTIVE NO.: 5 TITLE: Remove Drive Shaft; Remove, Test, and Replace Universal, Replace Shaft

CONDITIONS:

This assignment is to be performed on a complete automobile

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Position hoist arms and raise automobile to a comfortable working height
6. Remove drive shaft
7. Disassemble universal joint following all steps as outlined in the manual
8. Make all tests and checks as outlined in the manual
9. Reassemble universal joint following all steps as outlined in the manual
10. Make bench tests and checks as outlined in the manual
11. If all tests and checks are satisfactory, install drive shaft in autobile

PERFORMANCE CRITERIA:

PERSONAL TYPE
Stage II B
1 A Page 6

ROUGH DRAFT

all caps → FLARE for wit

Triple Space →

There are but two kinds of clever people in this world.. one group thinks of a ~~smark~~ witty remark in time to make it, and the other in time not to make it.

Genuine ~~True~~ wit is an art all right. It comes from saying the unexpected at the right time to the right people. Learn how to use it.

The next ~~thing~~ best to being witty yourself is ~~to be~~ being able to quote another's wit. Never be clever, though, ~~with~~ at the expense of someone else. This is always poor in taste.

15923

ERASING PROCEDURES

I. Move the carriage to the extreme right or left so that the eraser particles will not fall into the typewriter.

II. If the error occurs on the upper portion of your paper, roll the paper up two or three spaces to give yourself working room. If the erasure is to be made on the lower third of the paper, turn the cylinder backward to keep the paper from slipping.

III. When you erase, be sure that your hands and the eraser are clean to prevent smudges on the copy. An eraser shield is sometimes used to protect the writing that is not to be erased.

IV. Hold the paper firmly against the cylinder with your finger tips. Erase the error carefully so as not to make a hole in the paper. Brush or blow the eraser particles away from the typewriter.

V. Return the paper to typing position. Make the correction by striking the keys lightly. Restrike the letters, if necessary, to make the stroking even.

15924

1. MEMORANDUM IN ARRANGED COPY

Current date

TO: Typing Students

FROM: Procedures Committee

SUBJECT: Horizontal Centering

Centering headings and other typed materials so that there will be equal left and right margins is called horizontal centering.

The first step in centering material horizontally is that of checking the placement of the paper quide. Then, move the carriage to the center point of the paper.

The last step is to backspace once for each 2 spaces in the line to be centered. If one letter remains, disregard it. Begin to type at the point where the backspacing is completed.

- - - -

2. MEMORANDUM IN UNARRANGED COPY

Current date TO: John R. Douglas
FROM: Ronald E. Karleen SUBJECT:
Kayser Project
Congratulations to you and to the men in your department ofr developing an excellent program for use in the Kayser Project. I have just learned that the State Department has authorized an additional $750,000 for use in this project.

When including this addition the budget, be sure to follow the procedures outlined by the State Dept. Call Tom Oliver for further instructions. He has all the necessary forms that need to be completed.

15925

POSTAL CARD

(current date)

Dear Ted

At last we are settled in our Tucson home. Our address is
10293 Glen Arden Drive
and I hope you will write me soon and often. You know how much I miss you and other friends "back home". Tucson is a wonderful place, but it isn't home to me--yet!

Affectionately

(sign your own name)

Address the postal card to:

Linda Swenson

Sioux City, Iowa 51104
December 20, 19--

3 blank

Mr. Thomas J. Briggs
West High School
6809 Franklin Blvd.
Cleveland, Ohio 44102

DS

Dear Mr. Briggs

DS

If you have several competent typists who are ready for office work, ask them to call for an interview with me.

DS

Before the interview, each applicant should complete an application form in ink. If the writing is neat and legible, I am impressed. If it has "messy" corrections, I am prejudiced against the applicant even before the interview is begun.

DS

Our Employment Test includes English, spelling, arithmetic, and typewriting. Competence in these areas is necessary, but we consider attitudes just as important as aptitudes and use the job interview to evaluate the applicant's attitudes.

DS

We expect to have two or three positions open for beginning office workers early next month.

DS

Sincerely yours,

3 blank

Albert N. Tomasson
Personal Director

BLOCK STYLE WITH OPEN PUNCTUATION

260 Ridge Road Cleveland, Ohio 44102 June 24, 19--
Mr. Thomas J. Briggs Business Teacher West High
School Cleveland, Ohio 44102 Dear Mr. Briggs
Now I know how unprepared I was for the job interview
you sent me on a few days ago. I hadn't given enough
thought to my real interests and even less to my job
competence.
I didn't have my social security card or number. Because
I didn't have these with me for the interview, I was
at a disadvantage from the start.
The test went fairly well, I thing; but I need to
review my English, spelling, and arithmetic and must
practice my typing before another interview. I'll do
this, too.
I won't let you down when I go for the next interview,
I promise. Sincerely Earle Caldwell

Mr. Lloyd Bartholome 141 Bedford Court Mansions Adeline Place
London, W.C. 1, England

Dear Mr. Bartholome

It was a great pleasure for me to meet you during my recent visit to London, and I would like to express my sincere thanks for your warm and generous hospitality.

I greatly enjoyed our evening at the Paladium. The convivial company, delightful music, and entertainment brought back pleasant memories of previous visits to your city.

Please extend my kindest regards to Mrs. Bartholome Sincerely

Mr. John C. Gibson 3059 Mapleview Drive Frankfort, Kentucky 40601

Dear Mr. Gibson I am genuinely pleased to be able to write to you that arrangements have been made to offer Tchaikovsky's The Nutcracker Ballet during the coming Christmas Season. Three evening performances will be offered during the week of December 26.

The production has been completely redesigned; striking new sets and decor with add immeasurably to the dazzling impression. All the young at heart, from seven to seventy, will want to see and hear The Nutcracker Ballet !!

Next week, I shall be mailing your complimentary tickets.

Very cordially yours, Lawrence L. Davis, General Manager

BUSINESS TYPE
Stage III

This course is for the student who intends to futher his education in business or use typewriting as a means of employment.

PERFORMANCE CRITERIA

At the completion of this course the student will be able to type at a minimum speed of 40 words a minute with an accuracy rate of no more than 1 error per minute on a 5-minute timed writing. The student will have the knowledge to correctly type business correspondence in the form of postal cards, tables, memos, letters, office forms outlines manuscripts footnotes and bibliographies.

1. The speed rate must be reached on at least three 5-minute timed writings.
2. All production work must be completed and corrected if you directed to correct it.
3. All tests must be completed correctly in the alloted time before credit can be earned.

SUPPLIES

You will need the following supplies for this stage.

type paper 8½ by 11 inches
folder to keep your assignment packet in
type eraser
carbon paper
pen or pencil

EVALUATION

The following scale will be used for your speed and accuracy grade.

1st term		2nd term	
35-39	C	40-44	C
40-44	B	45-49	B
45-up	A	50-up	A

Each production test will be graded according to the scale on each individua

15936

STAGE III UNIT 1
ROUGH DRAFT AND SCRIPT

ASSIGNMENTS

1. You will type from the text job 53C page 90, and job 54C page 92. Study carefully the correction symbols given in these jobs. Many times you will need to type a copy of your material correct it with pen or pencil (this is called a rough draft), and then retype from your corrected copy for your final draft. You will use the symbols in these jobs in your rough draft.

2 You may often have to type from a copy that is written in pencil or pen. This is called typing from script. Do three times each, jobs 31D and 32B.

3. Ask your instructor for unit sheet 2. Give your instructor unit sheet 1.

12938
15937

STAGE III -- UNIT 2
ANNOUNCEMENTS & NOTES

ASSIGNMENTS

1 Type job 41B. Follow your spacing directions very carefully. Remember that the letters TS mean to triple space or return the carriage 3 times leaving 2 blank spaces. The letters DS mean to double space or return the carriage twice, leaving 1 blank space. Review pages 61 and 66 for centering rules.

2 Do drill 41C on centering on special size paper. If you do not throughly understand this drill ask your instructor for assistance.

3. Type job 42C. In this job you are taught what mixed punctuation is. Remember this for all future correspondence. Mixed punctuation means that a colon is typed after the salutation and a comma is typed after the complimentary close.

4 Type job 43D. The red lines indicate where the carriage should be returned.

5 Do drill 43E. Ask your instructor for assistance in this drill if you are unable to draw the line and type on it properly.

6 Type job 47D problems 1 and 2.

7 Ask your instructor for unit 3. Give your instructor unit sheet 2.

15938
15937

STAGE III - UNIT 3
POSTAL CARDS

ASSIGNMENTS

1. Read job 44C problem 1. You need to remember the dimensions given in this job when typing postal cards.

2. Ask your instructor for two postal cards. Type job 44C problems 2 and 3.

3. Do drill 44D. Get assistance from your instructor if you need it.

4. Type job 45D. Ask your instructor for 2 postal cards.

5. Do drill 45E. Follow directions carefully. If you need assistance ask your instructor.

6. Type job 47D problem 3. Ask your instructor for 1 postal card.

7. Ask your instructor for type test 1. You will be given an announcement, a personal note and a postal card in unarranged form. You will be required to set these problems up and type them in correct form in 30 minutes or less. The grading scale for this test will be as follows

Time Limit		Error Limit	
26 30 min. typing time	C	3-4 errors per problem	C
21-25 min. typing time	B	1-2 errors per problem	B
20 or less	A	0 errors per problem	A

15939

TYPING STAGE III - UNIT 4
LETTERS

ASSIGNMENT

1. Type job 50C problems 1 and 2. Notice what is meant by modified block style and mixed punctuation.

2. Type job 51B problems 1 and 3.

3. Type job 52C problems 1 and 2.

4. Type job 53B. This is a business letter and has no return address. It has a typed signature as well as a hand written signature and reference initials. Leave 3 blank spaces between the complimentary close and the typed signature to allow room for the handwritten signature. You will always put reference initials on business letters typed in this class unless you compose the business letter and put your name as the signature. By reference initials we mean your first and last initial (no periods after initials) placed usually a DS below the closing lines and at the left margin.

5. Read the top of page 91 on carbon copies.

6. Type job 54B.

7. Ask your instructor for 3 small envelopes and 3 large envelopes. Address these envelopes using the addresses given at the bottom of page 93. Three line addresses should be double spaces and four or more line addresses should be single spaced. Start the address 5 spaces from the left of the center of the envelope and on line 12 from the top of a small envelope and line 13 from the top of the large envelopes. Return addresses are always single spaced and placed on the second or third line from the top and on the second space from the left edge of the envelope.

8 Ask your instructor for letter test 2. You will be given three letters which you will be required to correctly set up and type in 30 min. or less. The letters will be modified block style with mixed punctuation, and each will have an envelope to be addressed.

9. Do drill 60D. A grade students erase properly. For all other assignments in this unit and future units you will erase errors and correct them if you are directed to do so in your instructions.

15940

STAGE III UNIT 4 cont.

10 Read the top of page 162 on business letter placement. You may need to refer back to this table for future assignments.

11 Type job 101D.

12. Type job 102C, letter 1. Correct errors.

13. Type job 104C, problems 1 and 3. correct errors

14 Type job 105C

15. Type job 106D. This is a block style letter all lines start at the left margin. Open punctuation is used no punctuation after the salutation or complimentary close.

16. Type job 109C, problem 1.

17. Type job 203C problem 1 and 2. This is a new style letter the AMS letter. It is a simplified style with no salutation or complimentary close. This style letter is always typed in block style. Read the letter before typing it. It contains information about typing this style letter.

18. Type job 204C problem 1 and 2. This is also a new style letter with inverted paragraphs. Notice that each line of the paragraph is indented 5 spaces except the first. Read the letter before typing it

19. Type job 205C problem 1 and 2. Read the letter before typing it.

20. Ask your instructor for test 3. This test will contain three letters which you will be required to correctly set up and type (correcting all errors) and address an envelope for each letter in 35 minutes or less. Be sure you know what is meant by modified block style, block style, and AMS style letters, and mixed and open punctuation.

21. Ask your instructor for unit sheet 5. Return unit sheet 4 to your instructor.

TYPING STAGE III UNIT 5
TABULATION

1. Do drill 57B. Follow each step carefully. Get help from your instructor if you need it.

2. Type job 57C.

3. Do drill 58B. You will have a DS between the main heading and the secondary heading, and a TS between the secondary heading and the columns.

4. Read vertical Centering Mathematical Method at the top of page 98. Below is an example of this type of centering.

33 no. of lines available
-12 no. of lines needed
21

10 Top margin
2/21

5. Do drill 59B. Remember to space once after each letter and three times after each word on a spread heading.

6. Type job 59C. If you have difficulty remembering what the proofreaders marks mean turn back to pages 90 and 92. Correct errors.

7. Do drill 60B.

8. Type job 60C. Notice that you have a new proofreaders mark. Correct errors.

9. Type job 61C. You will have a DS before and after the tabulation problem in the letter.

10. Type job 64C problems 1 and 2. Correct errors.

11. Read job 114C. This will give you information on the Backspace from Center method of tabulating. You will use this method in future problems.

12. Type jobs 114D 116C 117C, and 119 problems 1 and 3.

14071
15942

STAGE III -- UNIT 5 cont.

13. Type job 120D problems 1 and 2. Read at the bottom of the page about LEADERS. Ask your instructor for help in typing leaders if you need assistance.

14. Type job 121C.

15 Ask your instructor for Test 4 . This test will contain three tabulation problems which you will be required to correctly set up and type (correcting errors) in 30 minutes or less.

16. Ask your instructor for unit sheet 6. Return unit sheet 5 to your instructor.

STAGE III - UNIT 6
OFFICE FORMS

ASSIGNMENTS

1. Type job 126E, problems 1 through 14. Study each illustration carefully and space your problems as shown in the illustrations. Ask your instructor for printed forms for these problems. Problem 11 is to be timed for 3 minutes. Ask your instructor to time you. Correct errors.

2. Type job 134D. Ask your instructor for a form.

3. Do drill 138D.

4. Type job 140C. You will be given another itinerary to type in a future job so pay close attention to the spacing of this one.

5. Type job 186C problems 1 and 2. Ask your instructor for 2 bill of lading forms.

6. Type job 219D problem 1. There should be 2 blank spaces between the two vertical columns of figures.

7. Ask your instructor for test 5. This test will contain a memo, a telegram, an invoice, a voucher check, and a bill of lading which you will be required to correctly set up and type (correcting errors) in 45 minutes or less.

8. Ask your instructor for unit sheet 7. Return unit sheet 6 to your instructor.

159407

STAGE III - UNIT 7
OUTLINES, MANUSCRIPTS, & REPORTS

1. Type job 65C. Note the two sentences above this job. They explain the spacing rules for outlines and how to set your tab. There will be two blank spaces after the period following the Roman numeral letters and numbers.

2. Do drill 65E.

3. Type job 66D problem 1. Every letter that is underscored three times should be capitalized.

4. Ask your instructor to aid you in the use of a page line gauge 66E.

5. Do drill 67D.

6. Type jobs 68C and 68D. Use your page line gauge for these jobs. Notice that your footnotes are single spaced with a double space between footnotes.

7. Ask your instructor for test 6. You will be required to type a one-page manuscript with footnotes, and one outline which will be given to you in rough draft form, one letter, and one tabulated item. You will be given 45 minutes to complete the test and correct all errors.

8. Type job 91D and 92C. Correct errors.

9. Type job 94C and 98C. These two problems will be bound together at the left. Allow correct margins for this. Correct errors.

10. Type job 217D - an unbound manuscript.

11. Type job 218D a topbound manuscript.

12. Ask your instructor for test 7. You will be required to type a one page leftbound manuscript, a one page topbound manuscript and a one page unbound manuscript. You will be required to know the margins for each different manuscript, and to correct all errors. You will be given 35 minutes for this test.

13. Ask your instructor for unit sheet 8. Return unit sheet 7 to your instructor.

15945

STAGE III - UNIT 8
JOB TYPING

No test will be given for this unit. Instead, you will receive a grade on each assignment. You will keep all the jobs for one assignment until they are all completed, then you will turn the entire assignment in at once. Each job should be turned in without error. Neat erasers are acceptable on all jobs except those mentioned in the last assignment.

ASSIGNMENTS

1 EMPLOYMENT APPLICATION- Type job 146C. When you type problem 3 make sure each statement about yourself is true.

2. TYPING IN A GENERAL SERVICE OFFICE- Type the 7 jobs found in applied typing lessons 252-256. For job 3 you will be required to type letters to the people holding index cards #191, 192, 197 and 198 only.

3. TYPING IN A SALES DEPARTMENT Type the following jobs found in lessons 258-263. Jobs 1,4,5,6,7 (letters 1 & 5) and 8 (letters 1,3,5,7)

4. TYPING IN A FINANCIAL DIVISION Type the following jobs found in lessons 265-268 Jobs 1,2,3,4 (only a model copy of each letter) 5 (only one letter- to the first addressee on the list whose account is between 46-60 days past due), 6 (only one letter- to the first addressee on the list whose account is more than 60 days past due), 8, and 9.

5. TYPING IN AN EXECUTIVE OFFICE Type the 7 jobs found in lessons 270-273.

6. TYPING IN A GOVERNMENT OFFICE- Type the following jobs found in lessons 277-280 Jobs 1,2 and 4.

7. TYPING IN A LEGAL OFFICE Type the following jobs found in lessons 282-285 Jobs 1 2 4 (put the endorsement on the back of job 2) and 6. No erasers are allowed on jobs 1 2 and 4. Everything must be perfect on these three jobs.

15946

TO THE INSTRUCTOR

The following individualized procedures are used in connection with the 20th Century Bookkeeping and Accounting, 23d edition, First-Year Course by Boynton - Carlson - Forkner - Swanson.

Work sheets and instructions are issued by the instructor or the Lab Assistant. The student works at his own rate of progress, checking the completed materials into his personal file folder which is evaluated to meet his needs or/and periodically with him.

Major emphasis is placed on performance of the learner his neatness accuracy amount of work completed by outlined completion dates. Detailed instructions are found on the pages that follow.

15947

PERFORMANCE CRITERIA:

At the end of each unit, the student must have completed all of the assigned work and application problems. These problems are to be completed with neatness--error corrections are acceptable if done in the prescribed manner. Errors made in the assigned problems will be classified as major*1 and minor. *2Minor errors will not reduce points allowable on the assignment unless there are too many.

1. All assignments must be completed before being evaluated.
2. The completed work will be graded as follows:
   a. Three points will be awarded the assignment if there are no errors made.
   b. Two points will be awarded if there are no more than five minor errors or one major error.
   c. One point will be awarded if there are no more than ten minor errors or two major errors.
   d. No points will be given for those assignments with eleven or more minor errors or three major errors.
   e. Students doing the bonus assignments will receive one point for doing the work and two points if the assignment is correct.
3. Quizes are given after each unit of work. Up to ten points are given for each quiz.
4. Tests will be given periodically with a possible score of 100 pts.
5. Quiz, test, and assignment scores are added together and divided by the total number possible to arrive at a grade. Grades will be determined as follows:

   A - 93-100%
   B - 85-92%
   C - 75-84%

*1 Major errors are classified as:
   a. leaving out journal entries
   b. an addition or subtracting error
   c. totals not balancing
   d. entries not posted correctly
   e. improper closing of ledgers
   f. inaccurate reports.

15948

THE COURSE WILL CONSIST OF THE FOLLOWING UNITS:

1. Starting a bookkeeping system.
2. Debits and credits of business transactions.
3. Journalizing, posting and proving accuracy by trial balance .
4. Six column work sheet.
5. Preparing income statement and balance sheet.
6. Closing the ledger.
7. Buying and selling merchandise on account; and payment and receipts of cash.
8. Keeping a checking account and reconciliation of the bank statement.
9. Completing an eight column work sheet.
10. a. Preparing financial reports for business.
    b. Recording and posting of adjusting and closing entries.
11. Completing the business cycle using the five special journals.
12. The combination journal.
13. Sales and purchase returns.
14. Payroll records, taxes, and reports; depreciation and disposing of fixed assets and bad debts.
15. Special bookkeeping cycle.
16. Introduction to data processing.

15049

UNIT I

OBJECTIVE:

At the end of this unit the student will know how to open the books of a business by preparing the beginning balance sheet, recording the opening entry, and posting to the general ledger.

ASSIGNMENT I

a. Read material in text, pages 3-9
b. Do study questions, page 10 and Cases 1,2, and 4, pages 10-11
c. Complete Drill 1-A and 1-B, Workbook page 3
d. Complete problems 1-1, 1-2, and 1-B, Workbook pages 3-4
e. Extra credit 1-S and Study Guide
(Optional for extra credit)

If the extra credit problems are done, forms will have to be made by the individual student.

Self Checking after completing the assignment; check the accuracy and the completeness of the work by asking these questions:

1. Is each of the three items in the heading centered on each line?

2. Is the heading of each section centered within the body of the balance sheet?

3. Are the assets, liabilities, and proprietorship listed immediately below the appropriate heading without skipping a line?

4. Is there a blank line between the Liabilities section and the Proprietorship section to separate these two sections?

5. Is the amount of the total assets at the bottom of the left-hand side of the balance sheet on the same line as the amount of the total liabilities and proprietorship at the bottom of the right-hand side?

6. Are the two totals at the bottom of the balance sheet the same amounts?

7. Are the single and double lines drawn across the amount columns only?

ASSIGNMENT 2

a. Read text material pages 15-19. Notice particularly the style in which the entry is recorded in the journal.

15950

b. Do Cases 1 and 2, page 20 of text.
c. Complete Study Guide, Workbook pages 5-6.
d. Complete Drill 2-A, Workbook page 7.
e. Complete problems 2-1, 2-2, and 2-B, Workbook pages 7-8
f. Extra credit problem 2-8, text page 23.

Ask for Quiz #1

INSTRUCTIONS: Upon completion of Assignments 1,2, and 3, review the work and study for a quiz. After studying ask for Quiz #1.

When Quiz is completed, request an evaluation conference with the teacher. If the quiz has been passed with 75% or better accuracy, proceed to Unit 2. If, however, the score is less than 75%, supplemental work and a different quiz must be completed.

*This procedure will be followed on all unit work, quizes and tests.

SUPPLEMENTAL ASSIGNMENT I-A

a. Complete problems 1-A, 1-B, page 637.
b. Complete problems 2-A, page 637
c. Complete problems 3-A, page 638.

Make own forms on loose leaf paper.

SUPPLEMENTAL ASSIGNMENT I-B

See attached sheet.

15951

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: VI. DIFFERENTIAL

PERFORMANCE OBJECTIVE NO.: 6 TITLE: Remove, Disassemble, Check, Reassemble, and Replace Differential

CONDITIONS:

This assignment will be performed on a complete automobile.

BEHAVIOR: After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to the appropriate chapter
4. Select proper tools and materials
5. Position hoist lift arms to correct position under the automobile frame
6. Raise automobile to comfortable working height
7. Disconnect parts and accessories required for differential removal following all steps as outlined in the manual
8. Place safety jacks in correct position underneath differential and lower automobile enough to cause safety jacks to support the differential
9. Remove bolts holding differential following all steps as outlined in the manual

PERFORMANCE CRITERIA:

SUPPLEMENTAL ASSIGNMENT
I-B

A. Prepare a balance sheet, dated October 31, current year, for C.N. Harvey. His assets and his liabilities are listed below.

Assets		Liabilities	
Cash	385.00	Allen Grocery	88.00
Automobile	2000.00	Jones Bros.	95.00
Furniture	3748.00	Hansen Dairy	12.00
House	17000.00		

B. Prepare a balance sheet, dated December 31, current year, for Ideal Laundry. M. T. Weber is the proprietor and manager. The assets and the liabilities are:

Assets		Liabilities	
Cash	973.50	J. M. Greens	120.00
Office Equipment	124.60	Hunt Supply Co.	56.80
Delway Equipment	970.00		
Machinery	5304.00		

C. Thomas Bostwick is an attorney with the following business assets and liabilities: Cash, 612.24; Supplies, 37.50; Law Library, 475.00; Office Furniture, 725.00; Office Equipment, 375.00. He owes Avery Book Company 55.25 and Hagan Equipment Company 465.00.

Instructions:
1. Prepare a balance sheet date June 1 of the current year.
2. Record the opening entry in a General Journal.

D. The balance sheet of the Bauman Repair Shop, owned by Merline Bauman, on July 31 of the current year is shown below:

Bauman Repair Shop
Balance Sheet
July 31, 1969

Assets		Liabilities	
Cash	412.00	Jarger Equip.	197.00
Parts	375.00	Davel & Son	32.00
Office Equip.	310.00	Total Liabilities	229.00
Shop Equip.	3500.00	Proprietorship	
		Merlin Bauman, Cap.	4368.00
Total Assets	4597.00	Total Liab. & Prop.	4597.00

Make an opening entry in the journal and post properly to the ledger.

15952

QUIZ I

1. The bookkeeping equation is _____.

2. The business paper from which an opening entry in the journal is made is called a _____.

3. The opening entry is obtained from the _____ and is recorded into the _____.

4. The steps of recording the opening entry in the journal are:
   a.
   b.
   c.
   d.

5. The steps of posting the opening entry to the ledger are:

   a.
   b.
   c.
   d.
   e.

6. Make an opening entry in the journal from the following information and post properly to the ledger.

Bauman Repair Shop
Balance Sheet
July 31, 1969

Assets		Liabilities	
Cash	412.00	Jaeger Equip. Co.	197.00

15953 12324

QUIZ 1-A

1. The term asset is defined as _____;
   Liabilities is _____; and proprietorship is
   _____.

2. If a business' assets are $11,000 and its liabilities totaled $4,500, the proprietorship must be _____.

3. The claims against assets are sometimes called _____.

4. The source document for the opening entry is the _____.

5. Explain the steps in posting from the journal to the ledger.

6. When an error is made in journalizing and posting, the correct way to mak a correction is _____.

7. Make an opening entry in the journal from the following information and post properly to the ledger.

Hilltop Motel
Balance Sheet
August 1, 1969

Assets		Liabilities	
Cash	665.00	Apex Plumbing Co.	300.00
Housekeeping Sup.	650.00	Motel Equip. Co.	1200.00
Furniture & Fixtures	5600.00	Total Liabilities	1500.00
Office Equip.	595.00		
		Proprietorship	
Total Assets	7510.00	Charles Martin, Cap.	6010.00
		Total Liab. & Prop.	7510.00

15954 15923

QUIZ I-B

1. Assets = Liabilities + Proprietorship is the _____ equation.

2. What a business owns is knows as an _____, what is owed is a _____, and what a business is worth is the _____.

3. A source document for an opening entry in the general journal is _____.

4. Equities are claims against _____.

5. The five steps in posting are:
   1.
   2.
   3.
   4.
   5.

6. A diagram that shows all the steps involved in a particular activity or procedure is called a _____.

7. Make an opening entry in the journal and post properly to the ledger.

Roy High School Athletic Department

		Total Liab. & Prop.	4469.00

15955

UNIT 2

OBJECTIVE:

At the end of this unit the student should be able to analize, classify, and place into debit or credit all transactions affecting assets, liabilities, proprietorship, income and expense accounts.

ASSIGNMENT 4

a. Read text material, pages 39-46. Study carefully the T-accounts on page 46.
b. Answer study questions, text page 47.
c. Answer case 2, text page 47.
d. Complete Study Guide, Workbook pages 17-18.
e. Complete Drill 4-A, 4-B, and 4-C, Workbook page 49.
f. Complete problems 4-1, 4-2, 4-3, pages 20-22.
g. Bonus problems 4-S, 4-B, pages 23-24.

Self Checking:

1. What classification of account has its balance side on the debit side?
2. What classifications of accounts have their balance side on the credit side?
3. What classifications of accounts has all increases written on the debit side?
4. What classifications of accounts have all increases written on the credit side?
5. What classifications of accounts have all decreases written on the debit side?
6. What classification of account has all decreases written on the credit side?

Turn work in for evaluation.

ASSIGNMENT 5

a. Read carefully pages 53-58. Notice T-accounts on page 58.
b. Answer Cases 1, 2, 3, 4, text page 59.
c. Complete Study Guide, Workbook pages 25-26.
d. Complete Drill 5-A, 5-B, Workbook page 27.
e. Complete problems 5-1, 5-2, and 5-3, Workbook page 28.
f. Bonus problems 5-3, 5-B, Workbook pages 31-32.

Self Checking:

1. What two classification of account have their balances on the debit side?
2. What three classifications of accounts have their balances on the credit side?

15956

3. What two classification of accounts have each increase recorded on the debit side?

4. What three classifications of accounts have each increase recorded on the credit side?

Turn work in for evaluation.

INSTRUCTIONS: After Assignment 5 has been completed ask the teacher for Quiz 2. Follow instructions at the end of Unit 1.

SUPPLEMENTAL PROBLEM 2-A

a. Complete Appendix problem 4-A, pages 638-639.
b. Complete Appendix problem 5-A, pages 639-640.

SUPPLEMENTAL PROBLEM 2-B.

See attached sheet

1595021

SUPPLEMENTAL PROBLEM 2-B

Mr. Ronald Radtke operates a real estate agency. His ledger contains the following accounts: cash; automobile; office furniture; office machines; office supplies; Holmes Equipment Company; Johnson Supply Company; Ronald Radtke, Capital; Commissions Income; advertising expense; automobile expense; entertainment expense and rent expense.

Analysis each of the following transactions using T-accounts.

1. Received cash, $37.00 for the sale of old office furniture.

2. Paid cash, $50.00 to the Johnson Supply Company in part payment of the amount owed them.

3. Received cash, $60.00 as commission for renting a house.

4. Paid cash, $150.00 for rent of office for November.

5. Paid cash, $10.50 for entertaining a customer.

6. Received cash, $65.00 as commission for serving as agent in securing a tenant for a house.

7. Paid cash, $9.75 for advertising.

8. Paid cash, $7.50 for gas and oil used in operating the automobile on business.

9. Paid cash, $12.25 for gas and oil used in operating the automobile on business.

10. Received cash, $550.00 as commission on the sale of a house.

11. Paid cash, $25.00 for office supplies.

12. Paid cash, $95.00 to Holmes Equipment Company in part payment of amount owed to them.

13. Paid cash, $8.00 for advertising.

14. Paid cash, $225.00 for new typewriter to be used in the business.

15. Received cash, $490.00 as commission on the sale of a house.

16. Paid cash, $100.00 for a new desk.

QUIZ 2

1. The two sides of all ledger accounts consist of _____ and _____.

2. The balance of any asset account is decreased by posting the amount to the _____ side.

3. Any proprietorship account balance is increased on the _____ side.

4. All expense accounts are increased by placing the amount to the_____ side.

5. Income account balance is increased by _____ the account.

6. An increase in proprietorship that results from the operation of the business is called _____. A decrease in proprietorship that results from the operation of a business is called an _____.

7. A liability account is decreased when the amount is placed on the _____ side.

8. The three classifications of accounts that the balances are increased by a credit are _____, _____ and _____.

9. The classifications of accounts that are decreased by a credit are _____ and _____.

QUIZ 2-A

1. Complete the following:

   a. An asset is increased by a _____ and decreased by a _____.

   b. A liability is increased by a _____ and decreased by a _____.

   c. Proprietorship is increased by a _____, and decreased by a _____.

   d. Income is increased by a _____ and decreased by a _____.

   e. Expenses are increased by a _____ and decreased by a _____

2. The classifcation accounts, income and expense, affect the _____ account of the balance sheet.

15959

3. The two accounts with debit balances are _____ and _____.

4. The three accounts with credit balances are _____, _____, and _____.

QUIZ 2-B

1. The debit side of any asset account is the balance on _____ side.

2. All increases in any account are always recorded on the _____ side.

3. The balance side of any liability account is the _____ side.

4. The side opposite the balance side of any liability is the _____ side.

5. The debit side of the Proprietorship account is the _____ side.

6. The increase or balance side of a Proprietorship account is the _____ side.

7. The balance side of any income account is the _____ side.

8. The decrease side of an income account is the _____ side.

9. The classification account, expenses, decreases the _____ account. This is done by _____ the expense account.

15960

UNIT 3

OBJECTIVE:

At the completion of this unit the student will be able to make journal entries, post to the ledger, and prove the accuracy of his journalizing and posting.

ASSIGNMENT 6

a. Read pages 65-78 of text material.
b. Answer questions page 79 of text
c. Complete Study Guide, Workbook pages 33-34
d. Complete Drill 6-B, Workbook page 36
e. Complete problems 6-1, 6-2, and 6-S, Workbooks pages 37-38
f. Extra credit problems, Drill 6-A, Workbook page 35 and problem 6-B, Workbook page 40.

Self Checking - After work is completed ask these questions:

1. Are all transactions recorded in the journal?

2. Does the cash accounts agree with the actual amount in the bank?

3. Do the debit columns equal the credit columns?

4. Were the total amounts of each column footed and proved before writing in large figures?

5. Were double lines drawn under the totals correctly?

INSTRUCTIONS: At this point a 100 point test covering Assignments 1-6 will be taken by the student. If the score is 75% or higher, proceed to Assignment 7. If the score is less than 75% then request from the teacher a special conference where he will review all the material missed on the test. Supplemental work will be given and a supplemental test taken. A score of 75% or greater must be attained before going ahead. Study carefully!

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: VI. DIFFERENTIAL

PERFORMANCE OBJECTIVE NO.: 6 TITLE: Remove, Disassemble, Check, Reassemble, and Replace Differential

CONDITIONS:

BEHAVIOR:

10. Raise automobile cautiously making sure that the differential is resting firmly on the safety stands
11. Remove differential from underneath the automobile
12. Perform all tests and checks as outlined in the manual
13. Disassemble the differential following all steps as outlined in the manual
14. Identify all parts and their functions
15. Perform all tests and checks as outlined in the manual
16. If the tests and checks are satisfactory, reassemble the differential following all steps as outlined in the manual
17. Make final tests, checks, and adjustments following all steps as outlined in the manual
18. Place the differential on safety stands under the automobile and position so that when the automobile is lowered, the differential will align with the support brackets
19. Lower automobile cautiously making necessary adjustments to align differential

PERFORMANCE CRITERIA:

ASSIGNMENT 9

a. Project 1, text pages 117-120 and Workbook pages 59-64

Turn in for evaluation

INSTRUCTIONS· After Assignment 9 is completed ask for Quiz 3. Follow instructions at the end of Unit 1.

SUPPLEMENTAL ASSIGNMENTS 3-A

a. Complete problem 6-A, pages 640-641
b. Complete problem 7-A, pages 642-643
c. Complete problem 8-A, pages 643-644

Turn in for evaluation.

QUIZ 3

1. The source document for all cash received is a _____.

2. The source document for all cash payments is the _____.

3. Double entry bookkeeping is recording the _____ and the _____ of each transaction.

4. The five divisions of most ledgers are 1._____ 2._____ 3._____ 4._____ and 5._____

5. How do you indicate that the totals of the general debit and general credit columns are not posted?

6. If the cash debit column total were $3,249.00, the cash credit total were $762.00, and the beginning balance was $565.00, the amount of cash account balance would be _____.

7. If the totals of the trial balance do not agree but can be divided by 9, this means that the bookkeeper made a _____ error.

15962

QUIZ 3-A

1. A receipt is given to each customer either in the form of a written paper or cash register tape. These items are a source document for all _____.

2. A check stub is a source document for all _____.

3. The five main divisions of most ledgers are: _____, _____, _____, _____, _____.

4. A check mark under the totals in the cash journal indicate that _____.

5. If the cash debit total was $4560.00, cash credit total was $1,620.30, and beginning balance was $780.00, then the cash account balance would be _____. This must agree with the total cash _____.

6. Recording the debit part and the credit part of each transaction is know as the _____ bookkeeping system.

7. A transpassing error can be determined by finding the difference of the trial balance totals and dividing by _____.

QUIZ 3-B

1. The source documents for all cash receipts and cash payments are _____, _____, and _____.

2. What is the cost on hand if the beginning balance was $565.00, cash debit $2,684.00 and cash credit $762.00?

3. Why is a check mark placed in the account title column when journalizing a transaction showing income from gross sales?

4. What is meant by the equality of debits and credits?

5. The five divisions of most ledgers are _____, _____, _____, _____, _____.

6. Why are the individual amounts in the cash debit and cash credit columns not posted?

15963

7. In a cash journal three of the five columns are posted. They are _____, _____ and _____.

8. Proving the accuracy of the ledger is usually done by footing each ledger account and finding the balance, then taking each balance and recording it into a _____.

UNIT 4

OBJECTIVE:

At the completion of this unit the student should be able to complete a six column worksheet and determine if a net income or loss occurred during the fiscal period.

ASSIGNMENT 10

a. Read text material pages 121-125
b. Complete Study Guide, Workbook pages 65-66
c. Do Drill 9-A, Workbook page 67
d. Do problems 9-1 and 9-B, Workbook pages 68, 70
e. Extra Credit problem 9-S, Workbook page 69

Self Checking:

1. Are all accounts listed in numerical order on the worksheet?

2. Were all assets, liabilities, and proprietorship accounts transferred to the balance sheet debit or credit columns?

3. Were all income and expense accounts transferred to the income statement debit or credit columns?

4. Were the words, 'net income' or 'net loss' written in the account titles column?

5. Do the totals of the trial balance equal?

6. After determining net income, was the amount written in the debit column of the income statement and credit column of the balance sheet; or if net loss, a credit in the income statement and debit in the balance sheet?

7. Do the totals of the income statement balance after net income or net loss is added?

8. Do the totals of the balance sheet balance after net income or net loss is added?

Turn in work for evaluation.

15964

INSTRUCTIONS: Ask for Quiz 4 and follow instructions of Unit 1.

SUPPLEMENTAL ASSIGNMENT 4-A

a. Complete problem 9-A, pages 664-665

Turn in for evaluation.

SUPPLEMENTAL ASSIGNMENT 4-B

a. Complete the following problem:

The account balances in the ledger of Bill Stevens an optometrist, on November 30 of the current year, the end of a fiscal period of one month were:

Cash	1,278.45
Automobile	2,950.00
Equipment	5,275.00
Office Furniture	987.10
Baxter Company (creditor)	349.25
Sawyer Optical Supplies (creditor)	95.50
Bill Stevens, capital	9,304.00
Professional Fees	1,304.00
Miscellaneous Expense	34.80
Rent Expense	150.00
Salary Expense	275.00

Turn in for evaluation
Complete a work sheet.

QUIZ 4

1. Complete a work sheet using the following information:

Berry Parcel Service
Work Sheet
for Month Ending June 30, 1969

		dr.	cr.
Cash	11	1,175.60	
Delivery Equipment	12	6,357.00	
Office Equipment	13	822.00	
Edger Gas & Oil Co.	21		1,320.00
Marathon Motors	22		182.50
Carl Berry, Capital	31		5,380.81
Fees Income	41		4,328.50
Heating Expense	51	273.20

Miscellaneous Expense	51	54.80	
Rent Expense	52	200.00	
Salary Expense	53	375.00	
		16,459.25	16,459.25

15987

UNIT 5

&

OBJECTIVE:

At the end of the unit the student should be able to complete an Income Statement and Balance Sheet by using information found on the work sheet.

ASSIGNMENT II

a. Read text material, pages 131-136
b. Study Questions, text page 137
c. Do Drills 10-A and 10-B, Workbook page 73
d. Do problems 10-1, 10-2, 10-S, Workbook
e. Extra credit, Workbook 10-B

Self Checking - Ask yourself these questions:

1. Did you center each line of the heading of your income statement?

2. Did you place the headings of the two sections of the income statement, income and expenses, close to the vertical red line at the left of the wide column?

3. Did you keep an even indention for all the account titles listed on your income statement?

4. Did you rule a double line under the amount of the net income to show completion of the work?

5. Did you center each of the three lines of the heading of your balance sheet?

6. Did you center the heading of each of the three main sections of the balance sheet: Assets, Liabilities, and Proprietorship?

7. Is the amount of the total assets at the bottom of the left-hand side of the balance sheet on the same line as the amount of the total liabilities and proprietorship at the bottom of the right-hand side?

8. Did you neatly rule the double lines across the amount columns only, under the two proving totals of your balance sheet?

Turn in for evaluation.

INSTRUCTIONS: Ask for Quiz 5. Follow instructions of Unit 1.

15968

SUPPLEMENTAL ASSIGNMENT 5-A

Complete problem 10-A, page 645

Turn work in for evaluation.

SUPPLEMENTAL ASSIGNMENT 5-B

See attached sheet

QUIZ 5

1. The report that shows the financial progress of a business over a period of time is _____.

2. The report which shows the financial condition of a business on a specific date is _____.

3. The information for preparing the income and expense sections of the income statement is obtained directly from the _____ and _____ columns of the work sheet.

4. The information used to complete the balance sheet items are obtained from the _____ and _____ columns of the work sheet.

5. If the Proprietor's beginning balance is $3400, the net income is $1300, then the new Proprietorship is _____.

6. Complete an income statement using the following information:

Commissions Income	2012.00
Advertising Expense	122.00
Automobile Expense	36.00
Entertainment Expense	14.00
Rent Expense	135.00

15969

QUIZ 5-A

1. Two financial reports that are taken from the work sheet are the _____ and the _____

2. If the proprietor's beginning balance was $6450.00; the net income for the month was $1700; what would the new proprietorship be?

3. Double lines are ruled under the final totals of each column of a report to indicate that _____.

4. Using the following information, prepare an Income Statement:

Admissions Income	2304.00
Advertising Expense	130.00
Electricity Expense	105.75
Film Rental Expense	925.00
Maintenance Expense	64.00
Projection Expense	33.00
Rent Expense	200.00
Water Expense	35.50

5. From the following information prepare a balance sheet:

Cash	2873.50
Air Conditioning Equip.	3375.00
Projection Equipment	8900.00
Sound Equipment	878.50
Film Producers, Inc.	50.00
International Studios	114.00
Majestic Films	28.00
Midwest Sound Service	60.00
National Supply Company	34.25
Frank Peck, Capital	14931.00
Net Income	809.75

15970

QUIZ 5-B

1. The work sheet probides information for the bookkeeper to prepare two financial reports. These are _____ and _____.

2. Find the net income of a business if the income accounts has a balance of $3500, the various expense accounts have a combined balance of $1754.50. _____

3. If the proprietorship's beginning balance totals $14,350, the net income figures to $1,745.60; what is the new proprietorship figure? _____.

4. Prepare an income statement from the following details.

Sales	468.25
Delivery Expense	248.85
Labor Expense	450.00
Miscellaneous Expense	41.10
Power Expense	140.00
Supplies Expense	70.20

5. Prepare a balance sheet using the following information:

Cash	1655.15
Delivery Equipment	3000.00
Machinery	17478.50
Office Equipment	892.10
Labor Equipment Company	3450.00
Zenith Supply Company	532.90
Paul Calvert, Capital	19608.80
Net Loss	565.80

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

UNIT 6

OBJECTIVE:

At the completion of this unit the student should be able to close all Income and Expense accounts in the ledger; balance and rule the assets, liabilities, and proprietorship's accounts; and take a post closing trial balance.

ASSIGNMENT 12

a. Read pages 143-155 of text
b. Do cases 1, 2, 3; text pages 156-157
c. Complete study guide, Workbook pages 79-80
d. Do drill 11-A, 11-B; Workbook page 81
e. Complete problems 11-1, 12-2, 11-3; Workbook pages 82-88
f. Prepare a chart illustration the business cycle. (See text page 155 for an example) If chart is done on poster paper, up to 5 extra points may be earned.

Self Checking: After completing assignment ask these questions:

1. Are all income and expense accounts closed with double lines drawn correctly?

2. Have the new balances of each asset, liability, or proprietorship account been carried forward to the next month or year?

3. Does the post closing balance sheet have equal amounts in each column?

Turn in work for evaluation.

INSTRUCTIONS: After assignment 12 has been completed, ask for Quiz 6 from the instructor. Follow same procedure as in Unit I.

QUIZ 6

1. The account to which each income account and expense account is transferred is the _____ account.

2. To close the income account, the _____ account is credited.

3. To close each expense account in the ledger the _____ account is debited and each _____ account is credited.

4. To transfer net loss to the capital account the _____ account is credited.

15972

5. To transfer net income to the proprietorship account, the _____ account is credited.

6. The process of transferring the balances of the income and the expense accounts through a summary account to the proprietorship capital account is called _____.

QUIZ 6-A

1. The income and expense account is a summary account to which all _____ and _____ accounts are transferred.

2. The entry to close the income account is _____.

3. The entry to close the expense accounts is _____.

4. The entry to transfer net income to capital is _____.

5. The entry to transfer net loss to capital is _____.

6. Closing the ledger is the process of transferring all _____ and _____ accounts through a summary account to the _____ account.

QUIZ 6-B

1. From the following information make the three closing entries in a general journal.

Room Sales	2012.00
Advertising Exp.	122.00
Automobile Exp.	36.00
Entertainment Exp.	13.00
Miscellaneous Exp.	14.00
Rent Expense	135.00
Net Income	1692.00

2. After all accounts have been closed, only the _____, _____, and _____ have balances which are left open.

3. These balances are then taken and placed into a final report to check the accuracy of journalizing, posting, and reporting called the _____ _____ _____ _____

15973

SUPPLIMENTAL ASSIGNMENTS

6-A

a. Complete problem 11-A, page 646.

Turn work in for evaluation.

ASSIGNMENT 13

Complete project 2; Workbook pages 89-98.

Turn in for evaluation.

INSTRUCTIONS: After this assignment has been completed ask your teacher for test No. 2, a 100 point test. If the test score is 75% or higher proceed on to Unit 7, Assignment 14. If the score is less than 75%, ask the teacher for a conference where the problems will be discussed and a supplimental test be given.

UNIT 7

OBJECTIVE:

At the end of this unit the student will be able to record the purchasing and selling of merchandise on account, the payment and receiving of cash, the correction of errors, purchase of other items on account, the withdrawal of merchandise by the proprietor in special journals.

ASSIGNMENT 14

a. Read text material pages 165-180
b. Complete study questions: text page 181
c. Do drill 12-A; Workbook pages 101-102
d. Complete problems 12-1, 12-2, 12-B; Workbook pages 103-110.
e. Extra credit complete study; Workbook pages 99-100
Do problem 12-S; text page 184-185.

Check your work.

Turn in for evaluation.

ASSIGNMENT 15

A. Read material from text pages 187-203
b. Answer study questions; pages 203-204
c. Complete study guide; Workbook pages 111-112
d. Do drill 13-A; work book page 113

15974

e. Complete problems 13-1, 13-2, 13-13: Workbook pages 114-120
f. Extra credit 13-S; text page 207

Check work for completeness.

Turn in for evaluation.

INSTRUCTIONS: Ask the teacher for Quiz 7. Proceed as per instructions at Unit I.

QUIZ 7

1. A special journal to record merchandise which is bought on account is a _____.

2. When posting the information from this journal all individual amounts are posted to a subsidiary ledger. The name of this ledger is _____. These will have a _____ balance.

3. The totals of this journal are posted to the _____ accounts as a debit and _____ account as a credit in the general ledger.

4. The payment of all cash is recorded in a special journal called _____ journal.

5. The source document used to record the purchasing of merchandise on _____ account is the _____. The source document used to record cash payments is the _____.

6. When merchandise is purchased with cash it is recorded in the cash payments journal by debiting _____ and crediting _____.

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: VIII. POWER FLOW

MILESTONE: VI. DIFFERENTIAL

PERFORMANCE OBJECTIVE NO.: 6 TITLE: Remove, Disassemble, Check, Reassemble, and Replace Differential

CONDITIONS:

BEHAVIOR:

20. Replace attaching bolts following all steps as outlined in the manual
21. Raise automobile to a comfortable working height
22. Remove safety jacks and store in the proper place
23. Connect all parts and accessories following steps as outlined in the manual
24. Make all tests and checks as outlined in the manual
25. If all tests and checks are satisfactory, return tools and materials to proper location
26. Lower automobile to the floor
27. Return automobile to proper parking area
28. Remove protective seat covers from front seat and store in the proper place
29. Clean work station for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily remove, disassemble, check, reassemble, and replace the differential assembly in 6 hours.

Learning time: 8 hours

7-B
Page 2

2. In a general ledger open the following accounts needed in this exercise. Allow four lines for each account. Record the balance for each account for which a balance is given. Date the balance September 30 of the current year.

Acct. No.	Account Title	Balance
11	Cash	$4,124.20 (Dr.)
21	Accounts Payable	1,187.00 (Cr.)
32	Richard Burton, Drawing	
51	Purchases	
63	Miscellaneous Expense	
64	Rent Expense	
65	Salary Expense	

The cash payments and purchases transactions completed by Richard Burton during October of the current year are given below.

Instructions: 3. Record the cash payments in a cash payments journal. All payments are made by check. Number the checks consecutively beginning with No. 110.

Record the purchases in a purchases journal. Number the purchases consecutively beginning with 81.

Oct. 2. Paid $180.00 for the October rent.
3. Purchased merchandise on account from Monticello China Company, $628.30
4. Paid $415.60 to Monticello China Company on account.
5. Purchased merchandise on account from Lynn China Company, $764.30
7. Paid $230.20 to Lynn China on account
14. Paid $324.00 for semimonthly payroll.
15. Purchased merchandise on account from Zaneville Pottery Company, $380.40
17. Paid $281.20 to Zanesville Pottery Company on account.
21. Paid $16.80 for electricity bill. (Misscellaneous Expense)
22. Purchased merchandise on account from Marshall Potteries, $520.30
23. Paid $260.00 to Marshall Potteries on account.
26. Paid $16.25 for October telephone bill. (Misscellaneous Expense)

QUIZ 10-B

Write the letter in the blank preceding the statement that represents the statement correctly answering the following.

a. Adjustment entries
b. Closing entries
c. Account form of balance sheet
d. Assets
e. Capital statement
f. Cost of merchandise available for sale
g. Cost of merchandise sold
h. Expenses
i. Gross-profit on sales
j. Income
k. Income statement
l. Liabilities
m. Net income
n. Net loss
o. Proprietorship
p. Report form of balance sheet
q. Schedule of accounts payable
r. Schedule of accounts receivable

_____ 1. A list of all customers that shows the balance to be collected from each customer and the total amount to be collected from all customers is called a . . .

_____ 2. When the expenses of a business are greater than the gross profit on sales, the difference is called . . .

_____ 3. When the total liabilities are subtracted from the total assets, the remainder is called . . .

_____ 4. Beginning merchandise inventory plus purchases equals . . .

_____ 5. A financial report that summarizes the changes in the proprietor's capital during a fiscal period is called a . . .

_____ 6. The entries recorded in the general journal to make the necessary changes in the general ledger accounts at the end of a fiscal period are . . .

_____ 7. The income that a merchandising business earns from operation before expenses are deducted is called. . .

_____ 8. A list of all creditors that shows the balance owed to each creditor and the total amount owed to all creditors is called a . . .

Supplies	14	504.00
Prepaid Insurance	15	540.00
Accounts Payable	21	1,780.00
W.M. Burton, Capital	31	15,018.40
W.M. Burton, Drawing	32	450.00
Inc. and Exp. Summary	33	---------
Sales	41	8,545.15
Purchases	51	4,870.20
Delivery Expense	61	485.45
Insurance Expense	62	---------
Miscellaneous Expense	63	361.25
Rent Expense	64	361.25
Salary Expense	65	300.00
Supplies Expense	66	---------

Inventories, January 31, 19--
Merchandise inventory, $12,210.50
Supplies inventory, $315.00
Prepaid insurance, $520.00

INSTRUCTIONS: 1. Prepare an eight-column work sheet.

2. Prepare the income statement and the balance sheet.

3. Record the adjusting and the closing entries in the general journal.

15994

UNIT 11

OBJECTIVE

At the end of this unit the student will be able to record in the different journals, post to the general and subsidiary ledgers, prepare the financial cycle for a fiscal period of one month.

ASSIGNMENT P 1

Complete practice set entitled "Spencer Athletics Goods."

Note This is to be obtained from the instructor.

INSTRUCTIONS

a. Open instruction envelope No. 1. Read it carefully.
b. Proceed by going from one instruction to the next. Complete each instruction before going on. As each envelope is completed bring the completed information to the instructor to be checked for possible errors. Then proceed on to the next envelope.
c. When the practice set has been completed, ask for test 4. Answers for the test will be obtained from the practice set.
d. Turn in both the completed practice set and the test together for evaluation.

UNIT 12

OBJECTIVE

At the completion of this unit the student will be able to record in a combination journal all the business transactions that take place during a fiscal period.

ASSIGNMENT 23

a. Read pages 405-416 of text
b. Compelte study guide Workbook pages 205-206
c. Do problems 23-1 23-2, 23 S Workbook pages 207-211
d Extra credit 23-B Workbook page 211

Turn work in for evaluation.

INSTRUCTIONS Ask the teacher for Quiz 12. Do as instructions of past units.

15995

QUIZ 12

1 The five journals that are combined to form the combination journal are _____, _____, _____, _____ and _____.

2. The cash on hand is recorded on line _____ of the combination journal.

3 Each amount in the _____ debit column and _____ credit columns are posted to the general ledger.

4. Each amount in the _____ debit and credit column is posted individually to a customer's account in the accounts receivable ledger.

5 Each amount in the _____ debit and credit columns is posted individually to the creditor's account in the accounts payable ledger.

6 The title of the customer's and creditor's accounts are given in the _____ column.

7. An amount of cash kept on hand and used for making small payments is called a _____.

8. In establishing a fund used to pay small amounts of cash for expenses the account _____ is debited and the account _____ is credited in the journal.

QUIZ 12A

1 A _____ is used to record cash receipts, cash payments purchases, sales, and miscellaneous entries into one book of original entry.

2. A memorandum entry is recorded on line _____ of a journal.

3 Each amount of the general debit and credit columns of a journal is posed to the _____ ledger.

4. Each individual amount of the accounts payable columns is posted to the separate accounts of the creditor in the _____ ledger.

5 Each individual amount of the account receivable columns is posted to the separate account of each customer in the _____ ledger.

6 A petty cash fund is _____.

7. To establish the petty cash fund in the journal, the account _____ is debited and the account _____ is credited.

15996

SUPPLEMENTAL ASSIGNMENT
12-B

INSTRUCTIONS 1. Record on page 6 in a combination journal the following transactions completed by R. H. Holt during the month of May of the current year

May 1. Issued Check No. 133 for $50 to establish a petty cash fund.
1. Received $78.67 from Paul Jones on account.
2. Issued Check No. 134 for $150 for the May rent.
3. Sold merchandise on account to Henry Jackson, $23.98
3. Cash sales for May 1-3 were $206.80
5. Purchased merchandise on account from Lamb & Sons, $361.25
6. Issued Check No. 135 for $427.47 to Norton Mfg. Co. on account.
7. Received $113.50 from Thomas Lucas on account.
9. Issued Check No. 136 for $75 for a cash purchase of merchandise.
10. Cash sales for May 5-10 were $488.55
12. Received $25 for an old display table. (Store Equipment)
13. Sold merchandise on account to Fred Piper, $103.75
15. Issued Check No. 137 for $141.36 to Baker Bros. on account.
16. Issued Check No. 138 for $300 to Mr. Holt for a withdrawal for personal use.
17. Cash sales for May 12-17 were $516.71
19. Purchased merchandise on account from Beaver & Bent, $735.15.
21. Issued Check No. 139 for $33 advertising. (Advertising Expense)
23. Sold merchandise on account to Robert Coyne, $45.
24. Cash sales for May 19-24 were $538.95
26. Issued Check No. 140 for $67.89 for a cash purchase of merchandise.

INSTRUCTIONS 2. Assume at this point of the problem you have reached the bottom of the page. Total all columns and forward to the next page of the combination journal. Then continue to journalize the following transactions

May 27. Issued Check No. 141 for $505.40 to Boswell Company on account.
29. Issued Check No. 142 for $73.15 for utility bills for the month. (Miscellaneous Expense)
31. Issued Check No. 143 for $38.45 for delivery expense.
31. Issued Check No. 144 for $330 for the payroll. (Salary Expense)
31. Issued Check No. 145 for $41.80 to replenish the petty cash fund. Advertising Expense, $7.50, Delivery Expense, $1.50 and Misc. Expense, $14.60.
31. Cash sales for May 26-31 were $471.10.

INSTRUCTIONS 3. Foot all columns of the combination journal and prove the equality of debits and credits.
4. Total and rule the combination journal.

15998

UNIT 13

/

OBJECTIVE

At the end of this unit the student will be able to record the entries for sales returns, purchases returns, payrolls, and payroll taxes.

ASSIGNMENT 24

a. Read text material pages 421 432
b. Complete study guide Workbook pages 213-214
c. Do drill 24 A Workbook page 215
d. Complete problems 24-1 24-2, 24 B Workbook pages 216-223
e. Extra credit problem 24 S; text page 438

Turn in for evaluation.

ASSIGNMENT 25

a. Read text material pages 439-453
b. Complete study quide Workbook pages 225-226
c. Do problems 25-1, 25-2, 25-3, 25-4
d. Extra credit 24-S, 24-B

Turn in for evaluation

ASSIGNMENT 26

a. Read text material pages 459-470
b. Do study guide Workbook pages 235-236
c. Complete problems 26-1 26-2, 26-3

INSTRUCTIONS At this point ask the teacher for test No. 6. Follow the instructions that have been given for other tests.

ASSIGNMENT 27

Complete Project 3 Workbook pages 243-264

INSTRUCTIONS Ask the teacher for Quiz 13. Follow procedure of previous units.

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: IX. CHASSIS

MILESTONE: I. STEERING GEAR ASSEMBLY

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Disassemble, check, and Reassemble Steering Gear Assembly

CONDITIONS:

This assignment will be performed on a steering gear assembly obtained from the parts storage room.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Obtain steering gear assembly from parts storage room
2. Select proper manual and turn to appropiate chapter
3. Select proper tools and materials
4. Disassemble steering gear assembly following all steps as outlined in the manual
5. Identify all parts and their function
6. Perform all checks and tests as outlined in the manual
7. If all checks and tests are satisfactory, reassemble the steering gear assembly
8. Make final check, test and adujustments following all steps as outlined in the manual
9. If final checks, tests, etc. are satisfactory, return steering gear assembly to parts storage room
10. Return tools and materials to proper place
11. Clean work station for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily disassemble, check, and reassemble a steering gear assembly in 1½ hours

Learning time: 3 hours

c. Received a check from A. J. Fox in payment of our invoice of May 20. The terms of the sale were 1/20, n/30. The original amount of the invoice was $340.00

d. Received a credit memorandum for $40.00 from F. R. Rhodes for merchandise returned to them.

e. Issued a credit memorandum for $8.00 to A. R. Wells for merchandise returned by them on our invoice of June 14.

QUIZ 13B

1. A credit memorandum is a source document for recording a transaction relating to _____.

2. _____ is debited _____ and the deptor are credited to record a transaction in which merchandise is returned by a charge customer.

3. _____ and the creditor are debited and _____ is credited by a buyer to record transactions in which credit is received for merchandise returned to a _____.

4. When a seller receives cash on account from a charge customer, and a discount is allowed cash and _____ are debited and accounts receivable and the _____ are debited.

5. When a buyer issues a check to a creditor to pay an invoice, and a discount is allowed accounts payable and the _____ are debited and _____ and cash are credited.

b. Do problem 25-A, page 665

c. Do problem 26 A, pages 665-666

13 B

a. See the attached sheet.

b. See the attached sheet

c. See the attached sheet

SUPPLEMENTAL ASSIGNMENT
13 B Part A

INSTRUCTIONS 1. Record the following selected transactions which were completed by John Murphy during the month of June, in a combination journal like the All purchases and sales are made on account.

June 2. Received a check for $174.54 from B. C. Porter for our invoice of May 23 for $176.30 less a 1% discount of $1.76.

3. Purchased merchandise amounting to $463.81 from McHenry Bros.
4. Sold merchandise amounting to $113.66 to T. B. Baxter.
6. McHenry Bros. allowed us credit for $11.50 for defective merchandise.
6 Issued Check No 224 for $463.69 to Peyton & Co. in payment of their invoice of May 29 for $473.15 less a 2% discount of $9.46.
9 Issued a credit memorandum for $7.96 to T. B. Baxter for merchandise returned.
11. Issued Check No. 230 for $443.26 to McHenry Bros. in payment of the balance of $452.31 on their invoice of June 3 less a 2% discount of $9.05.
The amount of the invoice of June 3 was $463.81, but a credit of $11.50 was received on June 6. The balance of the invoice to which the discount applied was therefore $452.31, and the discount was 2% of this amount.
12 Sold merchandise amounting to $364.50 to A. D. King.

16001

16002

13. Issued Check No. 235 for $43.60 to Red Arrow Lines for delivery expense on merchandise sold.
14. Received a check for $104.65 from T. B. Baxter and gave him credit for that amount plus $1.06, a 1% discount.
    The amount of the invoice of June 4 was $113.66. A credit of $7.95 was given on June 9. The balance of the invoice to which the discount applies was therefore $105.71.
17. Purchased merchandise amounting to $611.44 from the Clyde Co.
22. Received a check for $360.85 from A. D. King for our invoice of June 12 for $364.50 less 1% discount of $3.65.
24. Sold merchandise amounting to $183.25 to B. F. Vance.
26. Issued Check No. 255 for $599.21 to the Clyde Co. in payment of their invoice of June 17 for $611.44 less a 2% discount of $12.23.
27. Purchased merchandise amounting to $534.65 from Knight & sons.
30. Issued Check No. 264 for $51.80 to Red Arrow Lines for delivery expense on merchandise sold.
30. Received a credit memorandum for $21.30 from Knight & Sons for merchandise returned by us.
30. Issued Check No. 266 for $46.21 to replenish the petty cash fund. The payments were as follows: Supplies, $12.14 Misc. Expense $17.32 Delivery Expense, $16.75

INSTRUCTIONS 2. Foot, prove and rule the combination journal.

SUPPLEMENTAL ASSIGNMENT
13 B Part B

The following table gives the hours worked and the hourly rate for ten employees. Each employee is paid his regular hourly rate for a maximum of 8 hours for Monday through Friday. If he works more than 8 hours on any of these five days, he receives time and a half for the overtime. He also receives time and a half for Saturday.

Name	Hours Worked						Hourly Rate
	M	Tu	W	Th	F	S	
Henry A. Abbott	8	8	8	8	8	4	$1.40
Robert C. Barton	8	8	8	8	10		1.60
Marvin Easton	8	10	8	8	8		1.70
Laurence Hershey	8	8	8	8	8	3	1.30
William Morton	8	8	8	0	8		1.95
Richard Parker	8	10	8	8	8		2.20
Raymond R. Ridge	8	8	8	8	10		2.00
Frank O. Sutto	8	8	8	8	8	4	2.00
Martin Tucker	8	8	8	8	8	2	1.80
David M. Weber	8	10	8	8	8		2.10

Determine the earnings for the week for each employee and the total earnings for all employees.

SUPPLEMENTAL ASSIGNMENT
13-B Part C

The Caldwell Print Shop completed the payroll transactions given below during the period January 1 to February 5. The Caldwell Print Shop is liable for payroll taxes at the following rates FLCA taxes, 3 1.3% state unemployment taxes, 2.7% and federal unemployment taxes 18% It is also liable for the purchase of U.S. Savings Bonds as the accumulated withholdings for each particular employee reaches the necessary amount.

INSTRUCTIONS 1. Open the following accounts in the general ledger and record the balances as of January 1 of the current year

SUPPLEMENTAL ASSIGNMENT
14 B Part A

R. J. Gifford purchased the following items of equipment during the first three years that he was in business.

Fixed Asset	Date of Purchase	Initial Cost	Annual Rate of Depreciation
1	January 4, 1960	$2,400	25 %
2	June 30, 1960	250	20 %
3	January 6, 1961	6,000	5 %
4	September 6 1961	60	12 %
5	April 1 1962	3,300	6 2/3 %
6	December 3 1962	72	16 2/3 %

INSTRUCTIONS 1. Record the adjusting journal entry for the total depreciation expense for (a) the year ended December 31, 1960, (b) the year ended December 31, 1961 and (c) the year ended December 31, 1962

2. Find the book value as of December 31, 1962 of each item of equipment.

---

14 B Part B

Joseph Egan, a retail shoe merchant, maintains in his general ledger accounts with Equipment, Allowance for Depreciation of Equipment, and Depreciation Expense.

INSTRUCTIONS 1. Record in a combination journal the following transactions selected from those completed by Mr. Egan during the current year.

Jan. 2 Issued Check No. 3 for $410 for a new electric typewriter.
Mar 31 Recorded the estimated depreciation of equipment for the quarter ended March 31 $162.50
Apr 1 Discarded two chairs for which there was no further use and which could not be sold. The chairs cost $75 and had a book value of $10 at the time they were discarded.
Jun 30 Recorded the estimated depreciation of equipment for the quarter ended June 30, $165.30
July 1 Sold an old office desk to a secondhand dealer for cash, $20. The desk cost $60 and had a book value of $12 when it was sold.
Aug 15 Issued Check No. 261 for $125 for new display shelves.
Sept.30 Recorded the estimated depreciation of equipment for the quarter ended September 30, $164.55
Oct. 1 Bought a new typewriter for $155 cash (Check no. 301) and an old typewriter. The old typewriter cost $145 and had a book value of $50 at the time of the trade in.

Nov 1 Sold an old adding machine for cash, $35. The adding machine cost $180 and had a book value of $46 after depreciation was recorded on September 30. The depreciation rate was $3 a quarter. (a) Record depreciation for October.

16011

15 B Part B

(b) Record the sale of the adding machine.

Dec 31. Recorded the estimated depreciation of equipment for the quarter ended December 31, $164.12.

INSTRUCTIONS 2 Foot, prove, and record the totals in the combination journal.

SUPPLEMENTAL ASSIGNMENT
14 B Part C

The Upsom Lumber Company maintains accounts with Bad Debts Expense and Allowance for Bad Debts. At the beginning of the current year the balance of the allowance for bad debts was $216.60

In this exercise you are given transactions taken from those completed by the Upsom Lumber Company during the current year.

INSTRUCTIONS 1. Record the following transactions in a combination journal.

Feb. 13 Decided that the past due account of Garry Fuller, $76.60 was uncollectable. Wrote off his account as bad debt.

Mar. 27 C. W. Lee, a charge customer became insolvent. Wrote off his account of $43 as a bad debt.

Mar. 31 (Ended of first quarterly fiscal period.) Increased the allowance for bad debts by making the necessary adjusting entry. The estimated bad debts expense for each quarterly fiscal period was 1 1/4% (.0125) of the total charge sales. The charge sales for the quarterly fiscal period ended March 31 were $11 650

May 15 R. W. Bunker, a charge customer, became insolvent. Wrote off his account of $86.50

June 30 The total charge sales for the second quarterly period ended June 30 were $9,990.80. Increased the allowance for bad debts 1 1/4% (.0125) of that amount.

Aug. 21 Decided that the past due account of Karl Hess, $123.80 was uncollectable. Wrote off his account as a bad debt.

Sept. 30 The total charge sales for the third quarterly fiscal period ended September 30 were $10 060.75 Increased the allowance for bad debts 1 1/4% (.0125) of that amount.

Dec. 31 Decided that the past due accounts of the following charge customers were uncollectible: Albert Beem $82.98; Joseph Harris, $160.30; R. B. Bough, $30. Wrote them off as bad debts in one combined entry, debiting Allowance for Bad Debts for the total.

16012
11031

Dec. 31 The total charge sales for the fourth quarterly fiscal period ended December 31 were $12 444.50. Increased the allowance for bad debts 1 1/4% (.0125) of that amount.

INSTRUCTIONS 2. Foot, prove, and record the totals in the combination journal.

Jan 31 Recorded the employer's payroll tax liabilities.

Feb. 1 Issued Check No. 63 for $37.50 to purchase U.S. Savings Bonds (2 at $18.75) for employees.

5. Issued Check No. 70 for $380.96 in payment of the liabilities for employees income taxes and FICA taxes for January.

UNIT 15

OBJECTIVE

At the end of this unit the student will be able to complete a business cycle using the combination journal, making the proper adjustments to accounts, preparing financial reports, and closing the ledger, and opening up the books for a new fiscal period.

ASSIGNMENT P 2

Complete practice set entitled "Tayler Hardware". This can be obtained from your instructor.

INSTRUCTIONS.

1. Open instruction envelope 1 and read it carefully.
2. Proceed by going from one instruction to the next completing each instruction before going on. As each envelope is complete, bring the journals, ledgers, and other papers to the instructor to be checked for possible mistakes.
3. Proceed then to the next envelope until completed. After completion ask for Test 9. Turn both the practice set and the test in together for evaluation.

Jan 31 Recorded the employer's payroll tax liabilities.

Feb 1 Issued Check No. 63 for $37.50 to purchase U.S. Savings Bonds (2 at $18.75) for employees.

5 Issued Check No. 70 for $380.96 in payment of the liabilities for employees income taxes and FICA taxes for January.

The introduction to the keyboard is called Bombing . It precedes the drill work and daily assignments. A Gregg publication entitled Basic Machine Exercises by J. H. Dool is used for the hub of the year's work Weekly tests are given to determine accuracy, speed and mastery. One important objective of the class is to help the learner develop a marketable skill on machines. It is recommended that from 3 to 5 hours work be completed each week. Credit may be awarded upon completion of the units either ¼ for a quarters work or ½ for a semester. The work may be completed in less than a quarter or spread out for as long as one year depending on released time and interest. Former students who have completed the work are recruited as Lab Assistants for credit These people add much to the program in interest and motivation especially if they are members of the Future Teachers of America.

Another objective is to give definite training to the left hand on the machine leaving the right hand free to write. Instructions are held to a minimum with drill being emphasized to the maximum. From the very beginning the operator is taught to self audit or double check each problem at the time it is run by adding downward, then up the column and comparing the totals. If they agree, then one can be reasonably sure they are correct This quick audit is the key to confident, meaningful mastery and quickly corrects faulty fingering techniques before they become habituated.

The Ten Key Machine is one of the most useful and popular machines in the business office today. Some are hand operated but most are electric.

16015

The instructor will point out and demonstrate the different machine parts and uses such as

The tape and its adjustments to the roller knobs etc.

The paper release for changing or adjusting paper.

How to change a ribbon.

The digit indicator shows the number of keys struck.

A credit balance is shown if the number subtracted is larger than the one added in-o the machine.

The use of the non add repeat clear, and multiplication keys.

Position the learner comfortably at the machine moderately erect with feet flat on the floor. Clear the machine by striking the total key before beginning a problem. Some machines must be struck twice to completely clear them. After establishing a pattern of good work habits and learning the four basic processes of adding subtracting multiplying and dividing on a ten-key machine, it is relatively easy to learn other types of business machines with complete confidence.

The paper tape will show all errors as well as all correct work completed and time spent. The tapes are to be handed in each day to be checked by a lab assistant. The operator is to keep a record of his individual scores. Fold the tapes as you would fold the hem on a blanket to about 12 inches long. Number each problem on the tape by using the non add key (23 <)

Sample illustration of data needed on each tape.

BOMBING IDEAS

CHALLENGE TO THE LEARNER (You are to use the left hand on the machine leaving the right hand free to hold a pencil).

CORRECT THINKING NECESSARY

Be enthusiastic be excited about machine know how .

Imagine that you are a bombing pilot on an aircraft carrier. You must drop your bomb and return immediately to the carrier 6,5 4 and make a perfect landing on the deck or you will be lost in the drink as the pilots say. Your fingers are the bombs and the keys are the targets. They are all numbered and the bombs must strike the correct target

USE THE LEFT HAND

1st bomber (thumb) hits targets + and T

2nd bomber (finger) hits targets 3 6,9,00 (only)

3rd bomber (big finger) is to hit targets 2 8 5,0 (only)

4th bomber (ring finger) is to hit targets 1,4,7 (only)

READY FOR ACTION follow your problem with the left hand -- read the three numbers softly aloud and BOMB!!!

A flier who wishes to become an expert bomber should bomb each target as recommended (bomb down and up it, then bomb up and down again so that you have 4 identical strikes (correct answers) in a row before trying the next target (problem).

Combinations may be used with any text or drill book.

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: IX. CHASSIS

MILESTONE: II. FRONT SUSPENSION

PERFORMANCE OBJECTIVE NO.: 2 TITLE: Remove, Replace, and Adjust Front Suspension

CONDITIONS:

This assignment will be performed on a complete automobile

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Position hoist arms and raise automobile to comfortable working height
6. Remove front wheels and drums following steps as outlined in the manual
7. Remove upper control arm assemblies, spindles, srings, lower control arms, and other parts necessary for complete removal of front suspension, following all steps as outlined in the manual
8. Identify all parts and their function
9. Perform all tests and checks as outlined in the manual

PERFORMANCE CRITERIA:

BOMBING MISSION: #5 - Bomb one more new key (0)

#21	#22	#23	#24	#25

A Business Education Individualized
Continuous Progress Research Curriculum
Development Study. Volume II.

Weber County School District, Utah.
Utah State Board of Education, Salt Lake City
MF AVAILABLE IN VT-ERIC SET.
PUB DATE - 70 272p.

DESCRIPTORS - *BUSINESS EDUCATION; *INSTRUCTIONAL MATERIALS; *INDIVIDUALIZED INSTRUCTION; TESTS; *ASSIGNMENTS; *PROGRAMED MATERIALS; SECONDARY EDUCATION; BEHAVIORAL OBJECTIVES; COURSE CONTENT; TYPEWRITING; STENOGRAPHY; OFFICE PRACTICE

ABSTRACT - With the support of school administrators, several business educators developed this package of individualized curriculum materials. These materials are arranged in four parts which pertain to shorthand I and II, typewriting and transcription, and secretarial procedures. Following the continuous progress approach this color-coded document also includes assignments and quizzes for each of the above units as based on selected textbooks. Instructions for the teacher are also included. A related volume on bookkeeping, typewriting, and business machines is available as VT 013 031, also in this issue. (JS)

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: IX. CHASSIS

MILESTONE: II. FRONT SUSPENSION

PERFORMANCE OBJECTIVE NO.: 2 TITLE: Remove, Replace, and Adjust Front Suspension

CONDITIONS:

BEHAVIOR:

10. Install upper control arm assemblies, spindles, springs, lower control arms, and other parts removed in step #7 following all steps as outlined in the manual
11. Install front wheels and drums following all steps as outlined in the manual
12. Make final tests, checks, and adjustments as outlined in the manual
13. If all tests, checks, and adjustments are satisfactory, return tools and materials to proper place
14. Lower automobile to the floor
15. Return automobile to proper parking area
16. Remove front seat covers and store in proper place
17. Clean work station for next project

If possible, use this automobile for your next project, which is wheel alignment.

PERFORMANCE CRITERIA:

To be able to satisfactorily remove, replace, and adjust the front suspension in 6 hours.

Learning time: 12 hours

INTRODUCTION

The philosophy of the continuous progress individualized instruction business curriculum of the Weber School District is to enable the student to progress at his own rate according to his ability.

Behavioral objectives are established for each course and unit within the course. Performance standards, based on the norms of average ability which have been derived from past experience in traditional teaching and recommendations from the Business and Marketing Education Guide for the Utah State Board of Education, have been set. Each student must reach this criterion before he is allowed to progress to the next unit in each course. If a student does not reach the standard, he is given supplemental material and help from the teacher to reinforce his learning and bring him to the standard established; thus, enabling him to move to the next unit. In this manner a student is able to proceed at his own rate and ability.

Instructional material has been developed so that the course is equivalent to one semester. The student receives the material as he proceeds successfully from one unit to another. Upon the successful completion of any specific individualized course, the student is awarded credit and a letter grade.

In this program, an accelerated student has the opportunity to complete a semester's work in less than 18 weeks, enabling him to complete more than one course during a year's time. On the other hand, if a student needs more time to complete the semester's work, he may take the time necessary and still receive credit and a letter grade upon

16032

completion instead of experiencing failure for not being able to "keep up" with the class.

At the end of the quarter no letter grade is given to the student. A progress report is issued so that the parent can see exactly where his child is at the end of the quarter in relation to the required work for the course with an indication on the report of where the student should be at that time. The student also keeps a progress sheet of his own so that he can keep his record.

It is important that no grade or credit be issued until the student has completed the requirements for the course.

16023

16032

INSTRUCTIONS FOR THE TEACHER

Shorthand I is set up to take one-hour's time daily of a two-hour block with Type and Transcription. If the two-hour block is not scheduled, the course can be a daily one-hour class. However, it is suggested that the students who are registered for shorthand should also be registered for a type class during the same semester.

The lessons in Chapter 1 are introduced to the class as a group. After successfully completing Chapter 1, the students begin to progress at their own rate according to the standards that have been determined. The students are encouraged to complete at least four lessons a week to be able to complete the course in the prescribed time. Inasmuch as each lesson must be presented individually during the first semester, it necessitates the teacher introducing several lessons during a class period. Homework can readily be checked off before each lesson is introduced during the first semester. Second semester's homework is checked off before giving the chapter test. A paper should be available in a convenient place where the student can indicate which lesson, test, or take is needed.

The tests for the first semester's chapters should be duplicated. Alternate tests should be made for those students who do not pass the test the first time. Because some students move ahead rapidly, all tests should be ready at the beginning of the school year. (A sample test is included.) The tests given during the second semester should be dictated. Dictation speed should not exceed the minimum requirement for the first semester. NOTE: The first score the student receives on a test is the one that should be used in determining his grade.

Weekly "takes" should be given after a student has completed Lesson 20. It is suggested that one day a week be designated as "take" day. All students should take them on this day.

Shorthand Dictation A B C's by Allien R. Russon, University of Utah, 1963, is used for daily dictation and weekly "takes" during the first semester. This material is correlated with the Gregg shorthand book. No student should be given one of the "takes" that is beyond the lesson he is working on in his text.

A teacher's guide has been included which indicates the correlation of the lessons introduced with material to be dictated from the A B C book. The word lists indicated in the teacher's guide should be taken from the previous day's assignment. It is to be noted that tapes are introduced at the beginning of Chapter 9. The students should be encouraged to take dictation from these tapes at least ten minutes per day. If tapes aren't available, the teacher should give "live" dictation daily.

Shorthand I
First Semester

TEACHER'S GUIDE

This guide is to correlate the introduction of lessons with dictation material from Shorthand Dictation A B C's. It also indicates at what point various phases of Shorthand I are introduced. Brief forms should, of course, be reviewed throughout the semester. Additional dictation and writing practice material can be taken from the shorthand book.

Chapter I

Lessons 1-5 Introduce each lesson at the board to the entire class. Each day the previous lesson should be reviewed.

Lesson 6 Introduce writing. Go back to Lesson 1 and review.

Test on Chapter I (after Lesson 6)
Duplicated test on theory (50 words)
Duplicated test for transcription by hand (a paragraph from the chapter)

If the student does not pass the test according to the standard set up, he should review theory. Check with him to help where needed.

A time limit should be set for the tests. It is suggested that a 20-minute limit be set on each duplicated test, 10 minutes for 50-word brief form tests, and 20 minutes for 100-word theory tests.

Chapter II

Dictation from new material will begin in this chapter. Preview words are given in the assignments on the student's instruction sheets so that they can be practiced before the material is dictated.

Lesson 7 Write, review rules, etc.
Lesson 8 Write, review rules, etc.
Lesson 9 Write, review rules, etc.
Lesson 10 Begin dictation on new material from Shorthand Dictation A B C's (page 5 - 4th day)
Lesson 11 A B C (page 5 - 5th day)
Lesson 12 A B C (page 5 - 1st day)

Test on Chapter II (after Lesson 12)
Duplicated test on theory (50 words)
Duplicated test for transcription by hand (a paragraph from the chapter)
Brief Form test (25 words - dicatated)

16039

Chapter III

Lesson 13	Practice preview words before giving ABC dictation (page 6 - 2nd day)
Lesson 14	A B C (page 6 - 3rd day)
Lesson 15	A B C (page 6 - 4th day)
Lesson 16	A B C (page 6 - 5th day)
Lesson 17	A B C (page 7 - 1st day)
Lesson 18	A B C (page 7 - 2nd day)

Test on Chapter III (after Lesson 18)
Duplicated test on theory (50 words)
Duplicated test for transcription by hand (a paragraph from the chapter)
Brief Form test (25 words - dictated)

Chapter IV

Lesson 19	A B C (page 7 - 3rd day)
Lesson 20	A B C (page 7 - 4th day)
	At this point, the student will begin "takes." One "take" will be given a week on a designated day. A student should never take a "take" that is beyond the point where he is in the shorthand book.
Lesson 21	A B C (page 9 - 1st day)
Lesson 22	A B C (page 9 - 2nd day)
	At this point the student should be reminded to review brief forms. For quick review the student should use the brief forms listed on the back page of the text.
Lesson 23	A B C (pages 9 and 10 - 3rd day)
Lesson 24	A B C (page 10 - 4th day)

Test on Chapter IV (after Lesson 24)
Duplicated test on theory (50 words)
Duplicated test for transcription by hand (a paragraph from chapter)
Brief Form test (25 words - dictated)

Chapter V

Lesson 25	Preview words and dictate A B C (page 12 - 1st day)
Lesson 26	A B C (page 12 - 2nd day)
Lesson 27	A B C (page 12 - 3rd day)
Lesson 28	A B C (page 13 - 4th day)
Lesson 29	A B C (page 15 - 1st day)
Lesson 30	A B C (page 15 - 2nd day)

16040

From this point on the tests will be transcribed on the typewriters. Instruction should be given as to how this is to be done. On the theory tests, the transcription should be typed in the space provided on the form. On the transcription tests, the transcription should be typed at the bottom of the paper on which the test has been duplicated. Brief form tests should be taken on the forms that have been duplicated for the theory tests.

Test on Chapter V
- Duplicated test on theory (50 words)
- Duplicated test for transcription (a paragraph from the chapter)
- Brief Form test (25 words)

Chapter VI

Begin word lists with this chapter. Dictate 10 to 25 words at the beginning of the class. These words should be taken from the previous lesson. Allow from one minute to two minutes for transcription. Transcription will be by hand unless dictation is given at the typewriter.

Lesson 31	Preview words and dictate A B C (page 16 - 3rd day)
Lesson 32	Introduce punctuation (commas) A B C (page 16 - 4th day) Word list (10 words) from Lesson 31
Lesson 33	Word list (10 words) from Lesson 32 A B C (Page 19 - 1st day)
Lesson 34	Word list (10 words) from Lesson 33 A B C (page 19 - 2nd day)
Lesson 35	Word list (10 words) from Lesson 34 A B C (pages 19 & 20 - 3rd day)
Lesson 36	Word list (10 words) from Lesson 35 A B C (page 20 - 4th day)

Test on Chapter VI
- Duplicated test on theory (50 words)
- Duplicated test for transcription (a paragraph from the chapter)
- Brief Form test (25 words)

Chapter VII

Lesson 37	Preview words and dictate A B C (page 23 - 1st day)
Lesson 38	Word list (10 words) from Lesson 37 A B C (page 24 - 2nd day)
Lesson 39	Word list (10 words) from Lesson 38 A B C (24 - 3rd day)
Lesson 40	Word list (10 words) from Lesson 39 A B C (pages 24 & 25 - 4th day)
Lesson 41	Word list (10 words) from Lesson 40 A B C (page 28 - 1st day)
Lesson 42	Word list (15 words) from Lesson 41 A B C (page 28 - 2nd day)

16041

RELATED INSTRUCTION

SCHOOL: PETERSBURG, VIRGINIA FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: IX. CHASSIS

MILESTONE: III. FRONT SUSPENSION

PERFORMANCE OBJECTIVE NO: 3 TITLE: Alignment

CONDITIONS:

Student will learn related information listed below

LEARN	REFERENCE	SOURCE
1. Aligning front end	1. Automotive Chassis and Body, by Crouse. pp. 228 through 262 Automotive Chassis Workbook, by Crouse. Job 17	1. Related Information Class
2. Front end alignment	2. Teaching Machine card 17B	2. Teaching Machine (Shop)

1599

Test on Chapter VII
Duplicated test on theory (50 words)
Duplicated test for transcription (a paragraph from the chapter)
Brief Form test (50 words) Allow ten minutes for transcription.

Chapter VIII

Lesson 43	Preview words and dictate A B C (page 28 - 3rd day)
Lesson 44	Word list (15 words) from Lesson 43 A B C (page 29 - 4th day)
Lesson 45	Word list (15 words) from Lesson 44 A B C (page 33 - 1st day)
Lesson 46	Word list (15 words) from Lesson 45 A B C (page 33 - 2nd day)
Lesson 47	Word List (15 words) from Lesson 46 A B C (page 34 - 3rd day)
Lesson 48	Word list (15 words) from Lesson 47 A B C (page 34 - 4th day)

Test on Chapter VIII
Duplicated test on theory (50 words)
Duplicated test for transcription (a paragraph from the chapter)
Brief Form test (50 words) Allow 10 minutes for transcription

At this point the student may begin to take 100-word theory tests. At least one of these tests must be passed with 80% accuracy or above to complete the requirements for the semester's work. Just the transcription is to be checked; however, a misspelled word is counted as an error. Students are allowed to use their dictionaries.

Chapter IX

Tapes are introduced at this point. Students are to spend at least 10 minutes during the class period to take dictation from tapes. These are to be speed-development tapes. The students should be encouraged to take the speed that is a little higher than the one they can take comfortably to push their speed up.

The lessons in Chapter IX do not have to be introduced individually inasmuch as they are review. Brief forms and their derivatives are reviewed. Students should complete the assignments in this chapter on their own.

Test on Chapter IX
Dictate letter from chapter at 40 words per minute. Two points off for each error. Spelling is counted as an error.
Brief Form and derivative test (50 words) Allow 10 minutes for transcription.

16041 16042

Chapter X

There is no test for this chapter. The students are to complete the assignments as instructed on their chapter guide sheet.

At this point if the student has already completed the semester's requirements for transcription from homework notes, it is not necessary that he transcribe the following paragraphs. Each lesson, however, should be completed as a homework assignment.

Lesson 57 - 502, 499
Lesson 58 - 508, 509
Lesson 59 - 514, 515
Lesson 60 - 520, 521
Lesson 61 - 524, 527
Lesson 62 - 530, 534
Lesson 63 - 541, 542
Lesson 64 - 548
Lesson 65 - 554
Lesson 66 - 558, 561
Lesson 67 - 568
Lesson 68 - 574
Lesson 69 - 580

Each student must pass a 100-word theory test with at least 80 per cent accuracy to complete the first semester's requirements.

16043

GENERAL INSTRUCTIONS FOR SHORTHAND I AND II

Supplies

Each student should have the following supplies for his own use at all times:

1. Pen (this need not be an expensive fountain pen--a good ballpoint is sufficient.)
2. Pencil (you should have one with you at all times to use as a spare in case your pen does not write). A pencil will also be used for checking your work and for certain markings.
3. Typing paper (carbon paper will be supplied for you). Have your own.
4. Typing eraser--be sure to have your own. There will be no borrowing of erasers.
5. Shorthand notebooks (one for homework, and one for classroom work).
6. Dictionary (each student must have his own dictionary). This need not be expensive. A paperback edition which costs about 50 cents is very good for your use in class.
7. A folder in which to keep your type paper and assignments. A folder with side pockets is good because it helps keep your papers and work organized.
8. Your textbooks will be furnished. Take good care of them because you will be responsible for them. If they are lost, you will be required to pay for them, and if they are damaged in any way, you will have to pay the cost of repair.
9. Mark all of your own supplies with your name in case you leave them in the classroom. With your name on them they could be returned to you.

Instructions on the Use of Notebooks

1. Keep two notebooks--one for classroom dictation, and the other for homework lessons. Bring both notebooks to class with you each day.
2. In your homework notebook, make certain that you identify each lesson. Also, circle the number of each paragraph as you copy your lesson. This is necessary for reference when you are called upon to transcribe or read from your homework notes.

16044

3. When writing in your notebooks, be sure to go completely through the book on one side of the paper, then turn your notebook over and go completely through it on the other side of the paper. In this way you do not waste paper and it saves time during dictation. When the notebook is filled, keep it for at least one week before throwing it away. You may be called upon to transcribe from your notes that have been written two or three days previously.

4. Keep your notebooks in a definite place on your desk. Then you will be ready to take dictation at a moment's notice, assuming, of course, that you keep a pen and pencil with your notebook at all times.

5. Keep a rubber band around the <u>used</u> portion of your notebook.

6. Place the date and lesson number at the bottom of the first page of the day's dictation or homework lesson.

7. Draw a line through each letter as soon as you transcribe it.

8. When you are interrupted in transcribing a letter, mark your place with a pencil.

9. Leave a space at the beginning of each letter dictated for mailable transcription for special instructions such as mailing directions, multiple carbons, and so on.

10. Write out unfamiliar names in longhand. (Do not do this when taking "takes.")

11. When the boss (or teacher) is interrupted during dictation, use the time to read your shorthand notes, improving outlines and inserting punctuation.

12. Indicate the end of each item in some way such as by a wavy line.

13. When it is necessary to take dictation on loose paper, fasten the notes in the proper place in the notebook for later reference.

14. Learn to turn pages in your notebook while taking rapid dictation.

<u>Timed Writings</u>

Timed writings will be given at least once a week as a class to measure your typing speed and accuracy. Additional timed writings will be given individually as requested.

Your papers should be set up as follows:

16045

1. Type the following in the upper left corner of your paper:*

*(Shorthand I Students)	*(Shorthand II Students)
Name	Name
Type and Transcription	Shorthand II
Semester 1 or 2	Semester 1 or 2
Timed Writings	Timed Writings

2. Start your timed writing about an inch and an half from the top of your paper.

3. Set your machine for double spacing, 70-space line unless given other instructions by your teacher.

4. Record your words per minute and number of errors at the top of your paper in this manner: 55/4

5. To pass a timed writing, you must not have more than one error per minute.

6. Circle the entire word where an error appears.

7. Hand in "passing" timed writings only. A certain number (shown on your instruction sheets) will be required each semester.

Tapes

Tapes at various speeds are available to help you increase your speed in taking dictation. Regular dictation practice is necessary. You should allow yourself at least 10 minutes a day for dictation.

You will each be given a set of ear cushions for your own use. These should be kept in an envelope, stapled to your folder so that you will have them when you need them. If you lose them, you will be charged twenty cents for a new set. You must use your own set always.

All of the equipment involved in using taped material is expensive. If you are careless with this equipment, it might throw the entire system out and penalize all of the students until repairs are made. Please use the equipment with care.

If at any time your set does not work properly, be sure to report the trouble to your teacher immediately.

Dial the channel for the speed that will help you the most. You should practice at a speed that is a little beyond your ability to write at that time.

Brief Forms

It is necessary for you to know how to write brief forms without

hesitation. Brief forms are words that are used often and have an abbreviated way of writing them. If you do not know these, you will have to write them out according to sound and this, of course, would take too much time. Learn your brief forms well. They are introduced in small groups to enable you to memorize them. You should review brief forms often throughout your study of shorthand to help you increase your ability to take dictation.

One way to help you automatize your writing of brief forms is suggested by Charles Swen, a champion shorthand writer. As a list of brief forms is presented, you take a piece of paper and copy the brief forms in one column. Then transcribe the brief forms by writing the transcription along side the shorthand symbol. After doing this, fold the paper under so that the shorthand forms do not show and then write new shorthand forms along side the longhand transcription. Next, fold the longhand words under and transcribe the shorthand forms. Continue this process until you have used the entire sheet. By the time you have written the brief forms and transcribed them a number of times you will have learned them.

When brief form tests are given, they will be dictated "live" or on tape. The special form to use for these tests will be provided. Transcription will be done on the typewriter. On brief form tests, both the shorthand forms and the transcription will be checked.

Word Lists

Word lists are used as a daily homework theory check. Fifteen to twenty-five words will be dictated by your teacher and should be transcribed on your typewriter.

Type your name in the upper left corner of your paper. Set your machine for double spacing, and set your left margin at 15. Words should be typed one under another in a column. If you cannot transcribe a word, leave the space--you may be able to transcribe it after you have completed the list. If you misspell a word while transcribing, do not erase or "x" out the mistake, just use the space bar and space once and retype the word correctly. You will be timed on your transcription and so you do not want to waste any time. Misspelled words will be counted as errors.

Always have a piece of paper in your machine with your name typed in the upper left corner.

Theory Tests

Tests will be given to test your knowledge of shorthand theory at the end of each chapter. The tests may be transcription from shorthand plates, "live" dictation, or "taped" dictation.

When taking a theory word test from "live" dictation or from "tape" a special form will be provided. You will write the shorthand symbol

16047

as the words are dictated and then be given a time limit for transcription. The transcription should be typed next to the shorthand form. Care should be taken in transcribing these words inasmuch as a misspelled word is counted as an error.

When a 100-word theory test is given, you will need two of the provided forms. These sheets should be stapled together before handing them in, and your name should appear on each page.

Takes

"Takes," three-minute timed dictation at various speeds, will be given at least once a week to help you measure your progress.

The material will be unpreviewed and will be dictated "live" or on tape. You will be allowed twenty minutes to transcribe and the transcription will be on the typewriter.

These "takes" are given to measure your ability to take dictation at a certain speed. Ninety-five per cent accuracy is required to pass a "take." A record of your achievement will be posted on the bulletin board, and you will be required to pass three takes at a certain speed before moving on to the next speed. Each "take" that is transcribed should be handed in to be recorded regardless of whether it is "passing" or not. A record will be kept of the number of errors made so that you will be able to see your progress. Word for word transcription will be required.

Directions for Transcribing "Takes"

1. Type your name, and the speed of your "take" in the upper left corner of your paper.

2. Use a 70-space line with five spaces for paragraph indention.

3. Set your machine for double spacing.

4. Type the salutation on one line followed with a colon:

5. Type the complimentary closing on a separate line followed with a comma. Start the closing at 50.

6. Erasers may be used for corrections.

7. When transcribing, if there is an outline you cannot transcribe at the time, leave a space. When you have completed the transcribing of the letter, if you can fill in the work or words that have been omitted, use the blank space that you have left. If you did not leave enough space for the word or words that were omitted, use the blank space between lines for the insertion.

SHORTHAND I
(First Semester)

BEHAVIORAL OBJECTIVE

At the end of the first semester:

1. The student will have completed the theory of Gregg shorthand and be able to pass a theory test consisting of 100 words with at least 80% accuracy. The words will be dictated in no more than 10 minutes and should have been transcribed in 20 minutes. Words transcribed incorrectly and misspelled words will be counted as errors. Only the transcription will be checked. The words used will cover all phases of shorthand theory.

2. The student will be able to pass a 50-word brief form test with 95% accuracy. The words will be dictated at the rate of one every 1 1/2 seconds and transcribed with a 10-minute time limit. Shorthand and transcription will be checked--each will be worth one point. Misspelled words will be counted as errors.

3. The student will be able to transcribe, on the typewriter, paragraphs from homework notes. She should be able to transcribe each shorthand outline accurately. The transcription should be set up on type paper using a 60- or 70-space line with double spacing and indented paragraphs. Transcription from homework notes will consist of one letter. A maximum or three errors an assignment will be allowed to pass. A minimum or ten transcriptions will be required.

4. The student will be able to transcribe a theory test at the completion of each chapter. This test will consist of 50 words taken from each chapter. Eighty percent accuracy will be required to pass. There will be a 20-minute time limit. The student also will be able to transcribe a paragraph (or letter) from each chapter. Eighty per cent accuracy will be required to pass in a 20-minute time period.

5. The student will be able to read from shorthand plates in the book without hesitation on studied material. She should be able to read new words through spelling the shorthand form using the shorthand alphabet.

6. The student will be able to take dictation at 40 words per minute for three minutes on new, unpreviewed material and transcribe the dictation with 95% accuracy in a time limit of 20 minutes. Actual word for word transcription will be required.

16050

CHAPTER I

Objective: The student will be able to spell and read aloud without hesitation to the teacher the words of the recall chart in Lesson 6, Chapter I. The student will then be able to transcribe a 50-word test including words, brief forms, and phrases with a maximum of ten errors in 20 minutes. The student will also be able to transcribe a paragraph chosen by the teacher from practiced material in Lesson 6 with a maximum of ten errors.

The teacher will present on the board the shorthand alphabet letters presented in Lesson 1 and the punctuation marks. You will spell and read aloud as the teacher presents.

Assignment I. Spell and read aloud to yourself all words in lesson 1 at least three times. Cover the longhand with your hand or paper while you read the shorthand characters. You must be able to read page 20 without hesitation.

The teacher will review the alphabet strokes of Lesson 1 on the board, having you spell and read aloud. She will review all of Lesson 1 with you and the other students reading in concert. The teacher will then present the new strokes of Lesson 2 on the board, having you spell and read aloud.

Assignment 2. Spell and read aloud Lesson 1 and 2, covering the longhand. Be able to read page 23 without hesitation.

The teacher will review all alphabet strokes learned so far on the board. The first brief forms will be presented and an explanation given about them. The new alphabet strokes in Lesson 3 will be presented on the board with you spelling and reading from the board.

Assignment 3. Sight read brief forms three times, covering up the longhand with a piece of paper. Spell and read aloud three times all of the words in Lesson 3. Spell and read all of the connected matter in Lesson 3 three times or until it can be read without hesitation.

A complete review and drill of Lessons 1, 2, and 3 will be given by the teacher with you participating.

Assignment 4. Spell and read all words and all connected matter in Lessons 1, 2, and 3. You must be able to sight read the brief forms on page 24 without hesitation.

The teacher will review and drill all alphabet strokes learned thus far. The new strokes of Lesson 4 will be presented on the board to you.

Assignment 5. Spell and read three times all theory in Lesson 4, covering up the longhand. Read all the sentences aloud in the reading practice, spelling out each outline that you cannot read immediately. Do this until you can read these sentences without hesitation.

16051

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: IX. CHASSIS

MILESTONE: III. FRONT SUSPENSION

PERFORMANCE OBJECTIVE NO.: 3 TITLE: Alignment

CONDITIONS:

This assignment will be performed on a complete automobile, using a drive-on type aligning equipment.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Obtain instruction manual on equipment to be used
5. Select proper tools and materials
6. Set camber following all steps as outlined in the manual
7. Set caster following all steps as outlined in the manual
8. Set toe end following all steps as outlined in the manual
9. Recheck all settings and if they are satisfactory, return tools and materials to proper place
10. Return automobile to proper parking area
11. Remove front seat covers and store in proper place
12. Clean work station for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily align the front suspension in 3 hours.

1600

Learning time: 7 hours

The teacher will review and drill all shorthand strokes and brief forms learned thus far. The new strokes and brief forms in Lesson 5 will be presented to you.

Assignment 6. Spell and read three times all theory in Lesson 5 covering up the longhand. Memorize the brief forms in paragraph 27 until you can sight read them without hesitation. Read all of the reading practice aloud in Lesson 5 until you can read without hesitation. Spell out each outline you cannot read immediately.

The teacher will review and drill all strokes and brief forms learned thus far. Rules in Lesson 6 will be discussed and a presentation of the recall chart, No 39 will be given. The teacher will introduce writing.

Assignment 7. Write all theory (words) three times each that have been presented in Lessons 1 through 5. Spell and read aloud all words in the recall chart, page 38, and sight read brief forms and phrases. Read all the connected matter once. Hand your assignment to the teacher at the beginning of the next class.

The teacher will review the recall chart in Lesson 6 and the reading practice.

Assignment 8. Write the recall chart, page 38, (words, brief forms, and phrases) each once and transcribe them on longhand. Be able to read all the reading practice in Lesson 6 without hesitation. Hand in your assignment. Be prepared for a test on Lesson 6.

At this point a test will be given to you on Lesson 6, consisting of theory vocabulary transcription and paragraph transcription.

If you were able to pass this test in 20 minutes with no more than ten errors, you are ready to proceed with Chapter II.

16052

Shorthand I
(First Semester)

CHAPTER II

Objective: The student will be able to transcribe 50 words taken from the brief forms, words, phrases and amounts of the recall chart in Lesson 12 with a maximum of 10 errors in 30 minutes. The student will also be able to transcribe a paragraph chosen by the teacher from Lesson 13 with a maximum of ten errors in 20 minutes. The student will also be able to pass a brief form test on all brief forms covered up to Lesson 13 with 95% accuracy in five minutes.

The teacher will introduce Chapter II and Lesson 7. She will present the new theory and discuss the business vocabulary terms.

Assignment:

1. Spell and read the theory. Write the theory at least three times or until you can write it without looking at the book.

2. Read all of the reading and writing practice. If you come to a word you cannot read, spell it in shorthand. If you still cannot read it, write the word on a piece of paper. When you have completed this reading, check with the teacher for the meaning of the words you cannot read.

3. Copy #48 and #52. (Keep in mind that while you are copying this shorthand you should be able to read your own notes.)

When you have completed Lesson 7, have the teacher check your notebook. She will test you to know how well you know this material.

The teacher will introduce Lesson 8. She will present the new theory and the new brief forms. She will also discuss and explain #56, Business Vocabulary Builder.

Assignment:

1. Spell and read the theory. Write all of the theory at least three times or until you can write it without looking at the book. Sight read the brief forms. Learn the brief forms so that you can say them and write them without hesitation.

2. Read all of the reading and writing practice. If you come to a word you cannot read or spell out in shorthand, write it on a piece of paper. When you complete this lesson, ask the teacher for the meanings of the outlines you cannot read.

3. Copy #57, 58, 59, 60, and 61 of Lesson 8.

When you have completed this lesson, have your teacher check your notebook. She will test you as to how well you know this material.

16053

The teacher will review and dictate the brief forms. She will also review and dictate some material from Lesson 8. The theory of Lesson 9 will be presented to you.

Assignment:

1. Write the theory at least three times or until you can write it without looking at the book.

2. Review the Business Vocabulary Builder, #66.

3. Spell and read all of the reading and writing practice. Remember and follow the previous instructions on words you cannot immediately spell and read.

4. Copy #67,68,69, and 70.

5. Be prepared at any time to read to your teacher from this lesson or any previous lesson.

6. Practice and know how to write the following words.

day he me go ship

When you have completed this lesson, check with your teacher.

The teacher will review the theory of Lesson 9. She will present the theory of Lesson 10. Some new matter dictation will be introduced to you at this time.

Assignment:

1. Write the theory at least three times or until you can write it without looking at the book.

2. Review the Business Vocabulary Builder, #74.

3. Spell and read all of the reading and writing practice. Any words you cannot immediately spell and read, write them on a piece of paper.

4. Copy #75,76,77,78, and 79.

5. Be prepared at any time to read to your teacher any material from this lesson or any previous lesson.

6. Practice and know how to write the following words:

day Ray open I will be to go will not be he

160541

ship store right he will not have I am going

will not be it will be

The teacher will review some material from Lesson 10. Brief forms will also be reviewed. The theory of Lesson 11 will be presented to you. The new brief forms will be introduced. The teacher will dictate from a paragraph from lesson 10 and also dictate some new matter dictation.

Assignment;

1. Write the theory at least three times or until you can write it without hesitation.

2. Review the Business Vocabulary Builder, #85.

3. Read all of the reading and writing practice.

4. Copy #86, 87, 88, and 89.

5. Be prepared at any time to read to your teacher from any material presented up to this time.

6. Be able to write the following words:

data day team need sailing here or go

The teacher will review and dictate the brief forms to you. Dictation from a paragraph in Lesson 11 will be given. Lesson 13 will be introduced. New matter dictation will be given.

Assignment:

1. Read #95, Recall Chart. Write each shorthand outline once and transcribe it into longhand at the side of the shorthand outline.

2. Read all of the reading and writing practice.

3. Copy #97, 98, 99, and 100.

4. Review the Business Vocabulary Builder, #96.

5. Be prepared for a test on Lesson 13 and also a test on all brief forms covered up to this time.

16055

At this point a test will be given to you on Lesson 12 consisting of theory vocabulary transcription and connected matter. A brief form test will also be given at this time. The brief form test will be dictated and both shorthand outline and transcription will be checked.

If you were able to pass the theory vocabulary transcription in 20 minutes with no more than 10 errors, the transcription of the connected matter in 20 minutes with no more than 10 errors, and the brief form test with 95% accuracy in 5 minutes, you are ready to proceed with Chapter III.

16056

CHAPTER III

Objective: The student will be able to transcribe 50 words taken from the brief forms, words, phrases and amounts of the recall chart in Lesson 18 with a maximum of 10 errors in 30 minutes. The student will be able to transcribe some connected matter chosen by the teacher from Lesson 18 with a maximum of 10 errors in 20 minutes. The student will be able to take from dictation a brief form test of 25 words and transcribe it in 5 minutes with 95% accuracy.

The teacher will introduce Chapter III and Lesson 13. She will present the new theory and the brief forms. New Matter dictation will be given. Be able to write the following words:

Ray day May he will not be it will if you can

he go ship right please

Assignment:

1. Write all of the theory at least three times or until you can write it without looking at the book. Memorize the brief forms so that you can write them without hesitation.

2. Review the business Vocabulary Builder, #104.

3. Read all the reading and writing practice. Spell any words that you cannot immediately sight read. Write the words you cannot spell and read on a piece of paper.

4. Copy #105, 106, 107, 108, 109, and 110.

Be prepared to read to your teacher at any time from this lesson or any previous lesson.

5. Practice and know how to write the following:

day May 5 o'clock or before it will not be

I am he go ship

The teacher will review and dictate brief forms to you. She will also review the theory of Lesson 13. Some dictation from your lesson may be given at this time. The teacher will present Lesson 14 and some new matter dictation will be given.

16028

16057

Assignment:

1. Write all theory at least three times or until you can write it without looking at the book.

2. Review the Business Vocabulary Builder, #115.

3. Read all of the reading and writing practice, spelling all words you cannot sight read.

4. Copy #116, 117, 118, and 119.

5. Transcribe #116.

6. Be prepared to read to your teacher any material covered up to the present time.

7. Practice and be able to write the following words:

May here get goods me Erie pay pleased

pleased my your letter you should have I desire

will you with your if you will I think I was

Hear from you by the write store end let bill

The teacher will review Lesson 14 and introduce the theory and brief forms presented in Lesson 15. New Matter dictation will be given.

Assignment:

1. Read all the theory and then write all the theory at least three times. Memorize the brief forms, #120, and be able to write them without hesitation when dictated.

2. Review the Business Vocabulary Builder, #124.

3. Read all of the reading and writing practice, spelling out the words you cannot immediately sight read.

4. Copy #125, 126, 127, and 128.

5. Transcribe #125.

16058

6. Be prepared to read to your teacher at any time.

7. Practice and know how to write the following words:

meeting me know my same day it will be to go

to the to be 3 o'clock let desire ship

The teacher will review Lesson 15 and dictate the brief forms to you. She will also present Lesson 16. Some dictation from the book may be given and new matter dictation will be presented.

Assignment:

1. Read all the theory and write the theory at least three times.

2. Review the Business Vocabulary Builder, #133, and the Up and Down Check List on page 89.

3. Read all of the reading and writing practice.

4. Copy #134, 135, 136, and 137.

5. Transcribe #138.

6. Be prepared to read to your teacher at any time from this lesson or any previous lesson.

Practice and know how to write the following words:

May before 2 o'clock day Erie will be should be

I would like to go to be ship please then

At this point you should review the following and make sure you know and can say them without hesitation.

Alphabet Sounds

16059
16028

Word Endings

ing
ly
ed

tion, tial
cient
ciency

ble

Word Beginnings

be

The teacher will review Lesson 16 and present Lesson 17 to you. Some dictation will be given to you.

Assignment:

1. Read the theory and write the theory at least three times. Memorize the brief forms, #139, and be able to read and write them without hesitation when dictated.

2. Review #142, Business Vocabulary Builder.

3. Review #143, Similar-Words Drill. Read carefully the definitions and the illustrative sentences.

4. Read all of the reading and writing practice.

5. Copy #144, 145, 146, 147, 148, and 149.

6. Transcribe #144.

7. Be prepared to read to your teacher at any time.

8. Practice and know how to write the following words:

get rate pay cash data me Erie May you

you should have that will you like to pay I desire

I am going market all like desire then

The teacher will review Lesson 17 and introduce Lesoon 18 to you. Some dictation will be given to you both from the book and from new material.

16060

Assignment:

1. Read all of the Recall Chart, #154. Write each outline once and transcribe it in longhand at the side of the shorthand outline.

2. Read all of the reading and writing practice. Time yourself and determine your reading rate from the table on page 98.

3. Copy #156 and 157.

4. Review #155, Business Vocabulary Builder.

5. Be prepared for a test on Lesson 18 and also a test on all brief forms covered so far.

At this point a test will be given to you on Lesson 18, consisting of theory vocabulary transcription and connected matter transcription. A brief form test will also be given at this time. The brief form test will be dictated and both the shorthand outline and the transcription will be checked.

If you were able to pass the theory vocabulary transcription in 20 minutes with no more than 10 errors, the transcription of the connected matter in 20 minutes with no more than 10 errors, and the brief form test in 5 minutes with 95% accuracy, you are ready to proceed with Chapter IV.

16061

Shorthand I
(First Semester)

CHAPTER IV

Objective: The student will be able to transcribe 50 words taken from the words, brief forms, and phrases of the recall chart in Lesson 24 with a maximum or 10 errors in 20 minutes. The student will be able to transcribe some connected matter chosen by the teacher from Lesson 24 with a maximum of 10 errors in 20 minutes. The student will also be able to take from dictation a brief form test of 25 words and transcribe it in 5 minutes with 95% accuracy.

The teacher will introduce Chapter IV and Lesson 19 to you. She will present the new theory and brief forms. New Matter Dictation will be given. Practice and know how to write the following words:

case came 5 o'clock made home day people

settle letter desire

Assignment:

1. Read all the theory. Write all the theory at least three times. Memorize the brief forms so that you can write them and read them without hesitation.

2. Review #161, Business Vocabulary Builder.

3. Read all of the reading and writing practice.

4. Copy #162, 164, and 165.

5. Transcribe #162.

6. Be prepared to read to your teacher at any time.

Practice and know how to write the following words:

me Day May need 5 o'clock Erie to go

he will be able to see to have If you can hear from you

Dr... let letter please

The teacher will review Lesson 19 and present Lesson 20. Some dictation from Lesson 19 will be given and also some new matter dictation.

16063

16062

Assignment:

1. Write all of the theory at least three times.

2. Review the Business Vocabulary Builder, #172.

3. Read all of the reading and writing practice.

4. Copy #173, 174, 175, 176, and 177.

5. Transcribe #175.

6. Be prepared to read to your teacher at any time.

7. Practice and know how to write the following words:

help pay fee before plan I should like

if you can if you will write I shall have market

The teacher will review the theory of Lesson 20 and present Lesson 21. Some dictation from material in Lesson 20 will be given to you and some new matter dictation will be presented.

Assignment:

1. Read all of the theory and write the theory at least three times. Memorize the brief forms so that you can write them without hesitation when dictated.

2. Review the Business Vocabulary Builder, #182.

3. Copy #183, 184, 185, 186, and 187.

4. Transcribe #183.

5. Be prepared to read to your teacher at any time.

6. Practice and know how to write the following words:

meeting here people Dean late get begin

stay tea then all

The teacher will review the theory of Lesson 21. A review of all brief forms will be given and Lesson 22 will be presented. Some dictation will be given to you at this time.

16063

Assignment:

1. Read the theory and write all of the theory at least three times.

2. Review the Business Vocabulary Builder, #194, and the Proportion Check List on page 124.

3. Read all of the reading and writing practice.

4. Copy #195, 196, 197, and 198.

5. Transcribe #195.

6. Be prepared to read to your teacher at any time.

7. Practice and know how to write the following words.

January came doing thank you for your letter please

it will be there has been about this week write

necessary most matter long keep side market

The teacher will review the theory of Lesson 22 and present Lesson 23. Dictation from Lesson 22 will be given as well as new matter dictation.

Assignment:

1. Read all of the theory and write all the theory at least three times. Memorize the brief forms so that you can write them without hesitation when dictated.

2. Review #203, Business Vocabulary Builder, and #204, Similar-Words Drill.

3. Read all of the Reading and Writing Practice.

4. Copy #205, 206, 207, and 208.

5. Transcribe #205.

6. Review the Writing Tool Check List on the bottom of page 129.

7. Be prepared to read to your teacher at any time.

16064

8. Practice and know how to write the following words:

without fail Monday January November December

late taken care once help desire necessary

like bill matter

The teacher will review Lesson 23 and introduce lesson 24. A review of the brief forms will be given. Dictation from Lesson 23 will be given as well as some new matter dictation.

Assignment:

1. Read the Accuracy Practice and do the practice drills #209 and 210.

2. Read all of the Recall Chart #211. Write each outline once and transcribe it in longhand at the side of the shorthand outline.

3. Read all of the Reading and Writing Practice.

4. Copy #213 and 214.

5. Review the Business Vocabulary Builder, #212.

6. Be prepared for a test on Lesson 24 and also a test on all brief forms covered so far.

At this point a test will be given to you on Lesson 24, consisting of theory vocabulary transcription and connected matter transcription. A brief form test will also be given at this time. The brief form test will be dictated and both the shorthand outline and the transcription will be checked.

If you were able to pass the theory vocabulary transcription in 20 minutes with no more than 10 errors, the transcription of the connected matter in 20 minutes with not more than 10 errors, and the brief form test in five minutes with 95% accuracy, you are ready to proceed with Chapter V.

16065 16064

Shorthand I
(First Semester)

CHAPTER V

Objective: The student will be able to transcribe on the typewriter 50 words taken from the brief forms and words of the recall chart in Lesson 30 with a maximum or ten errors in 20 minutes. The student will be able to transcribe on the typewriter some connected matter chosen by the teacher from Chapter V with a maximum of ten errors in 20 minutes. The student will also be able to take from dictation a brief form test of 25 words and transcribe it in five minutes with 95% accuracy.

The teacher will introduce Chapter V and Lesson 25 to you. She will present the new theory and brief forms. Some new matter dictation will be given. Practice and know how to write the following words.

head know store did market desires all

write letter like

Assignment:

1. Read all of the theory. Write all of the theory at least three times. Memorize the brief forms so that you can read them without hesitation and write them from dictation without hesitation.

2. Review #218, Business Vocabulary Builder.

3. Read all of the reading and writing practice.

4 Copy #219,220, and 221. Be sure that you can read your own shorthand notes.

5. Transcribe #219.

6. Be prepared to read to your teacher at any time.

7. Practice and know how to write the following words:

Erie meeting come most long letter date

believe all like

The teacher will review Lesson 25 and present Lesson 26 to you. The brief forms will also be reviewed. Dictation from Lesson 25 will be given and also some new matter dictation.

16066

Assignment:

1. Write all of the theory at least three times.

2. Review the Business Vocabulary Builder, #228.

3. Read all of the reading and writing practice.

4. Copy #229, 230, 231, 232, and 233. Be sure you can read your own notes.

5. Transcribe #232.

6. Be prepared to read to your teacher at any time.

7. Practice and know how to write the following words:

before Main plans taken care Monday property

desire matter office more week enable

individual let want matter unable

The teacher will review Lesson 26 and present Lesson 27. The new brief forms will be introduced. Some dictation from Lesson 26 will be given and also some new matter dictation.

Assignment:

1. Write all the theory at least three times. Memorize the brief forms and be able to read and write them without hesitation.

2. Review the Business Vocabulary Builder, #238.

3. Read all of the reading and writing practice.

4. Copy #239, 240, 241, and 242. Be sure that you can read from your own notes.

5. Transcribe #239.

6. Be prepared at any time to read to your teacher.

7. Practice and know how to write the following words:

October November paid things $10 do before

16067

if you can we have to keep this matter please

return bill date want week most side

The teacher will review Lesson 27 and present Lesson 28. The brief forms of Lesson 27 will also be reviewed. Some dictation from Lesson 27 will be given and also some new matter dictation.

Assignment:

1. Copy all of the theory at least three times.

2. Review the Business Vocabulary Builder, #248.

3. Read all of the reading and writing practice.

4. Copy #249, 250, 251, and 252.

5. Transcribe #250.

6. Be prepared to read to your teacher at any time.

7. Practice and know how to write the following words:

know Main Saturday February money $5,000

papers come get Philadelphia data property

market

The teacher will review Lesson 28 and present Lesson 29. New brief forms will also be presented. Dictation from Lesson 28 will be given and also some new matter dictation.

Assignment:

1. Write all of the theory at least three times. Memorize the brief forms so that you can read and write them without hesitation.

2. Review the Business Vocabulary Builder, #257, and the Similar-Words Drill, #258.

16068

3. Read all of the reading and writing practice.

4. Copy #259, 260, 261, and 262.

5. Copy #259.

6. Be prepared to read to your teacher at any time.

7. Practice and know how to write the following words:

told overdue since step action cash once

items fail plans summer usual necessary

sale remittance

The teacher will review Lesson 29 and present Lesson 30. She will also review the brief forms. Some dictation from Lesson 29 will be given and also some new matter dictation.

Assignment:

1. Read the Accuracy Practice and do the accuracy drills #262, 264, and 265.

2. Read all of the recall chart, #266. Write each outline once and transcribe it in longhand at the side of the shorthand outline.

3. Read all of the reading and writing practice. Time yourself and determine your reading rate from the table on page 167.

4. Review the Business Vocabulary Builder, #267.

5. Be prepared for a test on Lesson 30 and also a test on all brief forms covered so far.

At this point a test will be given to you on Chapter V, consisting of theory vocabulary transcription and connected matter transcription. A brief form test will also be given at this time. The brief form test will be dictated and both the shorthand outline and the transcription will be checked.

If you were able to pass the theory vocabulary transcription in 20 minutes with no more than 10 errors, the transcription of the connected matter in 20 minutes with no more than 10 errors, and the brief form test in five minutes with 95% accuracy, you are ready to proceed with Chapter VI.

1009 83031

Shorthand I
(First Semester)

CHAPTER VI

Objective: The student will be able to transcribe 50 words taken from the brief forms, words, and phrases in Lesson 36 with a maximum of 10 errors in 20 minutes. The student will be able to transcribe some connected matter chosen by the teacher from Chapter VI with a maximum of 10 errors in 20 minutes. The student will also be able to take from dictation a brief form test of 25 words and transcribe it in five minutes with 95% accuracy.

From this point on, you should be prepared each day to take from dictation 10 to 25 words that have been selected from your lesson. These words will be taken from the theory and also from the reading and writing practice. These words will be dictated in no more than 45 seconds and must be transcribed in no more than a minute and a half to two minutes.

The teacher will introduce Chapter VI and Lesson 31 to you. She will present the new theory and new brief forms. Some new matter dictation will be given. Practice and know how to write the following words:

Philadelphia	sale	form	30 per cent	off	decide

coats	suits	dresses	office

Assignment:

1. Copy all of the theory at least three times. Memorize the brief forms so that you can read and write them without hesitation.

2. Review thoroughly the Punctuation Practice, #272. Find the errors in the letter on page 173 and make sure that you insert and encircle all commas in your shorthand notes just as they are in the textbook.

3. Review the Business Vocabulary Builder, #273.

4. Read all of the Reading and Writing Practice.

5. Copy #274, 275, 276, and 277.

6. Transcribe #274.

7. Be prepared to read to your teacher at any time.

8. Practice and know how to write the following words:

December	sets	books	received	anything	help

NATIONAL BUREAU OF STANDARDS-1963-A

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: IX. CHASSIS

MILESTONE: IV. WHEELS, HUBS, AND DRUMS

PERFORMANCE OBJECTIVE NO.: 4 TITLE: Changing Tires

CONDITIONS:

This assignment will be performed on a tubeless tire and wheel obtained from the parts storage room.

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Obtain a tire and wheel from the parts storage room
2. Select proper manual and turn to appropiate chapter
3. Select proper tools and materials
4. Mount tire and wheel on tire changer following all steps as outlined in the manual
5. Remove tire from wheel following all steps as outlined in the manual
6. Perform all tests and checks as outlined in the manual
7. Mount tire on wheel following steps as outlined in manual
8. Inflate tire to proper pressure and perform leakage checks and tests
9. If all checks and tests are satisfactory, deflate tire and return tire and wheel to storage room
10. Return tools and materials to proper place
11. Clean work station for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily remove, test, and replace tire on wheel in 30 minutes.

Learning time: 2 hours

individual

The teacher will review Lesson 31 and give a review of the new brief forms learned. She will present Lesson 32. Some dictation from Lesson 31 will be given as well as some new matter dictation.

Assignment:

1. Copy the theory at least three times.

2. Review the Business Vocabulary Builder, #282.

3. Review #283, Punctuation Practice, and make sure you know the meaning of apposition.

4. Read all of the reading and writing practice.

5. Copy #284.

7. Review the personal-use check list on page 184.

8. Practice and know how to write the following words:

records just enough wool April booklet number

visit credit arranged purchases

The teacher will review Lesson 32 and present Lesson 33. Some new brief forms will be presented. Some dictation will be given from Lesson 32 plus some new matter dictation.

231 16071 16070

Assignment:

1. Write the theory at least three times. Memorize the brief forms so that you can read and write them without hesitation.

2. Review the Business Vocabulary Builder, #293.

3. Review the Punctuation Practice, #294. Be sure you understand how to place commas in a series.

4. Read all of the reading and writing practice.

5. Copy #295, 296, 297, and 298.

6. Transcribe #295.

7. Practice and know how to write the following words:

June July unsatisfactory away up difference

missed meaning my given mine considered

The teacher will review Lesson 33 and present Lesson 34. She will also give a quick review of the new brief forms. Some dictation from Lesson 33 will be given as well as some new matter dictation.

Assignment:

1. Copy all the theory at least three times.

2. Review the Business Vocabulary Builder, #303.

3. Read all of the reading and writing practice.

4. Transcribe #304.

5. Practice and know how to write the following words:

list since received look into fill better

soon grade

The teacher will review Lesson 34 and introduce Lesson 35. Some dictation from Lesson 34 will be given as well as some new matter dictation.

Assignment:

1. Copy all of the theory at least three times.

2. Review the Business Vocabulary Builder, #311.

3. Review the Similar-Words Drill #312.

4. Read all fo the Reading and Writing Practice.

5. Copy #313, 314, 315, and 316.

6. Transcribe #313.

7. Review the Shorthand Notebook Check List on the bottom of page 199.

8. Practice and know how to write the following words:

received come days delay unsatisfactory money

back details will you has not been I have

for many years as you know more than as soon as write

in this matter purchased usual consider please

At this point you should review the following and make sure you know and can say and write them without hesitation.

The teacher will review Lesson 35 and introduce Lesson 36. Some dictation from Lesson 35 will be given as well as some new matter dictation.

Assignment:

1. Review #317, Principles of joining.

2. Review #318, Accuracy Practice, and do all of the practice drills, #318, 319, and 320.

3. Read all of the recall chart, #321. Write each outline once and transcribe it in longhand at the side of the shorthand outline.

4. Review #322, Business Vocabulary Builder.

5. Read all of the reading and writing practice.

6. Be prepared for a test on Lesson 36 and also a test on brief forms covered so far.

At this point a test will be given to you on Lesson 36, consisting of theory vocabulary transcription and connected matter transcription. A brief form test will also be given at this time. The brief form test will be dictated and both the shorthand outline and the transcription will be checked.

If you were able to pass the theory vocabulary transcription on 20 minutes time with no more than 10 errors, the transcription of the connected matter in 20 minutes with no more than 10 errors and the brief form test in five minutes with 95% accuracy, you are ready to proceed with Chapter VII.

Shorthand I
(First Semester)

CHAPTER VII

Objective: The student will be able to transcribe 50 words taken from the word beginnings and endings in Lesson 42 with a maximum of 10 errors in 20 minutes. The student will be able to transcribe some connected matter chosen by the teacher from Chapter VII with a maximum of 10 errors in 20 minutes. The student will also be able to take from dictation a brief form test of 50 words and transcribe it in 10 minutes with 95% accuracy.

The teacher will present Lesson 37 to you. Some new matter dictation will be given. Practice and know how to write the following words:

wrote done well place credit waiting purchase

Assignment:

1. Copy all of the theory at least three times.

2. Review the Business Vocabulary Builder, #331.

3. Review the Punctuation Practice, #332. Make certain you understand the meaning of the "if" clause.

4. Read all of the Reading and Writing Practice.

5. Copy #333, 334, 335, and 336.

6. Transcribe #334.

7. Practice and know how to write the following words:

proud rated credit Philadelphia traded unite

few possible believe individuals always market

The teacher will review Lesson 37 and present Lesson 38. Some dictation from Lesson 37 will be given as well as some new matter dictation.

Assignment:

1 Copy all of the theory at least three times.

2. Review the Business Vocabulary Builder, #340.

3. Review #341, Punctuation Practice, and be sure you know the meaning of the "as" clause.

16075

4. Read all of the reading and writing practice.

5. Copy #342, 343, 344, and 346.

6. Transcribe #344.

7. Practice and know how to write the following words:

workers eager know 500 suits ready way

manager return unable

The teacher will review Lesson 38 and present the new theory in Lesson 39. Some dictation from Lesson 38 will be given as well as new matter dictation.

Assignment:

1. Copy the theory at least three times. How are you doing with your word lists that are dictated each day? If you are having problems, you are not studying your theory enough.

2. Review the Business Vocabulary Builder, #351.

3. Review #252, Punctuation Practice. Be sure you understand the use of the comma with the "when" clause.

4. Read all of the reading and writing practice.

5. Copy #353, 354, 355, 356, and 357.

6. Transcribe #354.

7. Practice and know how to write the following words:

speaker last decide several years ago in which

very good has not been would be of the time do you think

should be has made during the past if you can remember

wanted always write

16076

The teacher will review Lesson 39 and present Lesson 40. Some dictation from Lesson 39 will be given as well as some new matter dictation.

Assignment:

1. Copy all of the theory at least three times.

2. Review the Business Vocabulary Builder, #359.

3. Review the Punctuation Practice #360. Be sure you understand the "introductory" comma.

4. Read all of the reading and writing practice.

5. Copy #361, 362, and 363.

6. Transcribe #363.

7. Practice and know how to write the following words:

touch customers way sustain friendship department

written history seldom another choose items

The teacher will review Lesson 40 and introduce Lesson 41. Some dictation from Lesson 40 will be given as well as some new matter dictation.

Assignment:

1. Copy all of the theory at least three times.

2. Review the Business Vocabulary Builder, #369.

3. Review the Similar Words Drill, #370.

4. Read all of the reading and writing practice.

5. Copy #371, 372, 373, 374, and 375.

6. Transcribe #373.

7. Practice and know how to write the following words:

Jones neighbor kind standing ways looking

16077

entire line ready purchase reference consider

The teacher will review Lesson 41 and present Lesson 42. Some dictation from Lesson 41 will be given as well as new matter dictation.

Assignment:

1. Read all of the Accuracy Practice and do the accuracy drills #376, 377, and 378.

2. Read all of the Recall Chart, #379. Write each outline once and transcribe it in longhand at the side of the shorthand outline.

3. Review the Business Vocabulary Builder, #380.

4. Read all of the reading and writing practice. Time yourself and determine your reading rate from the table on page 237.

5. Copy #381.

6. Be prepared for a test on Lesson 42 and also a test on all the brief forms.

At this point a test will be given to you on Lesson 42, consisting of theory vocabulary transcription and connected matter transcription. A brief form test will also be given at this time. The brief form test will be dictated and both the shorthand outline and the transcription will be checked.

If you were able to pass the theory vocabulary transcription in 20 minutes with no more than 10 errors, the transcription of the connected matter in 20 minutes with no more than 10 errors, and the brief form test in ten minutes with 95% accuracy, you are ready to proceed with Chapter VIII.

16078

Shorthand I
(First Semester)

CHAPTER VIII

Objective: The student will be able to transcribe 50 words taken from the words and phrases in Lesson 48 with a maximum of 10 errors in 20 minutes. The student will be able to transcribe some connected matter chosen by the teacher from Chapter VIII with a maximum of 10 errors in 20 minutes. The student will also be able to take from dictation a brief form test of 50 words and transcribe it in 10 minutes with 95% accuracy.

The teacher will introduce Lesson 43 to you at this time. Some new matter dictation will be given. Practice and know how to write the following words:

book ownership new needed receive classes

copies purchased property consider necessary

Assignment:

1. Copy all of the theory at least three times.

2. Review #386, Business Vocabulary Builder.

3. Review #387, Punctuation Practice. Be certain that you understand the "conjunction" comma.

4. Read all of the reading and writing practice.

5. Copy #388, 389, 390, and 391.

6. Transcribe #391.

7. Practice and know how to write the following words:

notification enterprise program location to be

to come to this in order sending them you should

you will see consider individual want purchase

The teacher will review Lesson 43 and present Lesson 44. Some dictation from Lesson 43 will be given to you as well as some new matter dictation.

16079

16080

Assignment:

1. Copy all of the theory at least three times.

2. Review the Business Vocabulary Builder, #397.

4. Read all of the reading and writing practice.

5. Copy #398, 399, 400, and 401.

6. Transcribe #401.

7. Read the spelling and Punctuation Check List at the bottom of page 251.

8. Practice and know how to write the following words.

realize standing open another shipment attorney

remittance purchased necessary

The teacher will review Lesson 44 and introduce Lesson 45. Some dictation from Lesson 44 will be given as well as some new matter dictation.

Assignment:

1. Copy all of the theory at least three times.

2. Review the Business Vocabulary Builder, #406.

3. Review thoroughly the Spelling Families, #407.

4. Read all of the reading and writing practice.

5. Copy #408, 409, 410, and 411.

6. Transcribe #409.

7. Read the homework check list at the bottom of page 257. You are supposed to be doing all of these items as you do your homework.

8. Practice and know how to write the following words:

December October receipt November accounts necessary

8. Practice and know how to write the following words:

Fred Philadelphia trip interesting divide places

simple dresses better parties Friday morning

it will not I suggest that you would like let property

The teacher will review Lesson 47 and present Lesson 48. Some dictation from Lesson 47 will be given as well as new matter dictation.

Assignment:

1. Read all of the Accuracy Practice and do the accuracy drills #430 and 431.

2. Read all of the Recall Chart, #432. Write each outline once and transcribe it in longhand at the side of the shorthand outline.

3. Review the Business Vocabulary Builder, #433.

4. Read all of the reading and writing practice.

5. Copy #434 and 435.

6. Be prepared for a test on Lesson 48 and also a test on all the brief forms.

At this point a test will be given to you on Lesson 48, consisting of theory vocabulary transcription and connected matter transcription. A brief form test will also be given at this time. The brief form test will be dictated and both the shorthand outline and the transcription will be checked.

If you were able to pass the theory vocabulary transcription in 20 minutes with no more than 10 errors, the transcription of the connected matter in 20 minutes with no more than 10 errors, and the brief form test in 10 minutes with 95% accuracy, you are ready to proceed with Chapter IX.

16082

CHAPTER IX

Objective: The student will be able to pass a brief form and derivatives test consisting of 50 words and transcribe it in 10 minutes with 95% accuracy checking both the shorthand and transcription. The student will also be able to take from dictation at 40 wpm one of the letters from Lesson 56 and transcribe it in 20 minutes with a maximum of 10 errors.

You have now completed the theory portion of Gregg Shorthand. Chapter IX is reinforcement of brief forms and derivatives. Each lesson contains a review list of brief forms and derivatives and letters containing these same brief forms.

The following are the general instructions that should be followed for each lesson in Chapter IX (Lessons 49-56.)

Assignment:

1. Copy all of the brief forms and derivatives at the beginning of each lesson at least three times. Be sure that you are able to read your own notes.

2. Read all of the reading practice.

3. Copy all the letters in the lessons and pay particular attention to the Vocabulary Building, Grammar Checkups, and Similar Word Drills.

4. Transcribe the following letters in Chapter IX: #443, 451, 456,462,471,476,487, and 492.

5. Be prepared to take a brief form derivative test and a test consisting of a letter dictated at 40 wpm.

At this point a test will be given to you on Chapter IX. It will consist of a brief form and derivatives test consisting of 50 words. This will be dictated and both the shorthand outline and transcription will be checked. A letter chosen from Lesson 56 will also be dictated at 40 wpm.

If you were able to pass the brief form and derivative test in 10 minutes with 95% accuracy and the dictated letter at 40 wpm in 20 minutes with a maximum of 10 errors, you are ready to proceed with Chapter X.

16083

CHAPTER X

Objective: The student will reinforce the principles learned in the previous chapters. The student will be able to transcribe smoothly from his own shorthand notes and apply the nine uses of the comma that were introduced in Chapters VI, VII, and VIII.

Assignments:

1. Copy all letters in each lesson. Be sure to insert all punctuation. Be able to read your shorthand notes.

2. Check with your teacher after each lesson and she will tell you which letters you are to transcribe in that lesson.

3. Check your transcription with the key provided and hand it to your teacher. She will then give you further instructions.

4. Pay particular attention to the spelling families given in this chapter.

5. You have now completed your Gregg Shorthand theory. At this point you will be given a series of tests to determine whether or not you are ready to proceed to the next shorthand book.

TESTS

1. You will be given a 100-word theory test. (This test may be taken at any time after Chapter 8). It will be dictated in no more than 10 minutes, and you will be allowed 20 minutes for transcription. Words transcribed incorrectly and misspelled words will be counted as errors. Only the transcription will be checked. These words will cover all phases of shorthand theory. To pass this test you must attain at least 80% accuracy.

2. You will be given a dictated 50-word brief form test and allowed 10 minutes for transcription. Both shorthand and transcription will be checked. Each will be worth one point. Misspelled words will be counted as errors. To pass this test you must attain 95% accuracy.

3. You have been given dictation takes during the past semester. If you have passed at least three "takes" dictated at the rate of 40 wpm or more for three minutes on new, unpreviewed material and have transcribed the dictation with 95% accuracy in a time limit of 20 minutes, you have passed this part of the requirements for this semester.

SHORTHAND I
(2nd Semester)

Behavioral Objective:

At the end of the second semester:

1. The student will be able to pass two 100-word theory tests with at least 85% accuracy. Each 100 words will be dictated in no more than 10 minutes and will be transcribed in 20 minutes. Words transcribed incorrectly and misspelled words will be counted as errors. Only the transcription will be checked. The words will cover all phases of shorthand theory.

2. The student will be able to pass at least two 50-word brief form tests with 95% accuracy. The words will be dictated at the rate of one every 1 1/2 seconds and transcribed within a ten-minute time limit. Shorthand and transcription will be checked--each will be worth one point. Misspelled words will be counted as errors.

3. The student will be able to transcribe on the typewriter designated paragraphs from homework notes or dictated letters. She should be able to transcribe each shorthand outline accurately. This transcription should be set up on type paper using a 60- or 70-space line with double spacing and indented paragraphs. A maximum of three errors an assignment will be allowed to pass. A minimum of 15 transcripts will be required.

4. The student will be able to read from shorthand plates in the book without hesitation on studied material. She will be able to read new words through spelling the shorthand form using the shorthand alphabet.

5. The student will be able to take dictation at 60 words per minute for three minutes on new, unpreviewed material and transcribe the dictation with 95% accuracy in a time limit of 20 minutes. Actual word for word transcription will be required.

6. The student will be able to transcribe a dictated 50-word theory test with 85% accuracy in a 20-minute time limit. These words will be taken from the theory and marginal reminders in each chapter. The student will also be able to transcribe a dictated letter at 40 wpm. This will be taken from the chapter and must be transcribed in 20 minutes. A maximum of three errors will be allowed.

7. The student should be able to transcribe correctly from dictation all words in the theory, vocabulary builder, and marginal helps given in each lesson. From time to time word lists of 25 words will be given covering this material.

- - - -

During this semester's work your teacher will ask you to transcribe from your homework notes or from dictated material. In order to be able

16085

to transcribe accurately from your homework notes, care should be taken in writing each homework assignment. Be sure that you can read the material that you copy in these lessons so that you will be able to read and transcribe your own notes correctly.

Words will be dictated to you from time to time to transcribe. Study the theory review and marginal reminders in each lesson carefully because the words will be taken from them.

At the beginning of each chapter you will find a warmup phrase letter. You should read and copy the letter several times while working on this chapter. This phrase letter is a very good speed development letter. See how fast you can write it using all the phrases. This letter will be dictated to you several times as warmup and will be dictated at high speeds.

Each chapter will have a specific review on phrases, brief forms, word families, and word beginnings and endings. A thorough study of these words will enable you to increase your ability of writing unfamiliar words in your dictation. A grammar checkup, spelling pointers, and punctuation review are also included in each chapter.

Taped instruction will be used at various intervals. Follow the instructions given on the attached sheet as to the procedure for taped instruction.

Follow the listed instructions step by step to enable you to increase your ability to take dictation and to read your notes accurately. At any time that you have a question, do not hesitate to check with your teacher.

Chapter I

1. Take each lesson separately-a minimum of one lesson a day. You will not be required to have a regular homework assignment on weekends. However, if you need additional time on some of these lessons, the weekend could be used profitably. Also, if for any reason you get behind in your lessons (four per week), use the weekend to catch up.

2. Study the theory review in each lesson by reading the words as quickly as you can. Refer to the key for the words you cannot read. Copy the words and see if you can read them back from your own notes.

3. Study the vocabulary builders and similar-word drills carefully. These words will appear in the practice material and will help you in your transcription.

4. Read each letter and copy it at least once. At the end of the last lesson in each chapter you will find a secretarial hint called "The Secretary on the Job." These articles should be read carefully and copied. These are the same articles that you will be asked to transcribe in your transcription class.

16086

5. The transcription letter at the end of each lesson should be read carefully and punctuation inserted.

6. After you have copied each letter, try to read back from your notes. If you have difficulty reading your notes, you are not copying the material as you should. Take a little more time because copying will do you no good unless you can read your own work.

7. If a question arises in your mind at any time while doing these lessons, be sure to check with your teacher.

8. Each day you will be given specific material to read and transcribe. Also, vocabulary lists will be dictated daily.

9. On specified days you will complete your lesson through the use of tapes. Refer to your instruction sheet on tapes for directions.

10. At least one day a week will be set aside for "takes."

11. After you have completed each lesson in the chapter, check with your teacher and she will give you the chapter test.

12. After completing the chapter test, hand your papers to your teacher for checking. If you have passed the test within the prescribed standard, you will be allowed to go on to the next chapter.

Chapters II through XI

1. Follow the steps as outlined for Chapter I.

16087

INSTRUCTIONS FOR THE TEACHER

Type and transcription is set up to take one hour's time daily of a two-hour block with Shorthand I. If the two-hour block is not scheduled, the course can be a one-hour class daily, but only students who are registered in Shorthand I should be eligible for the class inasmuch as the transcription is correlated with the Shorthand I program.

Type and Transcription is written so that the student will begin transcription after successfully completing Chapter 3 in the Shorthand I book (Gregg Shorthand, D. J. Series). The student will work only on type production until this point is reached. When transcription is started, the teacher should check from time to time to make sure that the student is dividing his time between both type and transcription. The student should not be allowed to work on one area until it is completed before starting the other. It is very important that they work on both type and transcription. Because the transcription material is correlated with Shorthand I, the student will not be able to go beyond the point he has reached in his shorthand work.

The following books should be on a reference shelf available to the students as called for in their assignments:

Bell, Mary L. Speed Typing, Third Edition. Cincinnati: South-Western Publishing Company, 1958.

Bowman, Wallace B. Business Letter Typing. Cincinnati: South-Western Publishing Company, 1957.

Freeman, Louis. Guide to Typewriting. New York: Amsco School Publications, Inc., 1967.

House, Clifford R., and Samuel Skurow. Typewriting Style Manual, Seventh Edition. Cincinnati: South-Western Publishing Company, 1958.

Lessenberry, D. D., James T. Crawford, and Lawrence W. Erickson. 20th Century Typewriting, Eighth Edition. Cincinnati: South-Western Publishing Company, 1962.

Liguori, Frank E. Basic Typewriting Operations--Principles and Problems. Cincinnati: South-Western Publishing Company, 1965.

Lloyd, Alan C., John L. Rowe, and Fred E. Winger. Typing Power Drills, Second Edition. New York: McGraw-Hill, Inc., 1965.

Rowe, John L., and Faborn Etier. Typewriting Drills for Speed and Accuracy, Third Edition. New York: McGraw-Hill, Inc., 1966.

Rowe, John L., Alan C. Lloyd, and Fred E. Winger. Gregg General Typing 191 Series, Second Edition. New York: McGraw-Hill, Inc., 1967.

Rowe, John L., and Alan C. Lloyd. Gregg Typing. Second Edition, Complete Course. New York: McGraw-Hill, Inc., 1958.

16088

16088

Wanous, S. J. Statistical Typing with Tabulation Problems, Second Edition. Cincinnati: South-Western Publishing Company, 1956.

After the student has completed a typing unit and filled out the printed record form indicating the number of pages and points for that unit, the number of points received should be recorded as reference for both teacher and student. The points received on each test should be recorded and these points only should be considered in the grade evaluation. It should be remembered that the student's score on his first attempt on a test is the score used in determining his grade. If the standard is not reached on the first attempt, however, he must review the unit and retake the test before going on to the next unit.

In transcription a given number of passing assignments is required; however, all transcription assignments should be recorded. If the standard is not reached on an assignment, it is not necessary to repeat it unless at the end of the course the required number of passing assignments has not been reached.

In a program of this type after an assignment has been checked and returned to the student, it is necessary that these papers are handed back to the teacher for filing. This eliminates the possibility of assignments being circulated among the students. It also serves as a double check if questions arise as to whether the assignment has been completed or not. It is suggested that a file folder be made for each student in which to keep these papers.

The instruction sheets for each unit should be returned before a new unit is given to the student. This prevents circulation of the units and also unnecessary reproduction.

Progress reports are used for students to keep a record of their work. A duplicate of this is also used as a nine-week report to the parents. A copy of a suggested progress report for each semester is included. Note that each required assignment is included on the report and there is also a place for the signature of a parent.

NOTE: It should be remembered that the requirements for timed writings and transcription assignments are minimum. This represents the average or "C" performance. If more timed writings are passed, the "B" and "A" grade can be determined by the number above the minimum requirement and the student's base increase or speed.

All transcription assignments must be completed with the minimum of 18 passing. However, if more assignments are passed, the grade can be determined from the average of the highest 18 plus a bonus for the additional passed assignments.

16089

TYPE AND TRANSCRIPTION (1st Sem.)

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: X. SERVICING

MILESTONE: I. LUBRICATION

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Changing Oil and Grease

CONDITIONS:

This assignment will be performed on a complete automobile

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Raise hood
6. Place protective covers on fenders
7. Place hoist arms and raise automobile to comfortable working height
8. Drain engine oil following all steps as outlined in the manual. Replace and tighten plug
9. Change oil filter following steps as outlined in manual
10. On standard transmissions, check level of lubricant following all steps as outlined in the manual
11. Check lubricant level in the differential following all steps as outlined in the manual

PERFORMANCE CRITERIA:

Base	UNDER 30	31-40	41-50	51-60	61-70	71+
A	11	10	9	8	6	4
B	10	9	8	7	4-5	3
C	6-9	5-8	5-7	5-6	3	2
D	5	4	4	4	2	1
F	0-4	0-3	0-3	0-1	0	0

A base rate is determined for each student after a series of timed writings has been given. Each student has the opportunity to earn an "A" in speed regardless of his level of typing. Example: If a student's base rate is 54, he would earn an "A" in speed if he increases his net words per minute to a 62 in a five-minute timed writing with no more than five errors. (Errors are limited to one per minute).

16092

16093

SPECIAL SIGNS AND SYMBOLS[1]

Dash (--) Strike the hyphen twice; do not leave a space before or after the dash.

Exclamation Mark (!) Type the period, backspace, and type the apostrophe directly above the period.

Feet (') Use the apostrophe.

Inches (") Use the quotation marks.

Minutes (') Use the apostrophe.

Seconds (") Use the quotation marks.

Ditto (") Use the quotation marks centered under each word.

Multiplication Sign (x) Use the small letter x; leave a space before and after the sign.

Minus Sign (-) Use the hyphen; leave a space before and after the sign.

Plus Sign (+) Type the diagonal (/); backspace, and type the hyphen (-); leave a space before and after the sign.

Division Sign (÷) Type the hyphen, backspace, and type the colon; leave a space before and after the sign.

In Care Of Type the small "c," the diagonal, and the small "o" (c/o).

Caret (indicates an insertion). Type the diagonal (/) between the words where the insertion is to take place. Type the insertion on the line above.

Roman Numerals Use the capital letters I, V, X, L, C, D, M.

Equal Sign (=) Type the hyphen, backspace, turn the cylinder down slightly, and type the hyphen a second time. (Be sure to put the cylinder back in the original position). Leave a space before and after the sign.

Degree Sign (°) Roll the cylinder down a half line space and type the small "o" (88°). Some typewriters have half-space linespace regulators. If yours does not, use the ratchet release.

Superiors Type the number a half line space above (44^2).

Inferiors Type the number a half line space below (H_2O).

(First Semester)

TYPE

Performance Criteria:
At the conclusion of the first semester:

1. The student will be able to pass at least ten 5-minute timed writings with no more than one error per minute and increase his base words-per-minute rate according to the attached chart.

2. The student will be able to pass an objective test on basic typing techniques with 80% accuracy.

3. The student will be able to locate, erase, and correct all typing errors made.

4. The student will be able to complete the following production work as set up in each individual unit. After completion of the production unit a test (or tests) will be given. A total of 5 points will be given for each page of the test with one point deducted for each error (see evaluation page). A minimum of 5 points per page will be required to pass.

   a. Centering
   b. Rough Drafts
   c. Tabulation
   d. Manuscripts
   e. Business Letters

Text: 20th Century Typewriting, Eighth Edition, Complete Course. Lessenberry, Crawford, and Erickson. Cincinnati: South-Western Publishing Company, 1962.

Timed Writings

Timed writings will be given at least once a week. Timings will also be given on an individual basis when needed. The student will check his papers carefully and circle all errors. Papers that have no more than one error per minute will be considered as passing and will be handed in. The base rate for each student will be figured by the teacher, and the grading scale for these base rates is attached.

Each timed writing should be set up in the following manner:

1. Double space.
2. 70-space line or as directed.
3. Type the following in the upper left corner.

   Name
   Type and Transcription
   Semester 1
   Timed Writing

16095

4. Circle entire word where error appears.
5. Record words per minute and number of errors at the top of the page. Example: 50/4

Production

The production work will be done in individual units. The student will obtain each unit from the teacher in the order designated above.

Each student will evaluate his own work. After completing each assignment in the unit, check your paper with the key at the checking table. Evaluate your own work according to the attached sheet. Record the number of errors per page in the upper right corner of each sheet. If you do not understand any part of the lesson, be sure to check with your teacher so that she can go over it with you. It may be necessary to retype the lesson to make sure that you know how to do it.

Keep each assignment in the unit until the entire unit has been completed. After the unit is completed and checked, fill out the printed record sheet. Sample attached. This should be stapled on top of the completed unit and placed in the basket for checking. REMEMBER! Check your work carefully. Be certain that you understand and know how to set up each lesson in the unit because your grade for the unit will be determined from your test scores.

Drills

Each day the student will be expected to spend five minutes on drill work. These drills should help improve the student's speed and accuracy in typing.

Drills should be chosen according to the type of production work you are doing. Some drills will be included with specific units. In other cases you are to choose your own drills or those drills that will help you the most. You may select drills from your type book or from the various typing drill books on the shelves.

The drills should be typed in the following manner:

1. Type the following in the upper left corner:
   Name
   Type and Transcription
   Semester 1
   Drill Sheet
2. Type the date at the beginning of each day's drill.
3. Set margins for each specific drill.
4. In the case of single line drills, type the line at least twice or until you can type it without error. Single space these lines and double space before starting a new one.

16096

5. In drill paragraphs, type the paragraph single space and double space between paragraphs.
6. Do not use a new sheet each day for drill work. Fill both sides of the paper.
7. Hand in drill paper when both sides are filled.

Note: A page showing how to type special signs and symbols is attached. Please read it carefully.

16097

Type and Transcription
(First Semester)

CORRECTION OF ERRORS

The student will be able to locate, erase, and correct all typing errors made. This will be accomplished through the study of rules and typing examples. No test will be given to cover this unit; however, it will be expected that the student will take care in reading and proofing all of his work so that he will be able to detect the errors made and make suitable corrections. This is a continuous unit--in all typing work corrections should be made carefully when errors are made.

- - - - - - -

Even an efficient typist makes mistakes occasionally. The paper should not be wasted by "yanking" it out of the machine and starting over. Time is also wasted by doing this and time is expensive. If the error can be corrected and the copy be made usable, it should be done.

In order to be able to erase and make corrections efficiently, be sure to study the instructions and follow directions carefully.

Remember: No work is complete until it has been proofread carefully and all corrections made. It is just as important to be able to detect your errors and correct them neatly as any other typing skill.

The following are various ways in which you can make corrections in your work. Study them carefully and do the examples when you are directed to do so.

GUIDES FOR ERASING[2]

1. Use a plastic shield and a typewriter (hard) eraser.

2. Lift the paper bail.

3. Turn the paper forward if the error is on the upper two-thirds or backward if the error is on the lower third of the page.

4. Move the carriage to the left or right as far as you can (by using the margin release key) so the eraser crumbs will not fall into the typewriter mechanism.

5. Erase lightly. Blow eraser particles away as you erase.

6. Turn the paper back to writing position and type.

---

[2] Lessenberry, Crawford, and Erickson, 20th Century Typewriting, Eighth Edition, Complete Course (Cincinnati: South-Western Publishing Company, 1962), p. 101.

16098

SQUEEZING AND SPREADING LETTERS[3]

It is often advisable to "squeeze" omitted letters into half spaces or to "spread" letters to fill out spaces to avoid erasing an entire word or retyping a page.

Squeezing Letters

A. If a letter is omitted within a word:
   1. Erase the misspelled word.
   2. The carriage of the typewriter moves forward half a space when you depress the space bar. The carriage moves forward another half space when you release the space bar. With the writing point placed in the space following the previous word, hold the space bar down and type the first letter of the word to be inserted. Release the space bar.
   3. Hold the space bar down and type the second letter. Release the space bar.
   4. Follow this same procedure until the entire word is typed correctly. (This procedure will reduce the spacing between the word being squeezed and the word immediately before and after it).

B. If a letter is omitted at the end of a word:
   1. Move the writing point to the last letter before the omitted letter.
   2. Hold the space bar down and type the omitted letter.

C. For electric typewriters:
   When using an electric typewriter, the typist must hold the carriage in the correct position with the hand as each key in a squeezed word is struck.

Turn to page 105 in your type book and practice "squeezing" letters (66-D). Follow directions given. Type the sentences as many times as you need to to make the corrections look neat. (This drill should be checked with your teacher so that you are sure you are doing it correctly). If you have any problem in making these corrections, be sure to ask your teacher for help.

Spreading Letters

A. If an extra letter is added to a word:
   1. Erase the misspelled word.
   2. Type the first letter of the word to be inserted a half space to the right of its original position.

---

[3]Freeman, op. cit., pp. 2-3.

16099

3. Follow the same procedure for each letter until the entire word is typed correctly. The result of this procedure is to increase the spacing between the word being spread and the words immediately before and after it.

Type the following sentence as it is typed here:

Spelling correcttly is very important in writing.

Note: The word "correctly" has two "t's" instead of one.

Erase the word and type it in again spelled correctly. Repeat this process until you feel that you can do it well. Check with your teacher to see if you are doing it right.

Aligning and typing over a word:

At times it is necessary to retype a word after your paper has been removed from the machine. It is necessary to align the word so that the retyping will not be detected.

Turn to Page 70 in your type book and study 41-D carefully.

Follow the directions given until you can do the work accurately. Check with your teacher. If you have difficulty doing this, be sure to ask your teacher for help.

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: X. SERVICING

MILESTONE: I. LUBRICATION

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Changing Oil and Grease

CONDITIONS:

BEHAVIOR:

12. Grease automobile following steps as outlined in manual
13. Remove all tools, materials, etc. from under automobile
14. Lower automobile to floor
15. Fill crank case with lubricant following all steps as outlined in the manual
16. Start engine and check for leaks
17. Check automatic transmission fluid level following steps as outlined in the manual
18. If all checks are satisfactory, return tools and materials to proper place
19. Remove fender covers and store in proper place
20. Return automobile to proper parking area
21. Remove front seat covers and store in proper place
22. Clean work station for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily change oil and grease automobile in 1 hour

Learning time: 3 hours

1605

Type and Transcription
(First Semester)

CENTERING

The student will be able to center material horizontally (using the backspace from center method) and vertically (both the exact center placement and the off-center or reading position).

The test will consist of centering a poem horizontally and vertically, centering between two vertical lines, and centering several lines horizontally within a prescribed time limit.

- - - - - - -

Centering refers to the process of arranging material on paper so that the top and bottom margins are equal visually (vertical centering) and the left and right margins are approximately equal (horizontal centering).

POINTS TO REMEMBER

Horizontal Centering.

Number of spaces in a horizontal inch, pica type: 10
Number of spaces in a horizontal inch, elite type: 12
(The typewriters in the school are all elite type)
Dimensions of standard-size typewriting paper: 8 1/2 x 11"
Centering point for standard-size paper, pica type: 42
Centering point for standard-size paper, elite type: 51
(This is when your paper guide is set at 0 -- you can adjust your paper so that the center is 50 for easy centering)

Vertical Centering.

Number of line spaces to a vertical inch: 6
Number of available line spaces on a full sheet of paper: 66
Number of available line spaces on a half sheet of paper: 33
Number of available line spaces on a card 5 inches long: 30

"Spread Heading"

When a title is "spread," put one space between the letters and three spaces between the words. To center a spread heading, backspace from the center of the paper once for each letter except the last one in the line and once for each space between words.

Example: Spread each title listed below. Be sure to center horizontally. (Text, page 85).

(Use the same sheet of paper for all the examples of centering).

A THEME
OUTLINE FOR A THEME

SUMMER WORK
IN THE COOL OF THE DAY

161131

Steps in Centering Lines, Titles, and Headings[4]

1. Set the paper guide so that the paper will be centered when it is inserted into the typewriter.
2. Move the carriage to the center of the paper (centering point). Set a tab stop.
3. From the center of the paper, backspace once for every two strokes (letters, spaces, marks of punctuation, etc.) as you spell the copy to be centered. If there is one letter left, do not backspace for it.
4. Begin to type at the point where the backspacing is completed.
5. If there are more lines to be centered, tabulate to the centering point, and repeat step 3 and 4. Continue in this manner until all lines have been typed.

Steps in Vertical Spacing[5]

Typewritten material is most frequently single spaced so there are no blank lines between the typewritten lines. To make it easier to read (as in the case of manuscripts) such material is quite often double spaced (one blank line between typewritten lines). For special effects, such as headings, triple spacing (two blank lines between typewritten lines) is sometimes used.

This is	This is	This is
single	-	-
spacing	double	-
	-	triple
	spacing	-
		-
		spacing

1. Count all of the lines required to type the problem; include headings, lines in the body of the material, and all blank lines. Remember, every double space counts as one blank line; every triple space counts as two blank lines.

2. Subtract the total lines required to type the problem from the available lines on the page--66 on a standard page 11 inches long (6 lines to a vertical inch).

---

[4]House, Clifford R. and Samuel Skurow, Typewriting Style Manual (Cincinnati: South-Western Publishing Company, 1958), p. 8.

[5]Ibid., p. 9.

16102

3. Divide the remaining number of lines by two to get the top and bottom margins. Drop the fraction if there is one.

These steps will place the copy in what is called exact vertical center, with equal space in top and bottom margins.

Off-Center or Reading Position

To type in off-center or reading position, figure for exact vertical centering and then roll the cylinder back three more times.

Drawing lines on work that is in the typewriter

Horizontal lines: Usually the underscore is used. However, if you use pen or pencil, lock the shift key and shift the ribbon to the stencil position. Insert your pencil, or pen, in the fork of the ribbon guide. Move the carriage across the page for the ruled line by pressing down on the pencil or pen and using the carriage-release lever.

Vertical lines: Release the platen for variable spacing. Roll the platen up while holding a pencil, or pen, point firmly at the desired spot. Do not put your pen or pencil on the ribbon.

Example: Draw several horizontal and vertical lines with your pencil while your paper is in the machine. Make a box by connecting horizontal lines. (If you have difficulty doing this, be sure to check with your teacher for help).

Centering Items Between Vertical Lines

1. Move the carriage to the first space to the right of the left line and note the figure on the scale.

2. Move the carriage to the last space before the right line and note the figure on the scale.

3. Add the figure indicating the point at which the space between the lines begins and the figure indicating the point at which the space ends, and divide by 2 to determine the exact center of the space.

4. Then move the carriage to the center point, backspace once for each two letters or letter and space in the heading to be centered, and start to type at the point at which the backspacing ends.

   Example:

   Set your left margin at 15 and, using the underscore, type five 50-space lines with triple spacing. (See illustration on the next page). Make the vertical lines with your pencil. Make three of these.

Solution to Drill 1[6]

Howard Chase Manufacturing Company
Room 602, Steward Building
465ß West 43rd Street
New York, New York 10032

Drill 1. Center each of the following lines, starting on line 2 of the first lined box.

Howard Chase Manufacturing Company
Room 602, Steward Building
4658 West 43rd Street
New York, New York 10032

Drill 2. Center the following items, one on each line, beginning on line 2 of the second lined box.

Dr. T. James Crawford
Graduate School of Business
Indiana University
Bloomington, Indiana 47401

Drill 3. Center the following items, one on each line, beginning on line 2 of the third lined box.

Your name
Your address
Your city, state, and ZIP code
Your telephone number

Centering Drills

Note: Each line to be centered is separated by a diagonal (/). (Material is listed at the end of instructions for Drill 3).

[6] Liguori, Frank E, Basic Typewriting Operations--Principles and Problems (Cincinnati: South-Western Publishing Company, 1965), p. 17.

Drill 1. Use a half sheet of paper and double spacing. Center each line horizontally and the entire exercise vertically.

Drill 2. Use a half sheet of paper inserted with the long edge at the left and double spacing. Center each line horizontally and the entire exercise vertically.

Drill 3. Use paper cut to 6 x 4 inches and inserted with the short edge at the left. Use double spacing. Center each line horizontally and the entire exercise vertically.[7]

THE JUNIOR ADVISERS/
Will meet on Thursday,
January 6,/ to hear Mr. William
Brown speak on/ "How to Advise
Effectively."/ Room 236 at 3:45 p.m./

Centering a Poem

Type the following poem on a half sheet of paper. Center it vertically and horizontally. Use a spread heading. (In figuring the horizontal centering in a poem, count the longest line to set your left margin).

His Handiwork[8]

The night held its breath,
Like a frightened child
Unexpectedly alone in an unlighted room.

Quick flashes of lightning
Cut through the jet blackness of the night,
As big raindrops splashed against the dry ground.

The drooping tulips lifted their petals joyously
As they drank in the cool freshness of the rain.
"And the firmament showeth His handiwork."

---

16105

Centering an exact copy

Center an exact copy of the following enumeration on a full sheet of paper. Check your work carefully and make the corrections necessary.

CARE OF THE MACHINE[9]

1. Daily, clean the type faces by brushing them with a stiff brush or by using a commercial product made for the purpose.

2. Daily, dust the machine--use a long-handled brush for whisking out the inside and a soft cloth for wiping off the outside.

3. Daily, wipe off the desk--be sure that you wipe under the machine as well as around it.

4. Daily, cover the machine when not in use.

5. Weekly, wipe the carriage rails--use a soft cloth that has been dampened slightly in oil. Never put oil directly on any of the parts.

6. Monthly, wipe the cylinder with a soft cloth that has been dampened in alcohol.

After completing all the examples and production work, plus your daily drills in this unit, check your work carefully and hand your papers to your teacher. If this work has been done satisfactorily, you will be given the test for the unit.

After completing the tests for this unit hand your papers to your teacher for checking. If the work is satisfactory, your teacher will give you your next assignment, if not, supplementary work will be given to you.

---

16106

TEST NO. 1

Type the following poem on a full sheet of paper. Use single spacing with double spacing between stanzas. Spread the heading and center the poem vertically and horizontally. You will have a time limit of 10 minutes.

ENGLISH PLURALS

English plurals,
You will agree,
Are a puzzling problem
For you and me!

One fowl is a goose,
But two are called geese:
Yet the plural of mouse
Is never called meese.

If the plural of man
Is always men,
Why shouldn't the plural
Of pan be called pen?

The cow in the plural
Is cows or kine,
But the plural of vow
Is vows--not vine.

If I speak of foot
You show me two feet,
If I give you a boot,
Would a pair be called beet?

One is a tooth
And a whole set is teeth,
Why shouldn't the plural
Of booth be called beeth?

If the singular's this
And the plural these,
Should the plural of kiss
Be known as kese?

We speak of a brother
And also brethren,
But though we say mother,
We never say Methren.

Then the masculin pronouns
Are he, his, and him.
But imagine the feminine--
She, shis, or shim!

16107801

TEST NO. 2

1. On your typewriter draw two vertical lines 4 inches apart and 2 inches long. (10-minute time limit)

   a. Center your name between the lines.

   b. Type the word THINKING (centered and "spread" a double space below your name.

2. On your typewriter draw a box. (5 inches horizontally and 3 inches vertically.) Within the box center the following:

   a. Your name

   b. Your school

   c. City and state of your school

TEST NO. 3

Center each of the following lines horizontally. Arrange all lines so that they are centered vertically. Use double spacing. This should be typed within a time limit of 15 minutes.

We worked and worked.
They looked in the pantry.
He asked for more time.
I learned how to throw and how to kick.
He told us to go.
The trip to the ship took two hours.
We should use a high quality of paper.
A party will take a lot of work if we are to write the folks.
He said it was as easy as a b c.
Dick said.
Dave plans to take a trip this summer.
Put your typewriter on a desk.
Have a comfortable chair.
Live so that you do your best every day.
Typewriting is a sport as well as a useful tool.
Organize your supplies.
Six ways to get a job.
Harper & Brothers
Clerical Office Practice

16108

ROUGH DRAFTS

Performance Criteria

The student will be able to type a corrected final copy from a rough draft copy using proofreader's marks. The test will consist of a one-page rough draft to be typed in final form in a time limit of 20 minutes.

- - - - - - -

A rough draft is an original copy corrected with pencil or ink. To type a final copy from a rough draft it is necessary to be able to read proofreader's marks. In typing a final copy, be sure that the information is complete and that it makes sense--all corrections must be made accurately.

Often when changes are made in the original copy, the following proofreader's marks are used to correct the rough draft. Listed below are a few of these proofreader's marks for you to use as reference.

Proofreader's Marks[10]

# Space	lc Lower Case	≡ Capitalize
^ Insert	⊐ Move to right	Spelling or Spell out
⁀ Close up	⊏ Move to left	¶ Paragraph
Delete (take out)	tr Transpose	⊙ Colon
sted Let stand	⊙ Period	

- - - - - - -

During this unit use the rough-draft paragraphs as drill material. You will find these in various sections of your type book. Spend from five to ten minutes a day on this drill. If there is any part that you do not understand, do not hesitate to ask the teacher for help.

Follow the steps in this unit carefully so that you will become familiar with the proofreader's marks and be able to type corrected copy from rough draft material.

1. Turn to Page 10 in Basic Typewriting Operations: Principles and Problems (on the reference shelf) and type each sentence twice. Be sure to make the corrections indicated according to the proofreader's marks.

---

[10]Liguori, op. cit., p. 10.

Use Rough-Draft Sentences as the heading (type all in "caps"); 70-space line; double space after the second typing of each sentence. Center the material vertically. Be sure to check your work and make the necessary corrections.

2. Type the following rough-draft material. Use a two-inch top margin, 70-space line, double space, 5-space paragraph indention. Remember to space three times after the main heading. Check your work carefully and make the necessary corrections:

Business Education at Hamilton[11]

The business education department will again be offering a very complete program in the areas of Secretarial Studies. Bookkeeping, Clerical, and Distributive Education. For first time, a work experience program will be in operation in conjunction with the Distributive Education courses. In order to get practical experience, students will be placed in various businesses in the community. The Department is expected to expand this program of work-experience at the conclusion of this first experimental year. Business Education has something to offer to every student in the school, including those who intend to continue on to college. Among subjects especially geared to these students are personal notetaking, which teaches the students how to take notes in an abbreviated system and goes into other aspects of notetaking and studying, and personal typewriting. Shorthand and Typewriting are of tremendous value to students who wish to earn money while attending college. Business Law, bookkeeping, and office machines are also of value.

As always, the staff of the Business Education Department stands ready to be of help to all the students at Hamilton.

---

RELATED INSTRUCTION

SCHOOL: PETERSBURG, VIRGINIA FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: X, SERVICING

MILESTONE: II, LUBRICATION

PERFORMANCE OBJECTIVE NO: 2 TITLE: Repacking Front Wheel Bearings

CONDITIONS:

Student will learn the related information listed below

LEARN	REFERENCE	SOURCE
1. "Repacking Front Wheel Bearings"	1. Continuous film loop # 8351	1. Resource Materials Center
2. "Repacking a Universal"	2. Continuous film loop # 8369	2. Resource Materials Center

1609

3. Type the following memorandum in final copy form. Make all corrections indicated. Go down two inches from the top of your paper. Use a 60-space line. Double space the material. Proofread your paper for errors and make the necessary corrections.

TO ALL EMPLOYEES OF MODERN EQUIPMENT COMPANY:[12]

On September 5, we shall be opening our new store in the branchwood shopping center. Of necessity, there will be some confusion in changing from our present location. Your cooperation will take this transition easier and will be sincerely appreciated by your manager.

Part time help will be employed during the move to assist with much of the manual work. These people will also assist in arranging and displaying the merchandise.

During the week of the Grand Opening, the store will remain open until 9 p.m. each night, and you will have an opportukity for overtime work. All employees will return to their regular schedule of work assignments and hours of employment the following week.

The new store at Branchwood offers the advantages of the best possible location and ample facilities for customer parking. In addition, it provides our employees pleasant environment in which to work. All of these factors should result in a larger volume of business with increased earnings for all.

Philip Deatsman
President

4. Hand your production work in after checking it with the key. If your work is satisfactory, your teacher will give you your test material. If not, you will be given supplementary material to improve your skill in typing from rough-draft copy.

---

[12] Ibid., p. 67.

TESTS

Test Nos. 1, 2, and 3 should be typed in a 30-minute time limit. After you have typed these tests, proofread them carefully and make the necessary corrections. Neat erasure will be allowed.

When you complete the tests, hand them to your teacher who will check them and give you your next assignment.

TEST NO. 1

Directions: Type the final copy of the following material. Use a full-size sheet of paper; 60-space line; 5-space paragraph indention; double spacing (except for numbered paragraphs); two and one-half inch top margin. Center the main heading horizontally and type it in capital letters.

HOW TO ERASE

The efficient ~~worker~~ typist strives for a usable first ~~writing,~~ copy ~~but~~ when errors are made, however, they must be cor ected ~~and~~ skill in making the a corrections ~~must be learned~~ will help to offset loss of time.

Study carefully the steps in erasing:

1. Move the ~~machine~~ carriage to the right or to the left before erasing. This will prevent ~~all the~~ erasure waste from falling in to the typewriter mechanism.

2. ~~The~~ use ~~of~~ an eraser shield to protect the writing that is not be erased.

3. If the erasure is made on the upper 2 two-thirds of the paper, turn the cylinder forward; ~~turn it backward~~ if the correction is to be made on the lower third of the paper, turn the cylinder backward so the proper alignment of the type will not be disturbed.

16112

TEST NO. 2

Directions: Type the final copy of the following theme. Use a full sheet of paper; 60-space line, double spacing; 3-inch top margin; type the heading centered horizontally and in all capital letters. Triple space after typing the heading.

MIRRORS

I have seen mirrors of rare beauty. In the cool, clear water of baxter's Creek that ran at the foot of the hill just below our house, I have seen mirrored, in inverted fashion the trees swaying lazily overhead. In the ballroom of the William Penn Hotel, walls of mirrors catch gleams of pure diamondlike beauty from the prisms of the chandeliers. A few books that mirror life and reflect something of great understanding and great love are now mine, too.

I know, too, an old man whose quiet eyes mirror the richness of a life well lived and the eager interest of a soul who views his numbered days without fear. Yes, I have seen mirrors of rare beauty.

16113

TEST NO. 3

Directions: Type the final copy of the following composition. Use a full sheet of paper; double spacing; top margin of 2 1/2 inches; 70-space line. Make all corrections indicated. Proofread your paper carefully.

all capital letters, center

Composition at the Typewriter

#

In your english classes you have learned to compose short theems and articles in Longhand. ~~You will be able to save considerable time~~ Considerable time can be saved if you learn to compose directly at the typewriter. When you compose first at the typewriter you may make more error than usual. These should be ignored or you may "x" them out and ~~then~~ type the correct word or words.

double space

When you compose letters or themes, it is well to think through and plan what you want to say. In the beginning, you that ~~the making of~~ a brief outline or a listing of the points to be covered will be an aid to you. Think and type and you will find that it is easy to gain composing skill ~~at the typewriter~~. You can gain skill by using the typewriter for any composing work that you do.

underline

Alternate the "x" and the "m" to speed up the process of "x'ing" out words.

TABULATION (Statistical Typing)

Performance Criteria

At the conclusion of this unit you will be able to set up material in tabulated form in an accurate and attractive manner. You will be given a test consisting of a simple two-column tabulation, a tabulation with column headings, a tabulation with money columns, and a tabulation within a letter. These tests will be typed from unarranged material so that you will have to figure the correct spacing. The tabulations must be accurate. Neat erasures will be allowed.

- - - - - -

In business today, more importance is being placed on the typing of numbers and tabulations.

To be able to type statistical matter such as tabulations, you should develop a skill in typing numbers. For your warm-up drills during this unit use the following drills: These drills are taken from the book, "Statistical Typing with Tabulation Problems."[13] These books are on the reference shelf. Use this material to build up your ability to type numbers more accurately. Try to do these drills without looking at your fingers. Keep your machine moving smoothly.

Pages 1, 2, and 3 -- Figure and Symbol Key Drills
Pages 4, 5, and 6 -- Building Skill in Typing Figures and Symbols

There are various number drills in your text book. Use these from time to time, especially when you are trying to learn the location of the numbers better. You should be careful in typing these drills so that you do not acquire bad habits such as looking at your fingers while you type and typing with poor rhythm.

You will be given simple tabulation problems at first and then more involved ones. You will also be given instructions as you go along for each new step. Follow these instructions carefully and you will find that it is not only challenging, but interesting to type tabulated material.

You will be instructed as to how to proofread statistical material. (See attached sheet). This is extremely important inasmuch as a tabulation is useless unless the material listed is correct.

- - - - - -

Follow the listed instructions step by step to develop your skill in tabulation typing: Be sure to read and study the supplementary sheets of instructions.

---

[13] Wanous, S. J., Statistical Typing with Tabulation Problems, Second Edition (Cincinnati: South-Western Publishing Company, 1956)

116115

1. Turn to Page 59 in the type book. Type 33-B on a half sheet of paper, using a 60-space line, single spacing, block style. Center the material vertically. Remember to double space between paragraphs.

2. Type 33-C, Page 59 in the type book according to the directions given in the book. (This may be done on one sheet of paper.)

3. Drill 10-E, Page 24, in the type book. This drill will review the setting of tab stops. Follow the directions given in the book.

After completing this drill, turn to Page 26, 11-D and follow directions given.

Type 18-D, Page 37 following book instructions.

4. Turn to 35-C, Page 62, in the type book. Follow the directions given in the book.

5. Turn to Page 97 and read "Guides for Horizontal Placement of Columns."

6. Type 61-C, Problem 1, Page 97. Follow the book directions.

7. Type 62-C, Problems 1 and 2, Page 99 in your textbook. Follow book directions.

Note: Read and study "Guides for Spacing the Tabulation," Page 99 before typing 62-C.

8. To center columnar headings. From the point where the column is to begin, space forward once for each two spaces in the longest line in the column, which will bring the machine to the center of the column. From this point backspace once for each two spaces in the columnar heading. Begin to type where the backspacing ends.

Type 63-C, Problem 2, Page 100, in the type book.

9. Type 66-C, Problem 3, Page 104, in the type book. Follow book directions.

10. Type 67-B, Problem 1, Page 105, in the type book. Follow book directions.

11. Type 68-C, Problem 1, Page 107, in the type book. Follow the book directions with the exception of the carbon copy.

12. Type Problem 2, Page 115, follow the book directions.

13. Type 109-B, Page 169, in the type book. Follow the book directions.

14. Hand in all your production after you have checked it with the key. Your teacher will then give you the test material.

CFE 16116

15. Test Nos. 1 and 2 should be typed in 30 minutes. After typing these tests hand them to your teacher for checking. (Be sure to proofread carefully).

16. Type Nos. 3 and 4 in a 30-minute time limit. Check your papers carefully and hand them to your teacher for checking.

17. If you type these tests satisfactorily, your teacher will give you your next assignment. If not, she will give you some supplementary material to type.

16117

TYPING MONEY COLUMNS IN A TABLE[14]

1. Keep money columns even at the right. If a column becomes narrower it is wise to shift the tab. (As in the Dues column below).

2. Use the $ sign only at the top and, if a totals line is used, at the bottom of a column. If both signs are used, they must line up. (In the School column below, a space follows the first $ sign so it will line up with the one in the totals line at the bottom of the column).

3. If there is a bottom totals line, the word Totals may be (a) blocked with, or centered under, the first column; or (b) indented one space for each column in the table (as shown below).

4. When centering a money column under its heading, (a) note that the bottom totals entry, if there is one, may be the longest item in the column; and (b) ignore or count the $ sign, whichever makes centering easier. (Below: The $ sign is not counted for the Total column but is counted for the Dues and School columns).

BUDGETS FOR SCHOOL CLUBS

(1967 - 1968)

Organization	Dues	School	Total
Girls Athletic Club	$150	$ 50	$200
Boys Hi-Y	125	35	160
Business Club	75	25	100
Science Club	75	25	100
French Club	75	25	100
Forensics Club	50	25	75
Hobby Club	50	15	65
TOTALS	$625	$625	$825

[14] Freeman, op. cit., p. 118.

16118

SPACING TABLES[15]

Study the illustration below. It shows you how many spaces to allow between the various headings and parts of a table.

Note that top and bottom margins of the table are equal. The table is said to be centered vertically. To center a table vertically, proceed as follows:

1. Count the lines in the entire table, including the lines between the headings.
2. Subtract the number of lines from 66 if a full sheet is used or from 33 if a half sheet is used. Divide by two for equal top and bottom margins. This will place the copy in exact center position.
3. To place the copy in reading position, subtract three spaces from the top margin.

WEEKLY REPORT OF SALES ← Main heading

Double space →

Week Ending July 5 ← Secondary heading

Triple space →

Name	Amount ← Column heading
Double space →	
John Charles Barrons	$2,030.19 ← Column entry
Beverly Joyce Armstrong	1,975.50
Glenn Noble Bassett	1,875.80
Laurence Brent Carver	1,511.00
Roger Lee De Forest	1,500.56
Camillo Wilde	1,314.75
John Harlow, Jr.	925.89
Alice Kathleen Swan	910.50

[15] Wanous, op. cit., p. 9.

16119

HOW TO TYPE STATISTICAL COPY[16]

Copy containing figures must be typed and proofread with the greatest care. Errors are easy to make but hard to find. Yet the copy you prepare must be absolutely accurate, as errors in figures can be very costly. Use the guides below. They will help you to become an expert typist.

1. Type columns of figures horizontally with the aid of the tabulator mechanism.

2. Use a ruler as an aid in reading the correct figures in each column; otherwise, your eyes may skip some of the figures. Read across; then, move the ruler down for the next line.

3. In reading the numbers for typing, group figures and use comma divisions whenever possible. For instance, read 1235 as twelve thirty-five, not one, two, three, five; 1,235 as one, two thirty-five; 10.25 as ten point twenty-five, not ten and twenty-five hundredths.

---

[16] Ibid., p. 131.

16120

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: X. SERVICING

MILESTONE: II. LUBRICATION

PERFORMANCE OBJECTIVE NO.: 2 TITLE: Repacking Front Wheel Bearings

CONDITIONS:

This assignment will be performed on a complete automobile

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Position hoist arms and raise automobile to comfortable working height
6. Remove front wheels and hubs following steps as outlined in the manual
7. Remove old grease from hubs and bearings following all steps as outlined in the manual
8. Make all tests and checks as outlined in the manual
9. Repack bearings following all steps as outlined in the manual
10. Install front wheels and hubs following all steps as outlined in the manual

PERFORMANCE CRITERIA:

1607

STEPS IN TABULATING[17]

1.

Center the paper in the machine.

2.

Clear the tab stops.

3.

Decide on the number of spaces that are to be used between the columns (4, 6, 8, 10, or 12)

4.

Move the carriage to the center of the machine.

5.

Backspace once for each two spaces in the longest word in each column.

6.

Backspace once for each two spaces between the columns.

7.

Set the left margin stop. This is the point at which the first column will start.

8.

From the left margin, space forward once for each letter, digit, and space in the longest item in the first column and once for each space between columns 1 and 2. Set the tab stop for the second column. Continue in this way until all stops have been set.

9.

Return the carriage. Operate the tab bar or key to determine whether all the tab stops have been set.

---

[17] Ibid., p. 10.

16121

HOW TO PROOFREAD STATISTICAL COPY[18]

The guides given below have been found to be helpful in proofreading tables and other statistical matter. Study these guides. Use them in checking your work.

1. Proofread statistical copy in pairs. Read aloud from the original while someone else checks the copy you prepared.

2. If you must proofread your own work, place the original and the typed copies as close together as possible, matching the numbers on a horizontal plane. Read a number from the original copy first; then, compare it with the corresponding number in the typed copy.

3. Proofread straight columns of numbers vertically; that is, read and check the numbers in the first column, then the second and so on until you finish the job.

4. Proofread straight copy containing figures and table copy in which items are lined out and corrected horizontally; that is, line by line.

5. In proofreading numbers, use the procedures described and illustrated on Page 8.

EXPLANATION	NUMBER	PROCEDURE
Double figures and use comma divisions whenever possible. Note the illustration in the opposite column.	12	Twelve
	123	One twenty-three
	1234	Twelve thirty-four
	1,234	One two thirty-four
	12,345	Twelve three forty-five
	123,456	One twenty-three four fifty-six
For numbers that are repeated, use the word "twice." For numbers appearing three or more times, use "three times," "four times," etc.	325	Three twenty-five--
	325	twice
	672	Six seventy-two--
	672	3 times
	672	

[18] Ibid., pp. 7,8.

16122

Refer to a cipher as a 0 (pronounced oh) or zero.	2-05 2-05 2-05 2-05	Two dash zero five--4 times
For consecutive numbers, read all the digits in the first number, but only the last two digits of the remaining numbers.	1950 1951 1952 1953	Nineteen fifty, fifty-one, fifty-two, fifty-three

10123

TEST NO. 1

Directions. Set up the following data in two columns. Use 12 spaces between columns and double space the material in the columns. Center the tabulation vertically and horizontally. 15-minute time limit.

NUMBER OF TAXICABS OPERATED IN
15 LARGEST CITIES[19]

New York, New York, 11,796; Chicago, Illinois, 3,749; Philadelphia, Pennsylvania, 2,150; Los Angeles, California, 967; Detroit, Michigan, 1,310; Baltimore, Maryland, 1,1514; Cleveland, Ohio, 586; St. Louis, Missouri, 1,034; Washington, D. C., 9,534; Boston, Massachusetts, 1,525; San Francisco, California, 739; Pittsburgh, Pennsylvania, 617; Milwaukee, Wisconsin, 500; Houston, Texas, 551; Buffalo, New York, 375.

(First Semester)
Tabulation

TEST NO. 3[21]

Directions: Type the following letter in Modified Block Form with Indented Paragraphs. 15-minute time limit.

Current Date.

Mr. Paul Cleary, Supreme Manufacturing Co., 2480 Washington Street, Mentor, Ohio 44060 Dear Mr. Cleary: It is with pleasure that we answer your inquiry about supply storage cabinets. All the cabinets we handle are steel, full height, double-door units. They have four adjustable shelves and are made to withstand heavy loading. Here are four of the most popular models:

Model No.	Depth	Height	Price
802	18"	72"	$42.50
803	18"	78"	54.00
840	24"	72"	52.00
841	24"	78"	64.50

(P) All cabinets are 36" wide, so they will fit into the space you have available. (P) Enclosed is literature on the four units described above. All are on display in our showroom and may be viewed at any time. (P) If we can be of any further assistance, please advise. Sincerely yours, Henry Dillon, Sales Manager, (initials), Enclosure.

16127

Type and Transcription
(First Semester)

MANUSCRIPTS

Performance Criteria:

At the conclusion of this unit you will be able to type an outline and a manuscript without footnotes in correct form in 30 minutes. You will also be able to type a title page and a short manuscript with footnotes according to correct manuscript form. This will be done in a time limit of 30 minutes.

- - - - - - -

Typists are often called upon to type in final form material which is not correspondence but which must be arranged neatly on a full sheet of good quality paper. Typing this material is usually referred to as manuscript or report typing.

Manuscript typing includes such items as school themes, research papers, master's theses, various kinds of business or technical reports, etc. Certain details are followed for the arrangement of material in manuscript form. Often school policy may determine the manuscript form and arrangement, but the details of form and arrangement that are used in this unit are acceptable for general use.

During this unit you should drill at least five minutes each day to increase your speed and accuracy in typing. You are to hand your drill papers in with the production lessons of this unit. Use the drills in your type book and select those that will help you the most.

Always proofread carefully and make the corrections as needed.

Note: A guide line sheet has been placed in this unit for your use. Place it behind your paper before you insert it in the typewriter. This will help you keep the proper margins for manuscript typing.

If any questions arise, please ask your teacher.

- - - - - - -

Follow the listed instructions step by step to develop your skill in manuscript typing:

1. Turn to page 82 in the type book. Type Problem 51-B. Follow the book directions carefully.

2. Type Problem 2, 52-C, page 85, in the type book. Use a full sheet of paper and center the problem both vertically and horizontally.

16128

3. Type the following outline in correct form. Center the problem both vertically and horizontally.

Title: Control Panel Wiring[23]
I. TABULATOR (ACCOUNTING MACHINE)

III. COLLATOR
A. Matching
B. Merging
C. Selecting
D. Sequence Checking

4. Type Problem 88-D, page 137-138, in your type book. Read and follow carefully the book instructions.

5. When typing manuscripts, it is often necessary as in letters, etc., to divide a word at the end of a line. It is very important that this is done correctly. If it is not, it is considered an error. This exercise and some that follow will be helpful in reviewing the rules for word division. However, if you are ever in doubt as to how to divide a word, always consult your dictionary. A Rules for Word Division paper is attached.

6. Type Problem 81-C, page 126, in the type book. Follow the book directions. This guide should be kept for reference throughout this course.

7. Type Problem 55-C, page 89. Follow the book directions.

8. Type 81-D, Problem 1, page 127. Follow the book directions, but type this assignment on the bottom half of the sheet of paper used for the preceding problem.

---

[23] Ibid., p. 60.

16129

9. Type 82-C, Problem 1, page 128, and Problem 1, 83-C, page 130. Use the top and bottom half of the same sheet of paper and follow the book instructions.

10. Type 88-C, page 137, 89-C, page 139, 90-C, and 91-C, page 145. Use a two-inch top margin for the first page and a one-inch top margin for all other pages. There should be approximately a one-inch bottom margin on all pages. Place the page number on all pages except the first page on the fourth line from the top of the page at the right margin. Then begin typing on line seven. Use a 70-space line. Type the number given for each guide outside the left margin. Do this by using the margin release, backspacing four spaces from the left margin stop. Do not underscore the letter underscored in red. This assignment should be kept for reference throughout this course.

11. Type 131-B, page 193, 132-B, page 195, 133-B, page 197, 134-B, page 199, and 135-B, page 200. Follow the instructions listed for assignment #10. This assignment should also be kept for reference throughout this course.

12. Type the following one-page manuscript in manuscript form. Refer to your outline of manuscript form for correct spacing and margins. Assume that this manuscript will be bound on the left.

Title: The Power of Speech

A great man once said that could he keep only one of his faculties, he would choose the power of speech. With this, he said, he could overcome the loss of his other faculties. This gives much emphasis to the power of speech, but speech is as vital to each of us as it was to that great man. (P) Think of the times and places in the last few days that people have stopped to talk to someone. How often we try to put across an idea, tell a joke, ask a question, or agree with another person! There is the talk with one's best friend about plans for Saturday evening, the explanation of how to do certain homework, the attempt to get parents' permission for something, and the casual talk at the school lunch table. (P) Speech plays a great part in everything that one does--and it also plays a major role in making up one's personality. Among the many qualities of personality, one of the most important undoubtedly is speech. The way in which people talk and what they say genuinely affect their attitudes toward one another. (P) If this be true, then everyone should strive diligently to learn to speak well. Probably the best time to begin is while we are in school. (P) A person who has learned to express himself easily and clearly will find that this ability opens doors of opportunity in his business and social life that might otherwise remain closed.

13. Type 84-C, page 132. Be sure that you read all of the instructions carefully. There will be a title page and table of contents in this assignment also. Follow the directions on page 132

---

/ PERFORMANCE OBJECTIVE STATEMENT /

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: X. SERVICING

MILESTONE: II. LUBRICATION

PERFORMANCE OBJECTIVE NO.: 2 TITLE: Repacking Front Wheel Bearings

CONDITIONS:

BEHAVIOR:

11. Make finsl and adjustments
12. If all tests and adjustments are satisfactory, return tools and materials to proper place
13. Lower automobile to floor
14. Return automobile to proper parking area
15. Remove front seat covers and store in proper place
16. Clean work station for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily remove front wheels, pack bearings, and reassemble in 2 hours.

1608

Learning time: 2 hours

for these. The table of contents is to be typed after the manuscript is completed so that the page numbers will correspond with your paper. Use a left margin of 30 and a right margin of 76 for the table of contents. NOTE: Leaders connect the headings and their corresponding page numbers. Leaders are periods and spaces typed alternately, with a blank space before the first period and at least one blank space after the last period. Subsequent rows of leaders may be aligned by noting whether the first line is typed with the periods on odd or even numbers and maintaining the same placement line.

Before you start typing read the following final pointers for manuscript typing:

a. Keep all arrangements of material neat and simple.
b. Try to have at least two lines of paragraph at the bottom or at the top of a page.
c. Do not divide the last word of more than two lines in succession or the last word on the page.
d. When typing a sidebound manuscript, remember to center over the line of writing. The center will be 53 on your typewriter.

14. Refer to your capitalization guide sheet and re-read number six on footnotes. Also refer to your outline of manuscript form. Type 54-D, page 87. Follow the book directions. NOTE: Footnotes are separated from the last line of a manuscript by a single space, a 1 1/2 inch horizontal line from the left margin, and a double space. Remember the rule: single space before the line and double space after. Footnotes must appear on the same page as the notation to which they refer.

15. Type 55-B, page 88, Problems 1 and 2. Follow the book instructions except use a 70-space line.

16. Type 57-C, Problem 2, page 92. Do not follow the book instructions. Type this problem according to manuscript form. Refer to your guide to manuscript form if necessary. NOTE: If a manuscript does not take up a whole page or if it ends in the middle of a page, the line and footnote must be typed at the bottom of the page so that there is just an inch left at the bottom for a margin. If you have a question about this, ask your teacher.

17. Hand in all of your production work for this unit on manuscripts. Your teacher will give you the test material if you have completed the unit satisfactorily.

18. Test 1 and 2 should be typed in 30 minutes. After you have completed the tests, hand them to your teacher. Be sure to proofread carefully.

19. Test 3 should be typed in 30 minutes. Proofread your papers carefully and hand them to your teacher for checking.

20. If you type these tests according to the terms stated in the performance criteria, your teacher will give you the next assignment. If not, some supplementary material on this unit will be given to you.

WORD DIVISION RULES FOR TYPEWRITING[28]

DO NOT

1. Do not divide words unless absolutely necessary.

2. Do not divide words of one syllable.
   Right: type Wrong: ty-pe

3. Do not divide words of four or five letters.
   Right: avoid Wrong: a-void

4. Do not divide contractions.
   Right: wouldn't Wrong: would-n't

5. Do not divide abbreviations.
   Right: f.o.b. Wrong: f.o.-b.

6. Do not divide a word after a beginning syllable of one letter.
   Right: amount Wrong: a-mount

7. Do not divide a word before a final syllable of one or two letters.
   Right: heav-enly Wrong: heaven-ly

8. Do not divide a number unless it is a very long number, and then divide it at a comma.
   Right: 1,000 Wrong: 1,-000
   100,000,-000 100,000,0-00

9. Do not divide proper names.
   Right: Mr. John Armstrong Wrong: Mr. John Arm-strong

10. Do not divide the last word on the last line of a page.

DO

1. Divide words between whole syllables. If you are in doubt about the syllables of a word, consult a dictionary.
   Right: ques-tion Wrong: quest-ion

2. Divide words after a prefix of three or more letters.
   Right: pre-sentable Wrong: pres-entable

3. Divide words before a suffix of three or more letters.
   Right: present-able Wrong: presen-table

4. Divide words after a single-vowel syllable.
   Right: hori-zontal Wrong: hor-izontal

5. Divide words between two adjoining single-vowel syllables.
   Right: anxi-ety Wrong: anx-iety

6. Divide a compound or hyphenated word only between the parts of the word.
   Right: brother-in-law Wrong: broth-er-in-law

---

[28] Freeman, op. cit., p. 5.

16133 SCIA

7. Divide words between double consonants.

Right: buz-zard Wrong: buzz-ard

But:

Divide words after the double consonant when a suffix is added to a word that ends in a double consonant.

Right: bill-ing Wrong: bil-ling

Divide words between the double consonant when the last consonant is doubled with the addition of a suffix.

Right: stop-page Wrong: stopp-age

8. Divide dates (only if necessary) between the day and the year. Do not use a hyphen.

Right: May 12,
1966

Wrong: May 12,-
1966

TESTS

Test #1[25]

16135

Test #2 [26]

Directions: Type the following material in manuscript form. This particular manuscript will be unbound. The time limit on this problem is 15 minutes. You may use your guide sheet if you wish.

Title: The New Office Job

There are many problems facing the graduate who is ready to begin a new office job. In the first place, a transition must be made from a school class schedule to a quite different office schedule. In school, a great deal of work was routine and did not change much from day to day. In business, most of the work calls for decisions to be made by the worker and for the ability to meet new work situations. (P) In addition, a beginning office worker meets a social environment in the office which differs from that which he has known most of his school life. In school, the student worked mostly with people of about his own age and with those who had somewhat similar interests. The beginning office worker finds that fellow workers are probably older and that superiors often are middle-aged. He may need time to get used to the age factor. (P) Then, too, the beginning worker is subjected to a supervision far different from that which he knew in school. There, most of the supervision was provided by trained instructors who accepted mistakes and realized that mistakes are part of learning and growth. In the office, the worker is supervised by persons whose attitudes often may be that mistakes are expensive and have no place on the job. In class, when a given task was completed, the student was given something else to do under no pressure of time. On the job, he must learn how to keep busy. (P) In a study completed recently, a number of conclusions were made concerning graduates who had become office workers. Some of these conclusions relate to training that individuals can obtain in school. (P) It was found that a number of graduates did not have adequate training and information for locating a job. They were not well informed about office positions which might be available. They did not know the procedures to use to find job leads nor the methods they could use to make the initial job contact.

[26] Liguori, op. cit., p. 22.

Test #3[27]

Directions: Type the following material in correct manuscript form. This manuscript will be sidebound. You may use your guide sheet if you wish. Be sure to proofread carefully. Make a title page for this manuscript. Use your name and the school and today's date. The time limit for this problem is 30 minutes.

Title: Growth of Industry-Sponsored Economic Education

American business leaders have recently recognized economic education as a major responsibility of business. Both the public relations and the employee relations activities of many companies may now center on the same goal--economic education. "Economic education for employees is becoming accepted as a day-to-day operating problem a way of life for the well-managed business enterprise."[1] (P) Company efforts in economic education vary widely. Some programs consist merely of the sporadic distribution of posters or advertisements. Others are composed of formal courses in economic principles, in classes held for employees on company time at company expense and taught by trained economists. Within the last few years there has been a tremendous growth of formal course instruction. Information about free enterprise is perhaps the most widely used theme--and the one most commonly criticized. (P) In September, 1946, Mill and Factory, a handbook of production and maintenance know-how, reported a survey "made among all types and sizes of manufacturing companies about management's education on the many advantages of American free enterprise and how it functions."[2] About 500, or 48 percent, had programs called "employee education." The most frequently used media reported were employee publications, group meetings, and talks. Although companies frequently have encouraged employees by reimbursement of tuition to enroll for study in schools and colleges, the recent growth in course instruction has largely bypassed the use of academic institutions. (P) Few statistics on the actual extent of industry-sponsored economic education are available, due to the varied nature of the activities and the limited research on the subject. Some insight, however, can be obtained from the research which has been completed. (P) Although no one factor can be shown as the primary cause of industry's increased participation in economic education, four factors may be identified as basic causes: (1) the fear of socialism, (2) the growth of communism, (3) the desire to improve relations with employees, and (4) the desire to convey management's viewpoints and achievements to the general public.[3] Management of companies adopting programs of economic education was, by and large, motivated by one or a combination of these factors.

Type and Transcription
(First Semester)

BUSINESS LETTERS

Performance Criteria

At the conclusion of this unit you will be able to set up a business letter in an attractive and acceptable style. You should be able to type the letters in "mailable" form; that is, correct as to placement, typing, grammar, and punctuation. You should be able to proofread your work and make the proper corrections in a neat manner.

A test will be given at the end of the unit which will consist of typing letters in "mailable" form. The letters used in this test will be typed in the following styles: modified block with indented paragraphs, modified block with blocked paragraphs, and block. There will be examples of the long, average, and medium length letter and open and mixed punctuation. A time limit will be placed on the typing of these letters which will be approximately ten minutes for each short letter.

- - - - - - -

There are a number of acceptable styles to use in typing business letters. We will use only three styles in this unit. It must be remembered that a stenographer or typist should follow the style used in the office in which she is working regardless of whether the style was given in her "type" book.

Business letters have various parts in them that will be introduced as you go through the unit. You will find a Letter Placement Chart, examples of Principal Letter Styles, and a Parts of the Business Letter chart attached. You are expected to refer to these materials to help you in setting up the letters in your lessons.

During this unit you should drill at least five minutes each day to increase your speed and accuracy in typing. Use the drills in your type book and those in the supplementary drill books that you may obtain from your teacher. Select those that will help you most.

Follow the steps in this unit carefully so that you will become proficient in typing business letters. Remember that proofreading is as important as the typing itself. Proofread all material carefully and make corrections as needed.

16138

1. Turn to Page 102 in the type book and study the style letter. This is a Modified Block Style with Block paragraphs. (This means that there is no indention for paragraphs). Mixed Punctuation is used in this letter. (Read the "mixed punctuation" note on this page very carefully.

2. Type the style letter on Page 102. Proofread your work carefully and make any corrections necessary.

3. Type Problem 2, Page 103, in your type book. Follow the book directions carefully.

4. Type Problem 3, Page 103 in your type book. Follow book directions.

5. Type 66-C, Problem 1, Page 104, in the type book. Use Modified Block Style with Block Paragraphs and Mixed Punctuation. Use the current date. Use a 60-space line with eight spaces between the date and the inside address.

6. Enclosure designation. This is an indication that something is being sent with the letter. It always starts at the left margin, either one or two lines below the reference initials.

Enclosure Forms

One Enclosure	Two or more enclosures (Change number when necessary)
Enc.	Enclosures
Enclosure	Enclosures 2
	Enc. 2
	Enclosures (2)
	Enclosures: 2

7. Type the following letter using Modified Block Style with Block Paragraphs and Mixed Punctuation. Use the current date. This is an average length letter. Refer to your chart for placement:[29]

(Current date)/ Moore Advertising Company/ 201 Fifth Avenue/ New York, New York 60132/ Gentlemen/ Enclosed is a copy of a letter we have received from the Mansfield, Ohio, "Index" concerning your May 31 advertisement in that paper. As you will note, the letter indicates that we must pay the national rate in Mansfield. (P) Since our contract with you does not authorize the payment of a national rate for a paper of the "Index" type, we should have your confirmation before approving the invoice for payment. (P) A prompt letter from you will be appreciated. We are eager to settle the matter without delay so as not to jeopardize our arrangements for future space in this publication. Please address your letter to this company, not to the writer./ Yours very sincerely/ Robert R. Gault/ Contract Manager/ (initials)/ Enclosure

[29] Bowman, Wallace B., Business Letter Typing (Cincinnati: South-Western Publishing Company, 1957), p. 19.

16138
16139

8. Type the following letter. Use Modified Block Style with Block Paragraphs and Mixed Punctuation: (This is an average length letter).[30]

(Current Date)/ Yearbook Faculty Adviser/ Monticello High School/ Monticello, New York 12701/ Dear Adviser/ Herbert Yearbook can assure you of a number of advantages over your present yearbook producer. (P) These advantages are probably most dramatically apparent in the Company's highly individual approach to customer services, which include a number of historic firsts in the yearbook printing and photography field. (P) For example, the photography division now has outstanding available light photographers. These photographers use the finest equipment obtainable to provide dramatic and exciting available light pictures for the key areas of your book. (P) Our representative, Mr. John Lovell, would very much like to call upon you. He can tell you about our services in every area of yearbook photography and printing. He can show you why so many leading schools and colleges are using our services year after year. (P) Won't you please indicate on the enclosed card a convenient time that he may visit you./ Sincerely yours/ Harry Herbert, President/ (initials)/ Enclosure

9. Turn to Page 151 in your type book. This is a Modified Block Letter with Indented Paragraphs and Mixed Punctuation. Study this letter carefully.

10. Type the style letter on Page 151. Note that there are 198 actual words in the body of the letter. (Refer to your chart for placement). Be sure to proofread your work carefully and make all necessary corrections.

11. Type 95-C, Problem 1, Page 152, in your type book. Refer to your placement chart for margins and spacing. Type this letter in the Modified Block Style with Indented Paragraphs and Mixed Punctuation. NOTE: In this letter type the official title on the first line with the name in the inside address. Separate the name and the title with a comma. In the closing lines, type the title on the line below the name.

12. Type Problem 2, Page 152 in your type book in Modified Block Style with Indented Paragraphs and Mixed Punctuation. Refer to your chart for placement.

13. Type the following letter in Modified Block Style with Indented Paragraphs and Mixed Punctuation:[31]

(Current Date)/ Mr. Charles M. Munroe/ 333 Lincoln Street/ Lancaster, Pennsylvania 21034/ Dear Mr. Munroe/ Mr. C. H. Carlton has submitted to us an interesting book entitled ADVERTISING--ITS PRINCIPLES AND PURPOSES. He has asked us to purchase the publication rights from the Webb Publishing Company, which has had some financial difficulty and is now not in position to market it satisfactorily. (P) Would you be willing to read the book and let us know whether you believe it has any textbook possibilities? It may be that some revision of text material and some reorganization of chapters will be necessary. Please keep this in mind when making your recommendations (P) Of course, we expect to pay you the usual fee for your work./ Sincerely yours/ David E. Duncan/ (initials)

14. Type the following letter in Modified Block Style with Indented Paragraphs and Mixed Punctuation.

NOTE: In the closing of this letter the name of the company is used. This should be typed in two lines below the complimentary close and should be typed in all "caps." After you type the company's name, you should go down four lines (three blank spaces) to type the name or the title.[32]

(Current Date/ Mr. Charles M. Munroe/ 333 Lincoln Street/ Lancaster, Pennsylvania 21034/ Dear Mr. Munroe/ Mr. McGill and I have had time to give very careful attention to the competent and helpful report which you submitted to us concerning Carlton's ADVERTISING--ITS PRINCIPLES AND PURPOSES. We are particularly interested in your suggestion that Mr. Carlton revise his book in collaboration with some high school teacher of advertising. (P) If we were to persuade Mr. Carlton to consider such a revision, would you be in position to recommend a co-author? Or better still, would you be willing to undertake the revision yourself? In giving your answers, please keep in mind the importance of completing the revision in time to enable us to put the book on the market within the next eighteen months. (P) Our check is enclosed./ Sincerely yours/ MODERN PUBLISHING COMPANY/ David E. Duncan/ (initials)/ Enclosure

15. Turn to Page 71 in your text bock and study the style letter. This is a Block Style letter with Open Punctuation. (Read the notations on Open Punctuation carefully).

This is a personal letter and so the address of the person writing the letter appears on the letter. If this letter were a business letter, it would be written on letterhead paper and so the date is all that would be necessary to type.

16. Type the style letter on Page 71 of your type book. This is a Block Style letter with Open Punctuation. Proofread your work carefully.

17. Type the following letter in Block Style with Open Punctuation.[33] Refer to your chart for placement.

(Current Date)/ Mr. Sanford Barr, Manager/ Retailers, Inc./ 4444 Spring Street/ Opal Cliffs, California 95060/ Dear Mr. Barr/ We want to call your attention to the fact that, though you are an important executive in retailing, you are not getting the most practical business newspaper in your field, the highly specialized Retail News. (P) You are in a position where you have to know just about everything that is going on in the retail business. Retail News can show you by word and picture how other store managers are solving the very problems you might be having and how they are doing the very things you have to do. (P) Our editors canvass the whole country to get ideas--not spectacular things of great magnitude--but down-to-earth, everyday practical ideas which have proven successful for others and which you can adapt easily for your own store. (P) To keep a short note short, you can get your personal copy of Retail News by signing your name

16142

PLACEMENT CHART

Type the date 13-15 spaces down form the top of your paper if you are using plain paper.

If you are using a letterhead, always type the date a triple space after the last line of the letterhead. In such a case, you may have to add or subtract the number of lines between the date and inside address.

Length of Letter	Set Margins at: Pica	Elite	Number of Spaces between Date and inside Address Pica	Elite
300	10-70	15-90	2	4
275	10-70	15-90	3	4
250	10-70	15-90	4	5
225	10-70	15-90	5	6
200	10-70	15-90	6	7
175	15-65	20-85	7	8
150	15-65	20-85	8	9
125	15-65	20-85	9	10
100	20-60	25-80	10	11
75	20-60	25-80	11	12
50	20-60	25-80	12	13

Above 300 words (or above 250 with Pica type): Two-page letter.

Two page letter. Use 250 set up for first page. Leave 1-1 1/2 inch bottom margin. Go down 6 lines to second page notation (Addressee's name, page number, and the date), and then 3 more lines to the body of the letter.

Double-spaced letters: Double the number of words in the letter and fit into the above chart. Only double space very short letters.

16145

TESTS

Business Letters

TEST NO. 1 and 2

Test 1 and 2 should be typed in a 30 minute time limit. After you have typed these letters, proofread them carefully and make the necessary corrections. Hand them to your teacher who will check them.

TEST NO. 1[35]

Type the following letter in Modified Block Style and Block Paragraphs with Mixed Punctuation:

(Current Date)/ Mrs. William A. Buckley/ 519 College Plaza/ Chicago, Illinois 67012/ Dear Mrs. Buckley/ As you walked to the front door to get this letter, did you notice the floor in your entrance hall? It's perhaps the hardest floor in the house to keep clean and bright. No, you can't stop feet from tracking in and out, in and out. There is small wonder that most hall floors look dull and worn before their time! What can you do? (P) You might install permanently beautiful Compo-Roid floors, but perhaps your budget won't permit this at the present time. Then, we suggest the next best thing: Equip your entrance hall and the rooms of your home with Compo-Roid rugs. This is the time to do it, for we have just placed on display an entirely new stock of these modern, smooth-surfaced rugs. They're so attractive, and they're so reasonably priced. (P) If you'll come in, we shall be glad to show these new rugs to you./ Cordially yours/ Oxberry Home Equipment Company/ Alton M. Vessey/ (initials)

TEST NO. 2[36]

Type the following letter in Modified Block Style with Block Paragraphs with Mixed Punctuation:

(Current Date)/ Mr. David E. Penders/ 2746 Fremont Drive/ Springfield, Illinois 67512/ Dear Mr. Penders/ Central's engineering activities are twofold. On the one hand, there is the aeronautical group which is concerned with power plants, aircraft structures, aerodynamics, and electrical applications. On the other hand, there is the airways engineering group which is concerned with airports and building construction. (P) The enclosed booklet contains more detailed information about these two areas./ Very sincerely yours/ Central Airline Corporation/ Director of Public Relations/ (initials)/ Enclosure

[35] Ibid., p. 66.

[36] Ibid., p. 10.

16146

TESTS

Business Letters

TESTS NO. 3 and 4

Tests 3 and 4 should be typed in a 30-minute time limit. Proofread your letters carefully and hand them to your teacher for checking.

TEST NO. 3[37]

Type the following letter in Modified Block Style with Indented Paragraphs with Mixed Punctuation:

(Current Date)/ Kessler Office Supply Company/ 564 Elkins Street/ Montpelier, Vermont 34012/ Gentlemen/ Old friends are essential in any business, but one must get acquainted with new folks to increase the number of old friends. Right? (P) This is a greeting from Dixon-Lamberton and a personal "thank you" for your recent order--your first with us. We appreciate your thinking of us. We hope that you will find the quality of our product and our service so satisfactory that you will call on us often./ Very truly yours/ Dixon-Lamberton Novelty Company/ Millard T. Burgess/ Sales Department/ (initials)

TEST NO. 4[38]

Type the following letter in Modified Block Style with Indented Paragraphs with Mixed Punctuation:

(Current Date)/ American Novelty Company/ 75 East Macon Street/ South Bend, Indiana 50321/ Gentlemen/ The Central Paper Company of your city, our American Bond distributor, has been requested to furnish you with a sample portfolio and other information concerning this exceptionally fine paper. (P) American Bond is not expensive, and yet it has every characteristic of quality. It will render you excellent service, and its attractive appearance will give your correspondence "customer appeal" that cannot be obtained by the use of ordinary bond paper. (P) We hope that you may consider the use of American Bond on some of your future requirements./ Yours very truly/ Collett Paper Company/ Oliver L. Leonard/ Sales Department/ (initials)/

[37] Ibid., p. 33.

[38] Ibid., p. 22.

16147

TESTS

Business Letters

TEST NO. 5

This test should be typed in a twenty-minute time limit. Proofread your letter carefully and hand it to your teacher for checking.

TEST NO. 5[39]

Type the following letter in Block Style with Open Punctuation:

(Current Date)/ Mr. Walter H. Kent, Manager/ Imperial Park Theater/ Park Ridge, Illinois 68034/ Dear Mr. Kent/ Prior to the advent of talking pictures, the theater was chiefly concerned with vision, comfort, and capacity. When, however, talking pictures entered the scene, acoustics became the important factor in theater construction. (P) Because of the theater owner's vital concern in the improvement of acoustical qualities of his building, we had a series of laboratory tests conducted by Dr. Arthur S. Campbell, international authority and writer on acoustics of buildings. His experiments, which covered all types of theater chairs, had for their purpose the determination of relative values and importance in adjusting theater and auditorium acoustics. Exact standards and tables of values have been established. The results of these acoustical experiments are offered to you free of charge and without obligation on your part. (P) Of course, we manufacture and sell chairs, all kinds of chairs, but especially auditorium chairs. We believe, however, that every sale must have the two elements of quality and service. The quality of our product is guaranteed; so you need have no doubt about that element. It is our service element with which we wish to acquaint you. (P) Our acoustical department is equipped to prepare appropriate seating plans, to make acoustical analyses, and to offer suggestions for improvement. If you will send us a blueprint of the floor plan and the side elevation of your theater, we will prepare a diagram showing the width and the location of each chair. This diagram will be sent to you with our comments and suggestions. (P) May we have the opportunity of cooperating with you in the planning of and the selection of your seating equipment./ Sincerely yours/ Simmons Furniture Company/ Leonard M. Simmons, President/ (initials)

[39] *Ibid.*, p. 38.

TRANSCRIPTION

BEHAVIORAL OBJECTIVE:

The student will be able to transcribe on the typewriter designated paragraphs from shorthand plates. She will be able to transcribe each outline accurately.

Each transcription assignment will consist of approximately one typewritten page. A total of 10 points will be given for each assignment with one point deducted for each error. A minimum of six points an assignment will be required to pass. The following will be considered as errors: Placement, not following instructions, misspelled words, type errors, word division, messy erasing, missing words, and additional words. A minimum of 10 passing transcripts will be required.

TEXTS: Gregg Shorthand (D-J Series), McGraw-Hill Book Company
Shorthand Transcription Studies (Fourth Edition D-J Series), South-Western Publishing Company.

Transcription is the ultimate goal of shorthand. The ability to take dictation is of no value unless the dictation can be transcribed accurately. In order to transcribe a student must be able to type, have abilities in English, and must be able to read shorthand notes fluently.

Transcription is a skill and should be developed throughout the entire shorthand course. This skill will be developed by observing the rules of punctuation, grammar, spelling, erasing, proofreading, and by learning to read in thought phrases and by keeping the typewriter moving at an even rate.

To develop this transcription skill, you should spend approximately two periods a week on the transcription lessons and drills. Occasionally your teacher will give you a special timed transcription drill.

The following instructions should be followed when typing transcription drills and lessons:

Drills:

1. Use a 70-space line.
2. If the same line is typed more than once, single space. Double space before starting a new line.
3. Type your name in the upper left corner of your paper.
4. Identify each day's drill with the drill number and date.

Lessons

1. Use a 1 1/2" top margin.
2. Use a 70-space line.
3. Double space and indent five spaces for paragraphs.

161490

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: X. SERVICING

MILESTONE: III. EXHAUST SYSTEM

PERFORMANCE OBJECTIVE NO.: 3 TITLE: Remove and Replace Muffler and Tail Pipe

CONDITIONS:

This assignment will be performed on a complete automobile

BEHAVIOR:

After satisfactory completion of all related training, proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Select proper manual and turn to appropiate chapter
4. Select proper tools and materials
5. Position hoist arms and lift automobile to comfortable working height
6. Remove muffler and tail pipe following all steps as outlined in the manual
7. Install muffler and tail pipe as outlined in the manual
8. Make exhaust leakage test and other checks and tests as outlined in the manual
9. If tests and checks are satisfactory, return tools and materials to proper place
10. Lower automobile to the floor
11. Start automobile and listen for exhaust leaks

PERFORMANCE CRITERIA:

1610

4. Type the following in the upper left corner of your paper:
   Name
   Type and Transcription
   Semester 1
   Assignment No.
5. Type the number of each paragraph to be transcribed before typing the paragraph.
6. If more space is needed, use the back of the paper so that the entire assignment is on one piece of paper.

Follow each step in the unit carefully. However, you must remember that transcription goes along with your shorthand, and you must not attempt to do the transcription lessons outlined below if they are beyond the lesson you are on in your shorthand book. If this point is reached, check with your teacher.

Complete assignments 1 though 7. If at any time you have a question or need help, do not hesitate to check with your teacher.

1. Turn to the brief forms in the back of your book. Read the first line. Make sure that you can spell each word. Type the transcription of each brief form. Follow each word with a comma. If one brief form has more than one meaning, type all meanings, spearating each word with a comma. Repeat this until you can type the entire line with a continuous movement of the typewriter. Be sure to keep your eyes on the shorthand plates. Repeat this procedure for the first three lines.

2. Turn to page 30 in your shorthand book. Transcribe Group A. (Start each number on a separate line.) After transcribing these sentences once, repeat the process two more times. Be sure to read the sentences carefully before you type, making sure that you can spell each word correctly. Keep your eyes on the shorthand plates.

3. Continue this same procedure with Group B and C. This is a transcription drill and this paper should be saved for the next transcription drill and handed in with the production lessons.

4. Turn to the brief forms in the back of the book and type lines four to six, using the same procedure as in Step 1.

5. Read paragraph 28, page 34, in your shorthand book. Check for spelling and punctuation. Transcribe the letter, trying to type smoothly and without hesitation with your eyes on the shorthand plates. Proofread your letter carefully and make any corrections necessary on the typewriter.

6. Transcribe No. 29, page 34, following the instructions in Step 5.

7. Continue the same process for Nos. 30, 31, and 32.

16150

8. Hand in assignments 1 through 7 to be checked.

9. From this point on, each day that is used for transcription, you should drill five to ten minutes on the brief forms at the back of the book and the recall charts in the recall lessons that you have completed, using the same process as outlined in Step 1. These drills should be saved until the page is filled before handling it. NOTE: Do not start each day's drill on a new sheet of paper unless the preceding drill page is full. Put the date at the beginning of each day's drill.

10. Complete the following assignments. Each assignment is approximately one page. If more space is necessary, use the back of your paper. When each assignment is completed, hand your paper in to be checked. Be sure to label each assignment and number each transcription. If a heading is used, it should be centered and typed in capital letters followed by three spaces before typing the paragraph.

The following assignments are from your shorthand book:

1. Transcribe Nos. 40, 42, and 44.
2. Transcribe Nos. 57, 58, and 59.
3. Transcribe Nos. 86, 88, and 89.
4. Transcribe Nos. 105, 106, and 107.
5. Transcribe Nos. 156 and 144.
6. Transcribe No. 173 and 157.
7. Transcribe No. 213.
8. Transcribe Nos. 229, 230, and 233.
9. Transcribe No. 268.
10. Transcribe Nos. 295 and 297.
11. Transcribe Nos. 304, 305, and 307.
12. Transcribe Nos. 323 and 324.
13. Transcribe Nos. 333, 334, and 346.
14. Transcribe Nos. 361, 363, and 365.
15. Transcribe Nos. 381.
16. Transcribe Nos. 398, 399, and 401.

161

Instructions

The following assignments are to be transcribed after completion of Chapter 8 in your shorthand book. These assignments will all be found in the Shorthand Transcription Studies (Green Book). Continue to make all corrections on the typewriter and hand in each assignment as it is completed.

17. a. Type punctuation rule 1 and 2 on page 4. Single space the typing of the rules. Double space between rules. Triple space and transcribe the shorthand notes that follow. Double space the transcription. Triple space.

b. Turn to page 6, Activity 1C, and transcribe the material after following the directions given in the book. Triple space.

c. Turn to page 9, Activity 2A, and type punctuation rule 3 (single space). Triple space after typing the rule and transcribe the shorthand that follows (double space).

18. Transcribe Lesson 3A, page 11 and 12, (double space). Follow the directions given in the book with the exceptions that the notes will not be read and the exercise will not be timed.

19. a. Study the definitions given in Activity 2C, page 11. Transcribe (double space) the material, inserting the correct word given in color. Triple space.

b. Turn to page 5, Activity 18. Do not follow the book instructions. On a page from your shorthand notebook copy the theory three times. Attach this paper to the completed transcript of this assignment. Transcribe (double space) the shorthand plates that follow the theory. Triple space.

c. Turn to page 10, Activity 2B, and follow the same procedure as in Activity 1B.

Hand in your assignment to be checked. Be sure to attach your shorthand notes.

20. a. Type (double space) the punctuation rule 4 on page 15, Activity 3A. Triple space. Transcribe (double space) the shorthand notes that follow, inserting the correct punctuation according to rules 1, 2, 3, and 4. Triple space.

b. Turn to page 16, Activity 3C. Study the words and their definitions. Transcribe (double space) the material that follows. Triple space.

16158131

c. Activity 3B, page 15. On a page from your shorthand notebook, copy the theory three times. Transcribe (double space) the shorthand plates (page 16) that follow the theory.

Hand in this assignment to be checked. Attach your shorthand notes.

21. Transcribe (double space) Lesson 4A, page 17. Insert the correct punctuation where needed.

22. a. Type (single space) punctuation rule 5, Activity 4A, page 19. Triple space. Transcribe (double space) the shorthand notes that follow, inserting the correct punctuation. Triple space.

b. Turn to page 20, Activity 4C. Study the words and their definitions. Transcribe (double space) the material that follows. Triple space.

c. Activity 4B, page 19 and 20. On a page from your shorthand notebook, copy the theory three times. Transcribe (double space) the shorthand plates, page 20, that follow the theory.

Hand in this assignment to be checked. Attach your shorthand notes to this assignment.

23. Transcribe (double space) page 21. Insert the correct punctuation where needed.

24. a. Type (single space) the punctuation rule 6, Activity 5A, page 22. Triple space. Transcribe (double space) the shorthand notes that follow on page 23, inserting the correct punctuation. Triple space.

b. Activity 5B, page 23. On a page from your shorthand notebook, copy the theory three times. Transcribe (double space) the shorthand plates that follow the theory. Triple space.

c. Turn to page 24, Activity 5C. Study the words and their definitions. Transcribe (double space) the material that follows.

Hand in this assignment with your notes attached.

TYPE

Performance Criteria:

At the conclusion of the second semester:

1. The student will be able to pass at least ten 5-minute timed writings with no more than one error per minute.

2. The student will be able to locate, erase, and correct all typing errors made.

3. The student will be able to complete the following production work as set up in each individual unit:

   a. Carbon copies
   b. Envelopes
   c. Letters
   d. Memorandums
   e. Justifying (varifying) lines
   f. Tabulation
   g. Post cards
   h. Telegrams
   i. Manuscripts

Text: 20th Century Typewriting, Eighth Edition, Complete Course. Lessenberry, Crawford, and Erickson. Cincinnati: South-Western Publishing Company, 1962.

Timed Writings

Timed writings will be given at least twice a week. The student will check his papers carefully and circle all errors. Papers that have no more than one error per minute will be considered as passing and will be handed in. The base rate for each student will be figured by the teacher, and the grading scale for these base rates is attached.

Each timed writing should be set up in the following manner:

1. Double space.
2. 70-space line or as directed.
3. Type the following in the upper left corner.
   Name
   Type and Transcription
   Semester II
   Timed Writing
4. Circle entire word where error appears.
5. Record words per minute and number of errors at the top of the page. Example: 50/4

16154

Production

The production work will be done in individual units. The student will obtain each unit from the teacher in the order designated above.

Each student will evaluate his own work. After completing each assignment in the unit, check your paper with the key at the checking table. Evaluate your own work according to the attached sheet. Record the number of errors per page in the upper right corner of each sheet. If you do not understand any part of the lesson, be sure to check with your teacher so that she can go over it with you. It may be necessary to retype the lesson to make sure that you know how to do it.

Keep each assignment in the unit until the entire unit has been completed. After the unit is completed and checked, fill out the printed record sheet. Sample attached. This should be stapled on top of the completed unit and placed in the basket for checking. REMEMBER! Check your work carefully. Be certain that you understand and know how to set up each lesson in the unit because your grade for the unit will be determined from your test scores.

Drills

Each day the student will be expected to spend from five to ten minutes on drill work. These drills should help improve the student's speed and accuracy in typing.

Drills should be chosen according to the type of production work you are doing. Some drills will be included with specific units. In other cases you are to choose your own drills or those drills that will help you the most. You may select drills from your type book or from the various typing drill books on the shelves.

The drills should be typed in the following manner:

1. Type the following in the upper left corner:
   Name
   Type and Transcription
   Semester II
   Drill Sheet
2. Type the date at the beginning of each day's drill.
3. Set margins for each specific drill.
4. In the case of single line drills, type the line at least twice or until you can type it without error. Single space these lines and double space before starting a new one.
5. In drill paragraphs, type the paragraph single space and double space between paragraphs.
6. Do not use a new sheet each day for drill work. Fill both sides of the paper.
7. Hand in drill paper when both sides are filled.

16155

CARBON COPIES

Performance Criteria:

The student will be able to assemble a carbon pack, erase properly on carbon copies, and type carbon copy notations and blind carbon copy notations in the correct place and the correct way. This will be accomplished through the study of rules and typing examples. No test will be given to cover this unit. This is a continuous unit and it is expected that the student will apply the rules learned and practiced here in the units that follow.

- - - -

If you cannot use carbon paper correctly, an employer will not be pleased with your work. Almost all forms and letters must be typed in duplicate, so it is important that you know the correct way to use carbon paper.

Assembling the Carbon Pack

Turn to page 234 in your type book, (Twentieth Century eighth Edition), and read thoroughly how to assemble a carbon pack.

Take your carbon paper that was given to you with this unit and some paper and practice assembling a carbon pack so that you are sure you are doing it correctly. Use some old paper that has been typed on for this practice. Type a line so that you can check to see if it is put together correctly. NOTE: Always double check to see if the carbon is in correctly before you type any assignments.

Erasing on Carbon Copies

Turn to page 140 in your type book and read the rough draft copy on how to erase on carbon copies. This gives a step by step method that you can follow.

After you have read the material, type 89-D, page 140. Follow the book instructions and make certain that you practice what you have read when you make your corrections.

Carbon Copy Notations and Blind Copy Notations

When a carbon copy of a letter is sent to one or more persons, a notation of this fact is made by typing the letters "cc" at the left margin either one or two lines below the reference initials or enclosure notation. These letters are followed by the name of the person to receive a carbon copy.

At times when the sender does not want to reveal this information, the carbon notation is made on all carbon copies, not on the original, and is called a blind carbon copy. This notation is made by typing the letters "bcc" at the left margin either one or two lines below the reference initials or enclosure notation. These letters are followed by the name of the person to receive a blind carbon copy. It is also correct form to type this "bcc" notation one inch from the top of the page at the left margin. NOTE: To type the "bcc" notation, place a file card back of the ribbon and alignment scale and in front of the original copy. After typing, remove the card.

The following are some examples of a "cc" and "bcc" notation.

Top edge of letter

bcc Mr. William Green

July 7, 1968

Parker Desk Company
3357 Martin Boulevard
Anderson, Indiana 46010

Gentlemen:

Thank you for the catalog which we requested. We have had our purchasing department compare your desks with the desks which we had

This year reservations will be made at the Hotel Gibson for all members of the Executive Committee and their spouses--by order of the President.

Sincerely yours,

Lillian B. Constant
Secretary

crl

cc: Miss Janice Graeter, Vice-President
Mr. Fred White, Program Chairman

P. S. Let me know your feelings on the first two items listed above.

bcc Mr. Fred White, Program Chairman

Let me know your feelings on the first two items listed above.

Basic Typewriting Operations

16158

Type the following letter Block Style. Make a "cc" for the office file and one for Mr. George Allen.

August 21, 19--/ Clay & Wrenn Agency/ 2615 Rhode Island Avenue/ Washington 16, D. C./ Gentlemen/ We have just received from our district office at Columbus a latter regarding the May 31 advertisement in the Mansfield, Ohio, "Index," about which we have had considerable correspondence. (P) As we have supposed, the bill for this space was paid locally. A notation to this effect should have been made on the returned invoices. We are very sorry that the omission of such a notation has caused you so much trouble. (P) As the Mansfield matter now seems to be fully settled, we suggest that you close your files on this subject. Thank you for your cooperation./ Very cordially yours/ MOORE ADVERTISING COMPANY/ Arthur Dinsmore

Type the following letter Modified Block Style with indented paragraphs. Make a "cc" for the file and a "bcc" for Mr. Harry Davidson.

November 20, 19--/ Lawrence Machine Company/ 1220 Kearney Street/ Kansas City 14, Missouri/ Gentlemen/ As requested in your letter of November 15, we are sending you a copy of the instruction book to be used with the Piering Calculator. This will give you the information you need. (P) In order to convince you that the Piering will handle your figuring in the most efficient manner possible, we are asking our Missouri representative to call on you when he is again in your vicinity. He will gladly give you further information, and he may be able to suggest some shortcutting methods that will speed up your work. (P) This company is eager to cooperate with you in every possible way. Please, therefore, feel free to write to us about your figuring problems. Our Consulting Department is at your service./ Very truly yours

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: X. SERVICING

MILESTONE: III. EXHAUST SYSTEM

PERFORMANCE OBJECTIVE NO.: 3 TITLE: Remove and Replace Muffler and Tail Pipe

CONDITIONS:

BEHAVIOR:

12. If none are detected, return automobile to proper parking place
13. Remove front seat covers and store in proper place
14. Clean work station for next project

PERFORMANCE CRITERIA:

To be able to satisfactorily remove muffler and tail pipe and check exhaust system for leaks in 2 hours

Learning time: 2 hours

ENVELOPES

Performance Criteria:

The student will be able to type addresses, return addresses, and special notations on both large and small envelopes according to the proper placement and correct rules given in this unit. A test will be given which will consist of addressing 16 envelopes. The time limit on the test will be 20 minutes.

- - - -

The Post Office Department now requires a Zip Code to be included with each address. If no Zip Code is given, look up the correct Zip Code in the book on the reference shelf. If the Zip Code is missing on your assignments, it will be considered an error.

REMEMBER: The inside address of the letter and the address on the envelope must be the same.

Addressing envelopes correctly is very important. It must be done accurately so that the proper person will receive it without delay. Also, the outside of the envelope gives the first impression of the sender.

A cardboard guide of a #10 envelope will be given to you with this unit. For each letter that is assigned to you in any succeeding units, trace this card on the back of the letter you type and address it in the correct manner. If no return address is given, you may use the school address.

Placement of Address.

The two most commonly used envelopes are the No. 6 3/4 (6 1/2" x 3 5/8") and the No. 10 (9 1/2" x 4 1/8").

Envelope Size	First Line	Left Margin
No. 6 3/4 (6 1/2" x 3 5/8")	12 lines from top	5 spaces left of center
No. 10 (9 1/2" x 4 1/8")	13 to 14 lines from top	5 spaces left of center

Style

Most envelopes are typed in block style without punctuation at the end of lines, except when an abbreviation ends a line.

16160

Spacing of Addresses

1. An address should never be typed on less than three lines. If necessary, place the city and state on separate lines.

2. Double space all three-line addresses.

3. Unusually long company names may be typed on two lines; indent the second line three spaces.

4. Single space all addresses of four or more lines.

5. Spell out street names which are represented by the numerals one to ten; use figures for street names represented by numerals of eleven and above.

6. The ordinals d, st, or th may or may not be added to the number that represents street names.

7. Use a hyphen preceded and followed by a space if the street name is a number and there is no intervening direction between it and the house number.

8. When the house number is one digit, spell out "One" but use figures for all other digits.

9. In street addresses, never abbreviate North, South, East, and West; likewise, never abbreviate Street, Avenue, Boulevard, Drive, etc. Never abbreviate the state. (The attached sheet shows the new form that is being adopted in some offices. This is not to be used in your classwork.)

NOTE: For an example of the placement, style, and application of rules, turn to page 173 in your type book.

Assignments:

1. Turn to the attached Addressing Envelopes Guide Sheet and type each rule three times plus the example for each rule once. Single space the typing of the rule. Double space before typing the example. Triple space after the typing of the example.

2. Turn to the attached sheet marked Envelope Addresses and type the addresses in correct form. Type the addresses in two columns on a full sheet of paper. Leave three blank lines between addresses. Set the left margin at 15 and the tab for the second column at 60.

Return Addresses

In most cases businesses have their own return address printed on the envelopes, but when it is necessary to type it on the envelope, it should be typed single spaced in the upper left-hand corner. Begin on the second line space form the top edge and three spaces from the left edge.

16161

Special Notations

a. Mailing directions, such as AIR MAIL, REGISTERED, AND SPECIAL DELIVERY, should be typed on the envelope below the point where the stamp will be placed, approximately nine or ten spaces below the top edge of the envelope. They should be underscored or typed in all caps.

b. Other instructions or special information, such as, ATTENTION PLEASE FORWARD, CARE OF, AND PERSONAL, should be typed in the lower left corner of the envelope, approximately three lines below the last line of the address, one-half inch from the left side of the envelope. Capitalize the first letter of each principal word or type in all caps.

Assignment:

1. Take out your cardboard letter guide and trace two envelopes on a sheet of paper. Type the following addresses, return addresses, and special notations on these two envelopes.

a. The Nordeen Publishing Co., Guerneville, Calif. 90178
From: Madison Business Council, 120 Monona Ave., Madison, Wisconsin 43987. Air Mail and Attention Mr. R. L. Block

b. Mr. Lloyd R. Reardon, Treasurer, Blake, Walsh, and Taylor Co., Inc., 101 Beale St., San Francisco, Calif. 93034
From: International Supply Co., Inc., 463 No. LaSalle St., Chicago, Illinois 64024. Registered and Personal

After you have studied this unit and completed the assignments, check your work with the key and hand your paper to your teacher. If this work has been done satisfactorily, you will be given the test for the unit.

After completing the test for this unit, hand your papers to your teacher for checking. If the work is satisfactory, your teacher will give you your next assignment. If not, supplementary work will be given to you.

ADDRESSING ENVELOPES GUIDE SHEET

1. An address should never be typed on less than three lines. If necessary, place the city and state on separate lines.

Hotel Utah	McCullough Automotive Supply
Salt Lake City	115 East Henderson Street
Utah 84111	Frankfort, Indiana 46041

2. Double space all three-line addresses; single space all addresses of four or more lines.

John M. Byrd and Sons	Mr. Charles D. Wesley Indiana Realty Company
118 North Chestnut Street	2235 South Sunset Street Indianapolis, Indiana 46216
Indianapolis, Indiana 46205	

3. Unusually long company names may be typed on two lines; indent the second line three spaces.

Mr. Arthur H. Lunsford Purchasing Agent Tree Manufacturing Company 115 Gulf Street Houston, Texas 77009	Mr. T. E. Tuckett, President Tuckett and Jones Savings and Loan Association 222 Washington Street Cleveland, Ohio 44121

4. Spell out street names which are represented by the numerals one to ten; use figures for street names represented by numberals of eleven and above.

Salt Lake Realty	Duplicator Supply Company
201 East Third South	258 East 15 Street
Salt Lake City, Utah 84111	Salt Lake City, Utah 84111

5. The ordinals d, st, or th may or may not be added to the number that represents street names.

Merzog Brothers	The Music Center
1505 East 21 South	219 South 15th East
Salt Lake City, Utah 84111	Salt Lake City, Utah 84111

16168

6. Use a hyphen preceded and followed by a space if the street name is a number.and there is no intervening direction between it and the house number.

Ex-Call-O Corporation	Publishers Central Bureau
434 - Tenth Street	33 - 20th Avenue
Buffalo, New York 14211	Long Island City, New York 11101

7. When the house number is one digit, spell out "One" but use figures for all other digits.

Mechanical Pencil Company	Indianapolis Real Estate Association
9th West Ninth Street	One Marshall Avenue
Indianapolis, Minnesota 46203	Indianapolis, Indiana 46209

8. In street addresses, never abbreviate North, South, East, and West; likewise, never abbreviate Street, Avenue, Boulevard, Drive, etc. Never abbreviate the state

Mr. Jesse Knight	Stein-Wiseman Agency
2347 South Leslie Avenue	47 North University Avenue
Carmel, Indiana 46032	Provo, Utah 84601

Envelopes
Test

Directions:

Place your name in the upper left-hand corner of your paper.

Type the correct form of the following addresses. Type them in two columns. Set the left margin at 15 and the tap for the second column at 60.

On the back of your paper trace two large envelopes from your cardboard guide and address them with the first two addresses. Send the first one air mail and personal, the second one special delivery.

Use the school address for the return address.

Weber County High School
1100 Washington Boulevard
Ogden, Utah 84404

You have a 20-minute time limit to complete this test.

1. Mr. Ralph J. Jones, The Thomas Manufacturing Co., 416 Broad Street, Pueblo, Colo. 81009

2. Mr. J. C. Graham, The Baker Co., 361 3rd Ave., N. Y., N. Y. 10016
3. Panther City Office Supply and Equipment Co., 518 18th St., Albany, Ore., 97503.
4. Mr. Harvey L. Cummings, Springfield, Ill., 361 Pine St., 67305
5. Salt Lake Realty, 201 E. 3rd So., Salt Lake City, Utah 84111

GUIDE FOR ADDRESSING ENVELOPES
WHEN USING TWO-LETTER STATE ABBREVIATIONS

1. Block the address lines. Do not arrange lines in an indented form.

Your name Address City, State ZIP Code	Bonneville High School 251 East 4800 South Ogden, UT 84403

2. Single space the address lines, regardless of the number of lines required.

Hotel Utah Salt Lake City, UT 84111	Mr. Charles D. Wesley Indiana Realty Company 2235 South Sunset Street Indianapolis, IN 46216

3. Include a personal courtesy title (Mr., Miss, Mrs., etc.) preceding the name of an individual. The title "Ms." may be used when writing to a woman whose marital status is unknown.

Ms. Dorothy L. Regan 16 Arballo Drive St. Louis, MO 63106	Dr. James R. Walsh 2016 Broadway Indianapolis, IN 46227

4. Place an executive's title or official position, which follows the name of the individual, in whichever of three positions that will provide the best balance; on the line with the person's name, separated from it by a comma; on a line by itself; or on the second line with the company name, separated from it by a comma. Unusually long firm names may be typed on two lines; indent the second line three spaces.

Mr. Arthur H. Lunsford Purchasing Agent Tree Manufacturing Company 115 Gulf Street Houston, TX 77009	Mr. T. E. Tuckett, President Tuckett and Jones Savings and Loan Association 222 Washington Street Cleveland, OH 44121

4. Type the name of the firm just as it appears on the letterhead. The word incorporated, however, is always abbreviated and preceded by a comma. Use amperstand (&) and the abbreviation for company (Co.) whenever they are used as part of the name.

Lawton, Higgins & Fulton 543 North Mississippi Avenue St. Louis, MO 63114	Weston Electronics, Inc. Market and Walnut Streets Long Beach, CA 90813

16167

6. Avoid abbreviations. Type out North, South, East, and West; likewise avoid abbreviating Street, Avenue, Boulevard, Drive, etc. However, it is sometimes permissible to abbreviate these words in order to balance the address block. When a ZIP Code is included, use two-letter state abbreviations.

Mr. Jesse Knight
2347 South Leslie Avenue
Carmel, IN 46032

Stein-Wiseman Agency
47 North University Avenue
Provo, UT 84601

7. Spell out street names which are represented by the numerals one to ten; use figures for street names represented by the numerals of eleven and above.

Salt Lake Realty
201 East Third South
Salt Lake City, UT 84111

Duplicator Supply Company
258 East 15 Street
Salt Lake City, UT 84111

8. Use a hyphen preceded and followed by a space when two consecutive numbers are used to designate the address. It is not necessary to use a hyphen when street names are represented by the numerals one to ten. The ordinals d, st, or th may or may not be added to the number that represents street names.

Ex-Cell-O Corporation
434 Tenth Street
Buffalo, NY 14211

Publishers Central Bureau
33 - 20th Avenue
Long Island City, NY 11101

9. Spell out the house number "one," but use figures for all other house numbers. The first number in an address is always the house number.

Mechanical Pencil Company
6 West Ninth Street
Indianapolis, IN 46203

Indianapolis Real Estate Association
One Marshall Avenue
Indianapolis, IN 46209

10. Place an attention line on any line of the address block above the street name. Do not include an executive's title when a specific name is used.

Acme Jewelry Co.
Attention Mr. James Wilson
301 Hartford Avenue
Buffalo, NY 14223

Wilberford, Inc.
Attention Personnel Director
P.O. Box 95
Norwood, OH 45212

16168

11. Place on-arrival directions like "Confidential," "Personal," "Hold for Arrival," or "Please Forward" four lines below the return address. These directions may be either underlined or typed in all capitals.

12. Place notations involving special mailing services like "Special Delivery" or "Airmail" Below the stamp position and at least three line spaces above the envelope address. These notations should be typed in all capitals.

BUSINESS LETTERS

Performance Criteria

At the conclusion of this unit you will be able to set up a business letter in an attractive and acceptable style. You should be able to type the letters in "mailable" form; that is, correct as to placement, typing, grammar, and punctuation. You should be able to proofread your work and make the proper corrections in a neat manner.

A test will be given at the end of the unit which will consist of typing letters in "mailable" form. These letters will be typed in the various styles covered, including carbon copies, special notations such as carbon copies, subject lines, attention lines. The time limit will be set at approximately 10 minutes per average length letter.

- - - - - -

You have already completed the unit on business letters including the modified block with indented paragraphs, the modified block with block paragraphs, and the block style. This unit will introduce the indented style, the two or more page letter, and the double space letter. However, for the production work be sure to follow directions carefully as to the style of letter indicated.

Follow the steps in this unit carefully. Remember to proofread your work and make all necessary corrections. These letters should be typed with the "mailable" goal in mind.

An envelope for each letter should be traced on the back of the paper and addressed according to the rules set up on your "Addressing Envelopes Guide Sheet."

1. Indented Letter Style. Refer to the indented letter style attached to this unit and study it carefully. The indented style is not used as often as the other styles you have studied, but is still used in some offices. Note: Each line in the inside address is indented five spaces from the beginning of the preceding line. Also, in the closing, start the complimentary closing at the center point and indent each of the following lines five spaces.

2. Type the following medium length letter in the Indented Style with Mixed Punctuation. (Remember: A colon follows the salutation and a comma follows the complimentary close.)

16171

(Current Date)/ Northern Electric Company/ 607 Dickinson Street/ Bismarck, North Dakota 34015/ Gentlemen/ Our local office at 225 Livingston Avenue, Bismarck, has been informed of your request for an opportunity to try some of your actual figure work on the Piering Calculator. That office will give you cheerful assistance. (P) You will be greatly pleased with the Piering, as it handles every type of figuring problem with a maximum of ease and simplicity, permitting a great many short-cutting operations. Our Consulting Department, too, is at your service for help and suggestions in solving caluclations which at the time may appear difficult. (P) You will hear from our Bismarck representative without delay. We are pleased to have this privilege of serving you./ Very truly yours/ Piering Calculators, Inc./ George O. Standing/ Advertising Director/ (initials)[1]

3. Type 66-C, Problem 1, Page 104 of your type book, using the Indented Style with Mixed Punctuation. Make one carbon copy.

4. Attention Line. When a letter addressed to a company is intended for a specific person's attention, an attention line is placed between the inside address and the salutation. Double space between the inside address and the attention line and between the attention line and the salutation. In the block style letter, the attention line starts at the left margin. In the modified block or indented styles, it may either start at the left margin or be centered.

5. Type the following letter in Modified Block Style with Indented Paragraphs and Mixed Punctuation. Include one cc for file and a bcc.[2]

(Current date)/ Bryant Tire Sales Company/ 2378 East Fifth Street/ Newburgh, New York 12550/ Attnetion Sales Manager/ Gentlemen/ It will pay you and your customers who plan to keep their cars for another year or more to learn about our new 4-Ply Federal Tire. (P) A tough 4-ply Nylcon-cord body gives the Federal Tire new skid resistance and a remarkable decrease in road noise. (P) The Federal Tire has been constructed with SAFETY in mind: More road-gripping rubber and more gripping edges for quick response on wet or dry surfaces. No wonder we can give a 36-month guarantee on Federal Tires! (P) Mr. Thomas Wallace, the Federal Tire representative in your area, will call on you within the next week or ten days to discuss the merits of this great new Federal Tire. Sincerely yours/ W. J. Cummings/ Sales Manager/ (initials)/ bcc Mr. George W. Smith

6. Subject Line. This indicates the subject matter of the letter. The subject line should be typed two spaces below the salutation and have two spaces follow it before starting the body of the letter. It may start at the left margin, be indented the same as the paragraphs, or be centered. It may be in all capital letters, or it may be underscored with only the principle words capitalized. Sometimes Subject: or In re: precedes the actual subject.

---

[1]Bowman, Wallace B, Business Letter Typing (Cincinnati: South-Western Publishing Company, 1957), p. 27.

[2]Liguori, Frank, et. al., Basic Typewriting Operations--Principles and Problems (Cincinnati: South-Western Publishing Company, 1965), p. 51.

6172

7. Type the following letter using the indented style with mixed punctuation. Center the subject line and type it in "caps." [3]

(Current Date)/ Miss Mary L. Dolan/ 764 Hillside Avenue/ Charlotte, North Carolina 61023/ Dear Miss Dolan/ Your Order of September 5 (subject line) (P) As orders are usually shipped on the date on which they are received, your order of September 5 had already been mailed to you when your letter of September 6 reached us. (P) If it is now too late for you to cancel the order with the Burton Company and you cannot use the music that we sent you, it may be returned to us for credit. Very sincerely yours/ Raleigh Music Company/ Thomas E. Perkins, Manager (initials)

8. Postscripts. Points which have been forgotten in dictation or purposely withheld for emphasis may be added at the bottom of a letter in a postscript. Indention of a postscript follows the indention style of the letter. Postscripts are preferably typed without the letters "P.S." at the beginning, but this is a matter of choice.[4]

Example:

---

be one that they will remember all their lives. We must not let them down. We know that you will do what you can to help.

Sincerely yours,

Secretary

JIR/jc

Enclosure

We shall send you our summer camp pamphlet soon. This pamphlet shows, in pictures, the highlights of these summer camps. You will enjoy it, I am sure.

---

9. Notations such as airmail, special delivery, etc., should be placed between the date and the inside address and typed in "caps."

10. Two- or more-page Letter. Most business letters consist of one page; however, occasions arise when a longer letter is needed and it is carried on to the second or third page.

---

[3] Bowman, op. cit., p. 29.

[4] Liguori, op. cit., p. 52.

16173

In setting up a letter of more than one page you should follow, in general, the placement chart of the long letter. In carrying the material over to a second or third page, you should observe the following practices:[5]

1. Never carry over to a second page material that will occupy fewer than two lines.
2. Unless at least two lines of a paragraph can be written at the bottom of a page, the whole paragraph should be carried over to the next page.
3. Only one side of a sheet of paper should be used for a letter. When a letter consists of two or more pages, the second and following pages must match the first in size, color, and quality of paper.
4. The first page of a letter may carry the printed heading of the business, but all subsequent pages should be written on blank paper. In order to avoid problems in both the mailing and the filing departments of a business, the subsequent pages should carry an identifying heading showing the name of the addressee (the person to whom the letter is written), the number of the page and the date on which the letter is written. Either of two forms may be used:

Mr. Edward J. Patterson 2 Date

or

Mr. Edward J. Patterson
Page 2
Date

Note: "Patterson" is the name of the addressee (the person receiving the letter, and not the name of the writer.)

The heading of the second page should be written one inch from the top edge of the paper. The message should be continued three lines lower.

11. Turn to Page 179 in your type book and type Problem 8. Follow the directions printed in red. (Note: There is an attention line, subject line, and a postscript in this letter).

12. Type the following 2-page letter in Block Style with Mixed Punctuation. To determine where to stop on the first page, let the bottom margin approximately equal the left margin. Remember that at least two lines must be carried to the second page. Use either form for the second-page heading.

16174

[5] Bowman, op. cit., pp. 44-45.

(Current Date)/ Globe Leather Stores/ 452-454 Madison Avenue/ New York, New York 10002/ Attention Sales Managers/ Gentlemen/ Subject; Kangaroo Leathers/ We would like each of you--and your staff of salespeople--to have some information about kangaroo leathers that will help our project to increase sales of kangaroo leather goods this year. (P) Besides being the most durable of the leathers, kangaroo is especially recommended for its light weight, flexibility, scuff resistance, and suppleness. These qualities have long made it a favorite material for athletic shoes, and the introduction of luster finishes in recent years has added much beauty to its other advantages. As a result, kangaroo leather is a growing favorite among a number of shoe manufacturers. (P) Kangaroo is different from most leathers in that, like pigskin, there is no separation of layers. The fibers of the skin are intermingled from the grain (outer) side to the flesh side, and the skin is never split but used in its full thickness. (P) Kangaroo has been tanned commercially since 1890's; and it has reached such a point of popularity that demand sometimes exceeds supply, particularly since the number of kangaroos killed each year is strictly regulated by the Australian government. The great demand coupled with restricted killing of kangaroos makes kangaroo leather very expensive. (P) Kangaroo is, therefore, limited primarily to better-grade footwear. But even though shoes of kangaroo leather cost more, the fact that they retain their appearance and are so long-wearing--yet comfortable--make them preferred by a growing number of customers. (Start page 2 here) (P) The home office wants every salesperson to become familiar with this leather, so that Globe Leather Stores can lead the race in leather sales./ Sincerely yours/ Globe Leather Stores, Home Office/ Leonard R. Webb, Vice-President/ (initials)[6]

13. Double Space Letters. Extremely short letters, such as a routine letter known as a "letter of transmittal," look best if double spaced. Start the inside address 10 or 11 spaces below the date and use a 40-space line. Double spaced paragraphs are always indented. Single space and block the inside address and double space the body of the letter.

14. Type the following letter in Double Space Style with Mixed Punctuation:[7]

(Current Date)/ Mr. William J. O'Brien/ O'Brien Engineering Company/ 225 Hemingway Road/ Louisville, Kentucky 40207/ Dear Mr. O'Brien/ We are returning your blueprint No. 789345-B, as requested in your letter of March 9./ Very truly yours/ John F. Melvin/ Purchasing Agent/ (initials)/ Enclosure

14. Letter of Application. One of the most important business letters you will ever write is the letter of application.

The purpose of the application letter is to introduce yourself and try to obtain a personal interview. If this letter is to represent "you," great care should be given in typing and setting it up. The letter should not be too long and should "look" good.

---

[6]Liguori, op. cit., p. 60.

[7]Ibid., p. 45.

16175

A personal data sheet, in which you summarize your education, experience, training, personal qualities, and give references, should be attached to your letter. This should also be typed with great care and should be accurate.

16. Turn to Page 214 in your type book and type the letter of application. Follow the directions given in the book.

17. Type the data sheet on Page 215 of your type book to enclose with your letter of application. Type the data sheet as directed.

18. Type the following letters in good form. Choose any of the styles that we have covered this year. Be sure that they are well-balanced. Proofread your work carefully and make all necessary corrections.

(Current Date)/ Mr. Stanley F. Merrill/ 12 South Broad Street/ Richmond, Virginia 30214/ Dear Mr. Merrill/ Please accept with our compliments the assortment of Cranefield's YORKTOWN pencils which are being sent to you by separate mail today. Open your package with the full assurance that they represent the acme of quality in drawing pencils. (P) YORKTOWN is called "the master drawing pencil" because of its effectiveness in the hands of architects, engineers, and artists. Wherever the drawing board or the easel is found, you will find the YORKTOWN. All over the world this pencil is used by the most exacting critics, who accord it the recognition which is due superior merit. (P) The reputation of Cranefield's YORKTOWN as a pencil for draftingroom and studio use is the direct result of the patience and expert knowledge that the Cranefield Company puts into the making of each one of the 17 superb YORKTOWN degrees. (P) Try the samples, and then read the enclosed booklet, "Finding Your Pencil." When you have done this, you will know whether or not we have sent you the leads that you require; and you will also know what other leads to ask for in case the samples are not just what you desire. (P) It is Cranefield's desire and intention to meet your needs and to satisfy you in every possible way. Let us serve you through your local dealer. You may use the enclosed business reply card to give us his name and address./ Sincerely yours/ Cranefield Pencil Company/ Howard R. Hall, Sales Manager/ (initials)/ Enclosure.[8]

(Current Date)/ Dr. George L. Dobson/ 762 Professional Building/ Olympia, Washington 20013/ Dear Doctor Dobson/ You are undoubtedly familiar with the fact that one per cent of Western Gelatin dissolved and added to milk not only prevents excessive curd formation in the stomach, but also increases the available nourishment of the milk, making it more digestible and assimilable. Many physicians are using this with good results in infant feeding and for undernourished children. They also find it helpful in tubercular diets and for patients who are underweight or of low vitality. (P) In many diets, Western Gelatin is found to be exceedingly valuable, because it is so adaptable in combining with other nutritious foods. An endless variety of dishes may be prepared with it to vary

---

[8]Bowman, op. cit., p. 36.

16176

monotonous diets. (P) You will find Western Gelatin decidedly helpful in a liquid diet. It not only adds nutritious value as a supplementary protein, but aids the digestion and absorption of other foods by its colloidal and emulsifying action. As a liquid diet is used chiefly in conditions requiring a maximum amount of nutrition with a minimum tax on the digestive tract, we believe you will find Western Gelatin indispensable./ Very sincerely yours/ Western Gelatin Company/ Merle B. Collins, President/ (initials)[9]

(Current Date)/ Mr. Clyde O. Vines, Chairman/ Business Education Department/ William H. Lane High School/ Seattle, Washington 21301/ Dear Mr. Vines/ For some months we have been preparing an informal correspondence manual based on our own needs. We have made selections from standard manuals, and we have adapted them to the circumstances in this company. Illustrations have been taken very largely from our own experiences. (P) These sheets have been issued irregularly, the time depending on the pressure of other work in this department. Believing that you will be interested in our enterprise, we are enclosing several issues. As you will see, some of the bulletins are intended maily for dictators; others, chiefly for stenographers and transcribing-machine operators. (P) After you have read these bulletins, we shall appreciate your opinion of them. Of course, we intend eventually to bind them in a complete office handbook./ Very cordially yours/ Associated Canneries, Inc./ Richard S. Terry/ Correspondence Supervisor/ (initials) Enclosure/ bcc Mr. John A. Moore/ [10]

19. After completing and checking all the letters in this unit, hand them to your teacher. If your work is satisfactory, you will be given the test for this unit.

20. When you have completed the test, hand your work to your teacher to be checked. If you have completed your work satisfactorily, you will be given your next assignment.

TESTS

Tests 1, 2, and 3 will have a time limit of 10 minutes each. You will be allowed 15 minutes on Test No. 4. (45 minutes in all)

TEST NO. 1[11]

Directions: Type the following letter in Block Style with Mixed Punctuation. Make one carbon copy and an envelope.

(Current Date)/ Dr. T. James Crawford/ Graduate School of Business/ Indiana University/ Bloomington, Indiana 47401/ Dear Dr. Crawford/ Congratulations on your appointment to the staff of the Business Education Department of the Graduate School of Business of Indiana University. We are happy to welcome you and your family to Bloomington. (P) We invite you to open a charge account with us. All you need do is visit our credit department on the third floor any business day. With your permission, we will place your name on our list of customers to whom the privilege of a preferred charge account is extended. (P) You will enjoy, we feel sure, shopping at our store, with its quality goods and a staff of trained salespeople to serve you. (P) We hope you will join our many satisfied customers. You can be certain that we will try to please you in every way./ Very truly yours/ Bernard Gleason/ Credit Department/ (initials)

TEST NO. 2[12]

Directions: Type the following letter in Modified Block style with Blocked Paragraphs with Mixed Punctuation. Make one carbon copy and a blind carbon copy and an envelope.

(Current Date)/ Mr. and Mrs. Edward James/ 2943 Blue Haven Terrace/ Cincinnati, Ohio 45238/ Dear Mr. and Mrs. James/ Thank you for the opportunity to tell you about our program of arts and crafts for adults. (P) Leisure-time hobby classes for men and women will open at the Tri-State Arts and Crafts Center, 2101 Madison Road, the week of September 9 and will continue through December 7, with recess Thanksgiving week. (P) Last year, enrollment in the classes reached a total of 2,400 for the fall, winter, and summer terms. This year we will not be able to accommodate more than 700 for each session. (P) Mr. Fritz Koch is supervisor of all hobby classes, which include drawing and painting, portrait and figure drawing, oil painting, watercolor, toleware and tray painting, and ceramics. (P) If you would like to know more about these hobby classes, write or call us at the above address./ Sincerely yours/ Modern Art, Incorporated/ William Johnson, Director/ (initials P. S. Our supervisor, Mr. Koch, has just returned with some intriguing new ideas from an arts and crafts show at New York's Colosseum. We shall try to arrange for him to present them to our classes soon./ Blind carbon copy to Mr. Fred J. Grove

PERFORMANCE OBJECTIVE STATEMENT

SCHOOL: PETERSBURG FEDERAL REFORMATORY

CURRICULUM: VOCATIONAL

CLUSTER: AUTOMOTIVE

PROGRAM: AUTOMOBILE MECHANICS

MODULE: XI. TROUBLE SHOOTING AND TUNE-UP

MILESTONE: I. IGNITION AND CARBURETION

PERFORMANCE OBJECTIVE NO.: 1 TITLE: Creating Malfunctions and Finding and Correcting

CONDITIONS:

This assignment will be performed on a complete automobile, engine on stand, and any other gasoline powered equipment available. To make this phase of training more realistic and more interesting, trainees will work in pairs. One creating a defect with the other finding and correcting it. Students will change places so both will become proficient at trouble shooting and tune-up work.

BEHAVIOR:

After satisfactory completion of all related training; proceed as follows:

1. Place protective covers on front seat of automobile
2. Move automobile into proper work station
3. Raise Hood
4. Place protective covers on fenders (Omit steps #1 - #4 on all equipment other than cars and trucks)
5. Select proper manual and turn to appropiate chapter
6. Select proper tools, testing equipment, and materials
7. Trainee #1 will create malfunction
8. Trainee #2 will find and correct malfunction
9. Trainee #2 will create malfunction
10. Trainee #1 will find and correct malfunction
11. Each trainee will create and correct an equal number of malfunctions as listed below:
    a. Primary ignition wiring 4
    b. Secondary ignition wiring 2
    c. Ignition coil 1
    d. Distributor 3

PERFORMANCE CRITERIA:

1613

TEST NO. 3[13]

Directions: Type the following letter in Modified Block Style with Indented Paragraphs and Mixed Punctuation. Make one carbon copy and an envelope.

(Current Date)/ Mr. James L. Vincent/ 708 Russellwood Avenue/ McKess Rocks, Pennsylvania 15136/ Dear Mr. Vincent/ It is a pleasure to make new friends--and we are counting you as one of ours. (P) The order you sent us yesterday gives us the pleasant feeling that we have begun a business friendship. We will try to make it a lasting one, through high quality products and outstanding company service. (P) We are certain that Purity Products will move as rapidly in your store as they do in most of the retail stores we serve throughout the country. Our salesman, Mr. George Braidic, will call on you soon. You will find him a good friend, ready to serve you at all times./ Yours very truly/ Purity Products Company/ George V. Bayly/ Sales Manager/ (initials)

TEST NO. 4[14]

Directions: Type the following 2-page letter in the style of your choice. Make an envelope, but no carbon.

(Current Date)/ Mr. Harry H. Raye, President/ Sandra Manufacturing Co./ 924 West Fourth Street/ New York, New York 10003/ Dear Mr. Raye/ Will your company profit when the nation's specialty stores spend $424,000,000 to build and equip the planned 430 new units and 195 remodeled units during next year?/ (P) These 430 units mean a 15.2% increase over the 2,828 stores now in operation and an increase in expenditures of almost $60,000,000 over the past year. This is proof of a fast-moving, big-spending field. It is one that must be kept up with to maintain your own sales increases this year. (P) How? On March 10, RETAIL NEWS will publish another milestone first: a definitive study of fisturing and equipment practices in the specialty field. It will overflow with information on shelving, gondolas, wall units, tables, carts, labeling and signing, checkouts, general equipment, and more. It will have a wealth of never-before-published data on this important area of specialty store operation. (P) It has every indication of becoming the planning guide for specialty store capital goods buyers and for busy presidents, vice presidents, and general managers--men your salesmen cannot always get to see. (P) Can you turn this to your advantage? (P) If more retail store business is part of your sales strategy (and why not?), this is the one issue that must represent your company. (P) RETAIL NEWS boasts the largest paid circulation in the field. More important, it reaches into both buying levels: head-quarters, where executives, merchandise managers, and capital goods buyers actually do the ordering; and the stores, where managers and department heads have their say about the kind of fixtures and equipment they need to best sell their merchandise. (P) The editorial atmosphere of the March 10 issue will be ideal for a presentation of your sales message. (P) You can be sure of prime positioning if you make your reservation early. Why not today? (P) Closing date for the March 10 issue is February 20. So fill in and mail the enclosed postage-paid card now. Sincerely yours/ George R. Dennis/ Advertising Manager/ (initials) Enclosure

16'80 Trial

MEMORANDUMS
(Interoffice Correspondence)

Performance Criteria

At the conclusion of this unit you will be able to type a memorandum or interoffice correspondence in the correct form in a prescribed time limit.

You will be given a test which will consist of typing three memorandums within a thirty minute time limit. These will be set up according to the directions given in the unit as to placement, accurate typing, punctuation, spelling, etc. Neat erasures will be allowed.

- - - - - - -

An interoffice memorandum is used for correspondence between departments or persons in the same organization. A memorandum contains certain guide words. If they are not printed on the forms (most companies have their own interoffice memorandum forms printed), they must be typewritten.

If you have to type your own forms, the following may be used as guides:[15]

1.

Date:

To:

From:

Subject:

2.

To: From:

Subject: Date:

3.

To: Date:

From: Subject:

NOTE: The guide words may be typed in all capitals.

16181

[15] Ibid., p. 74.

The following general instructions should be followed in typing memorandums:[16]

1. Type the information two spaces after the colon of the longest guide word. Double space between guides. Capitalize each major word in the information.

2. Generally, personal titles (Mr., Mrs., Miss) are omitted if the first name is used.

3. Omit the salutation and the complimentary close.

4. Triple space (leave two blank lines) between the heading and the body of the memorandum.

5. Single space the paragraphs, double space between paragraphs.

6. If the name or the initials of the writer is typed at the end of the memorandum, double space between the body and the name. Generally, however, the name is not typed and the memorandum is not signed.

7. If reference initials are used, double space between the typed name (if it is used) and the reference initials, or between the body and the reference initials when a typed name is not used.

8. For all notations, such as "enclosure," "cc," or "bcc," follow the instructions given for letters.

9. Margins:
   a. If guide words are printed, the left margin of the body is generally even with the left margin of the typed material in the heading.
   b. If guide words are typewritten, the left margin of the body is even with the left margin of the guide words. Adjust the margins according to the length of the memorandum.
   c. Paragraphs may be blocked or indented.

10. Review page 269, 183-C in the type book.

Follow the instructions given in typing the memorandum lessons in this unit.

1. Type the following memorandum. Use your own initials for reference:[17]

Date: (Current Date) To: Department Chairmen From: Henry G. Carroll, Principal Subject: Report on Examination Grades
Each chairman is to submit a report on the mid-year examination results in each subject in his department by February 5. The report should combine all sections of the subject and should include the following information;

16101

[16] Ibid., p. 74.

[17] Ibid., p. 77.

16182

1. Total number of students instructed.
2. Total number of students examined.
3. Total number of students passing the examination.
4. Percent of students passing the examination.
5. Total number of students failing the examination.
6. Percent of students failing the examination.

Please attach to the report a copy of each examination administered. Carroll (reference initials).

2. Type the final copy of the following memorandum rough draft:[18]

Date: March 18, 1968 To: All Salesmen From: Andrew Douglass, Sales Manager Subject: New Advertising Campaign

Next week our new advertising campaign for the new Zesty toiletries line will break in the trade journal Retail News with a two-page, four-color spread. This publication is the leader in the field and is read by all your potential customers.

Two weeks later, our advertising campaign form the general public will break with a uniform ads in all the leading magazines. A tear sheet of ~~these~~ this ads is enclosed so that you may show it to your customers.

Everything is being done at this end to promote the Zesty line to the consumer and to the retailer. It is your responsibility to promote it with your customers.

Start those orders rolling in. Remember--a special bonus on this one! (reference initials and enclosure)

3. Turn to page 269-70 in your type book and type the memorandum illustrated.

NOTE: This is a long memorandum and so two forms must be used if the short memorandum forms are printed. In this case, type "page 2" in the "subject" space provided on the second form. Some offices provide the full sheet memorandum forms for long memorandums.

On this memo a file number is included--the form provided does not allow for a file number and so you may omit it.

---

[18] Ibid., p. 79.

4. After completing the memorandums, check them carefully and make all necessary corrections. Check them with the keys. Hand them to your teacher. She will check them and if they have been typed correctly, you will be given the test for this unit.

5. After typing the test, hand your papers to your teacher to be checked. If you have typed these satisfactorily, you will be given the next assignment.

(Second Semester)

MEMORANDUMS

TESTS (Form will be provided)

1. Use the current date. Use your own reference initials. Type in proper form. Do not type the words that are underscored.

   Memo to Paul W. Graham, Training Bureau From Simon V. Johnston, Vice-President on the subject of Houston Converence
   I noted in an article in Junior Executive magazine that the University of Houston will conduct a conference for a week this summer for directors of office training. It seems to me that it might be wise for us to have you or a member of your staff take part in this program. New Paragraph Please write to the University and obtain full details. When you have them, please draft for me an estimate of what it would cost for us to send someone to this conference. If possible, let me have your report w ll before the first of March.
   S. V. J. (reference initials)

2. Use current date. Use your own reference initials. Type in proper form. Do not type the words that are underscored.

   Memo to N. P. Montclaire, Bureau of Personnel From Simon V. Johnston, Vice-President on the subject of New Kinds of Tests at sometime in the near future, Nate, please try to set up a meeting at which you, Miss Benz, Mr. Clark, and I could spend an hour or two in conference with Dr. Mark Bjorgens, of Hilton College, to talk about the tests we give to job applicants. New Paragraph Doctor Bjorgens has just wound up a long study on the values of some new kinds of tests for predicting the success of new office workers. From what I have been told, his findings should be of keen interest to us. We may ask him to review the tests we are now using.
   S. V. J.

3. Use current date. Use your own reference initials. Type in proper form. Do not type the words that are underscored.

   Memo to Ewell Blackstone, Art Department From George McAdams, Advertising Department on the subject of Art for McCalls Advertisement Thank you for letting me know about the delay in getting the art ready for the special McCalls campaign. I got in touch with the magazine as soon as I received your note and found we could have an extension of a week in the deadline. New Paragraph Even so, we shall have to move with dispatch in getting the art finished and the plates made. I hope it will be possible for you and your staff to place a high priority on the job for us. Thank again for your help. We appreciate it very much. McAdams

(Second Semester)

JUSTIFYING LINES

At the conclusion of this unit you will be able to "justify" lines in a given problem. That is, you will be able to type so that the right margin of your work is even, just as the left margin is even. No test will be given for this unit inasmuch as the assignments will be tests in themselves. All lines should be aligned at the right margin and the typing accurate to be satisfactory. Neat erasures will be allowed.

- - - - - - -

Justifying (or varifying) the right margin means making the right margin straight and even. You may be asked to "justify" the margins of a letter, or the margins of a document that have to look extremely neat and symmetrical, such as copy for a school magazine, and special papers that are to be lithographed or mimeographed.

There are three ways to make lines end evenly at the right margin:[19]

1. You may sometimes change a word or a sentence so that all your lines will come out even. Authors do this from time to time to make their lines come out even.

2. You may put some extra spaces between the words, to spread them out so that they fill lines evenly. When you do this, try to avoid putting the extra spaces of one line directly under those of the preceding line.

3. You may spread or squeeze some words, if you prefer, thus stretching or condensing a line to make it fit.

   In all cases, you must type a line first, then see how much space is to be saved or added, and then type it over with all the lines "justified."

Follow the steps in the instructions carefully so that you will be able to "justify" lines correctly. This is interesting work to do and <u>it is not hard</u> if you take the time to follow each step.

<u>Be sure to check with your teacher if you need help.</u>

1. Turn to Page 176-77 in your type book and read Problem 6. Follow the directions given at the top of Page 177 and type the work asked for.

2. After completing Problem 6, Page 176-77, check with your teacher to make sure you are doing the work correctly.

3. Type the following lesson by "justifying" the lines. Spread the heading, use double space, center your work horizontally and vertically on a full sheet of paper.

(Be sure to attach your worksheet to this lesson when you hand it in).

SALE[20]

We are pleased to tell our regular customers that we have just received a special shipment of 300 suits made of imported British tweed. The suits are of all sizes, are styled in the fashion of today, are all wool. Because we obtained this shipment at a great bargain, we shall be able to offer the suits at less than half the price for which they were intended. A public sale of these wonderful tweeds will begin in two weeks. We thought you would be pleased to come in before then, while there is still a wide selection. Thank you.

THE PARKER-HALE COMPANY

4. Type the following copy justifying the right margin. Use a full sheet. Type it double space, indent five for the paragraphs, use a 40-space line, center it horizontally and vertically. (Attach work sheet).

The FAIRLEIGH COMPANY is pleased to welcome you to its staff. Our company is young, but it is growing rapidly and offers many opportunities to those who may wish to work for advancement. We sincerely hope that you will be happy with us and your associates; you have within you the capacity to help both the Company and yourself to build and to prosper.

The purpose of this booklet is to describe for you the Fairleigh products and how you contribute to them, and tell you about Fairleigh policies and how they contribute to you and your career. If other questions occur to you for which this booklet provides no answers, please do not hesitate to phone or stop by to see us so that you can get the answers.

PERSONNEL DEPARTMENT[21]

[21] Ibid., p. 283.

16187

5. Type the following copy justifying the right margin. Center it horizontally and vertically on a full sheet of paper. Use a 50-space line, double space, indent 5 spaces for paragraphs.

THE EDITORIAL STAFF of this issue of Remember Central! wish to acknowledge their deep gratitude to Miss June Shawe for the innumerable hours and ideas that she, as sponsor of this yearbook, contributed to this volume, to the editorial staff, and to the class whose history is recorded here. We are more than merely appreciative; we are inspired. We are more than merely grateful; we are resolved that her example of rich devotion to others and to their interests will stay before us always, an example to be remembered and emulated.

To MISS JUNE SHAWE, this yearbook is respectfully, and affectionately, dedicated in the hope that these lines will assure her that her contribution has served a worthy cause.

THE EDITORIAL STAFF[22].

6. After completing these lessons, hand them to your teacher for checking. (Be sure to attach your worksheet for each lesson). Proofread your work carefully and make the necessary corrections.

[23]

3. To type a boxed table: A boxed table is one with both vertical and horizontal ruled lines. Correct boxing divides the columns and headings, but does not close in the sides.

When drawing the horizontal lines, extend them about 1/4 inch beyond the actual width of the table.

4. Type the following example of a boxed table. Use a half sheet of paper. Leave 6 spaces between columns.

L E A G U E S T A N D I N G S

(As of February 8)

	Won	Lost	Per Cent
Woodlawn	9	3	.75
Montclair	8	4	.67
Freedom	8	4	.67
Dumont	7	5	.58
Greensburg	5	7	.42
DeLong	4	8	.33
Parksburg	4	8	.33
Brooker	3	9	.25

[24]

[23] Ibid., p. 114.

[24] Ibid., p. 117.

16190

5. Typing leaders in tables. In typing leaders, strike the period and space bar. To align the periods, note whether you are typing on odd or even numbers on the cylinder scale when you type the periods for the first line. Space once before starting the leaders. The right margin should be even.

6. Turn to page 81 in Basic Typewriting Operations: Principles and Problems (Red drill book) and type Problem 32. Follow the directions given in the book.

7. Turn to Page 336 in your type book and type Problem 2. Set this Income Statement up in correct form.

8. Tables in themes and other reports. In typing a table within a theme or report, note whether the report is to be bound at the left. If so, then you must remember that headings must be centered over the line of writing just as you did in manuscript writing.

9. Turn to Page 51 in Statistical Typing with Tabulation Problems (green drill book) and type Problem 1. Follow directions given in the book. This might not fill the full page because this is just part of a report.

10. Typing Tables Sideways on the Paper. When a tabulation requires a great many columns, it may be typed on a sheet turned lengthwise in the typewriter. This provides 51 vertical spaces (on regular typing paper 8 1/2" x 11") and 132 horizontal spaces (elite type).

11. For this problem, use either the electric typewriters or the Olympia typewriters. Turn to page 92 in Basic Typewriting Operations: Principles and Problems (red drill book) and type Problem 60. Follow the directions given in the book.

12. After completing No. 11, check your work carefully and make any corrections necessary. Check your work with the key and hand it to your teacher.

13. If your production work for this unit has been satisfactory, you will be given the test for the unit.

14. After completing the tests for this unit, hand them to your teacher for checking. If you have typed these satisfactorily, you will be given your next assignment.

TEST NO. 2

Directions: Set up the following report. The report is to be bound at the left. Double space the body of the report and single space the tabulation. Triple space between the textual matter of the report and the table. Allow a 1" top margin. Assume that this is page 3 of the report. Time limit: 20 minutes.

Unfortunately, work standards cannot be readily established on a nationwide basis for the wide variety of jobs found in business offices. Some efforts have been made by national associations to set standards on certain of the more common kinds of work; however, these will prove of reference value only to supervisors and others engaged in the setting of standards. Some standard time allowances which have been found to exist in a composite of business firms may be of interest. These time allowances are given in the table below:

TABLE VI

STANDARD TIME ALLOWANCES FOR TYPICAL OFFICE JOBS

Kind of Work	No. Per Hour

POST CARDS

Performance Criteria:

The student will be able to type a message on a post card and address a post card in correct form which is outlined in this unit. A test will be given which will consist of typing and addressing three post cards. A time limit of 30 minutes will be given for the test. Neat erasures will be allowed.

- - - - - - - - -

The following are some rules for typing and addressing post cards:

Addressing the Card

1. The return address is to be blocked and single spaced in the upper left corner of the card. Start typing on the third line from the top and the second space from the left side of the card.

2. Begin the address a triple space below the printed address indentification and five to eight spaces left of center. (Begin the address below the "f" in "of" of the printed identification).

3. Use block form in typing the address. Double space a three-line address; single space a four-line address.

Typing the Message

1. Type the date on the third line.

2. Leave a one-half inch margin at each side. (There are 20 lines down a post card and 66 elite and 55 pica spaces across).

3. Do not type a return address or an inside address on the message side.

4. Triple space between the date and salutation, triple space between the body and the name and title of the person sending the message. A complimentary close is not necessary but may be used if the message is not too long and there is room on the card. If used, the complimentary close is typed a double space after the body.

16198

1. Using the forms attached, type the following message according to the rules given above.[31] To: Miss Mary Johnston/ 2345 Howard Street/ Mentor, Ohio 44060/ Return Address: Business Service Club/ Mentor High School/ Mentor, Ohio 44060. Use current date and block style. Dear Mary:/ This is just a reminder that the Decoration Committee of the Annual Dance will meet on Thursday in Room 215 at 3 p.m. This is the last time we will be able to get together before the decorations will have to be placed in the gym./ Sincerely,/ Helen Carroll, Chairman.

2. Turn to page 81 in your type book. Type 50-C, Problem 2. Follow the directions in your book and use the school as the return address. Use the form attached.

3. Type Problem 5, page 296. Do not follow the book instructions. Use the form attached. Directions: Address a post card and type the message to Thomas P. Kuchel/ Hillcrest Road/ Ft. Thomas, Kentucky 74810. Use the school address for the return address. Use the current date and type the message as given in the book.

After completing the production work in this unit, check your work carefully with the key and hand your papers to your teacher. If this work has been done satisfactorily, you will be given the test for this unit.

After completing the test for this unit, hand your papers to your teacher for checking. If your work is satisfactory, your teacher will give you your next assignment. If not, supplementary work will be given to you.

Post Card

Test: The following test is to be completed in a time limit of 30 minutes.[32]

1. Address the post card and type the message to Miss Linda Terrill/ 3827 Par Hills Drive/ Covington, Kentucky 41011. Use the current date and Weber High School for the return address. Dear Linda/ Our Music Club has 40 tickets for the opera FAUST for Friday, June 28, priced at $2.30 each. The first 10 people to purchase these tickets will be allowed a discount. Their tickets will cost only $2 each. (P) You like opera, I know; so join us on June 28, won't you? I'll hold a ticket for you./ Maria Bueno/ Secretary.

2. Center both vertically and horizontally the following announcement on a post card. Double space. Be sure to center each line horizontally. Address the post card to Mr. Arthur Dawson/ 3690 Harrison Boulevard/ Chicago, Illinois 87654.

   THE ACADEMIC HONORS SOCIETY
   announces
   Free Tutoring for Juniors and Seniors
   in
   Physics and Mathematics
   Wednesdays and Fridays
   3:45 to 5:15 p.m.
   Rooms 103 and 105

3. Address a post card and type the following message to Miss Mary W. Keane/ 1047 East Third Street/ Reno, Nevada 89503. Use the current date and your own address for the return address. Dear Miss Keane/ The next meeting of the Finance Committee of the Alumni Association will be held at 8:30 p.m., Saturday, December 10. It will be held at the home of John F. Elkins (1200 West 21 Street). The agenda includes a study of the finance plan for the Alumni House, a matter so important that committee members are urged to attend./ Richard Carlson/ Executive Secretary.

TELEGRAMS

Performance Criteria:

The student will be able to type a telegram in a set time limit in correct form according to the rules set up for sending telegrams. A test will be given which will consist of typing four telegrams in a time limit of 30 minutes. Neat erasures will be allowed.

Telegrams are a type of dispatch communication that are used within the country. The urgency of the message determines the type of dispatch communication that is used, such as, letters, telegrams, telephone calls, etc.

Telegrams include the following classes: full-rate telegram, day letter, night letter.

A full-rate telegram is the fastest and most commonly used and is utilized for urgent messages. This type of telegram is transmitted without delay and is delivered immediately upon arrival at destination. (This is the most expensive).

The day letter is slower and less expensive than a full-rate telegram. It is delivered the same day that a person sends it.

A night letter is third in order of speed. It is delivered the following morning. These messages are accepted any time during the day or night up to 2 a.m. for delivery the following morning.

For the following assignments telegram forms will be provided.

1. Turn to page 266 in your type book. Read 181-C thoroughly and follow along with the example given.

2. Type 181-D, page 267, Problem 1 and 2 and 3. Note: Do not type the zone number given in the book. Type the Zip Code number instead.

3. Type the following telegrams as per instructions given:

   a. The following telegram is to be sent as a DAY LETTER. Use your own reference initials and charge this telegram to J. C. Bolton, Incorporated.

      Ogden, Utah 84401/ Current Date/ Louis Parke, Editor/ Stationers' Journal/ 2300 J. Street/ Washington D. C. 10011/ Am mailing today the article you requested. Hope it will serve your purpose. This purchase should be the wisest investment you have ever made./ Edward Bolton/ J. C. Bolton, Incorporated.

162015029

b. Send the following telegram FULL RATE. Use your own name and the name of the school as the signature line. Use your initials as the reference initials and charge this telegram to the school.

Salt Lake City, Utah 84301/ Current Date/ Mrs. Carolyn Hungerford/ Board of Education/ St. Louis, Missouri 64288/ Regret my inability to participate in your survey of business-training program. Explanatory letter follows.

c. Send the following telegram as a NIGHT LETTER. Use Mr. Jones' initials as reference initials. Charge it to the sender and the sender's address is to be transmitted.

Omaha, Nebraska 11111/ Current Date/ Supreme Manufacturing Company/ 6495 Prairie Avenue/ Chicago, Illinois 32201/ Your shipment of 1969 automobiles should arrive at your showroom within the next five days. Order delayed because of the recent railroad strike. Regret this slight delay./ Mark Paul JOnes, President/ Humbolt Automobile Company/ 14511 Lake Shore Drive/

d. The following message is to be sent FULL RATE. Charge it to the Union School District and use your own initials as reference initials. Do not transmit the sender's address.

Miami, Florida/ Current Date/ Mr. Lloyd R. Reardon, President/ Blake, Walsh, and Taylor, Inc./ 101 Beale Street/ San Francisco, California 94356/ Wire best price on 20 dozen #83 carbon paper. Also wire earliest shipping date/ R. L. Landers, Treasurer/ Union School District/ 1469 Terrace Road.

After completing the assignments in this unit, check your work carefully and hand your papers to your teacher. If this work has been done satisfactorily, you will be given the test for the unit.

After completing the test for this unit, hand your papers to your teacher for checking. If the work is satisfactory, your teacher will give you your next assignment. If not, supplementary work will be given to you.

Telegrams
Test

Follow the instructions for typing each of the telegrams listed below. Forms will be provided. You have a time limit of 30 minutes to complete this test. Neat erasures are allowed.

1. Type the following as a night letter. Charge the message to the National Fiber Company. Use your own reference initials. Use the current date.

Houston, Texas 54888/ Continental Distributors, Inc./ 5634 Middleground Road/ Savannah, Georgia 76810/ On March 24 the Memphis plant shipped Invoice #163028 for American Weavers, Inc., New Orleans, Louisiana, in Crate #17, weighing 329 pounds. A shortage of Item Z-29 has been reported. Investigate details of claim and report findings. Also report the re-weight on the merchandise./ Paul Smith

2. Type the following as a day letter. Charge the message to Hartwell Supply Company. Type your own reference initials and use the current date.

Spokane, Washington 94560/ McGlaze Manufacturing Company/ 624 West Jackson Avenue/ Chicago, Illinois 68790/ Please Cancel our Purchase Order #10832 mailed to you yesterday. We cannot use the goods that were written on that order. They are not adequate for our purpose. New order will follow with a new Purchase Order. Will contact you on this new order in the near future./ Kevin Gregory.

3. Type the following as a telegram. Charge the message to Manufacturers Institute. Type your own reference initials and use the current date. Transmit the sender's address.

New Orleans, Louisiana 43233/ Dr. Robert Rafael/ School of Business/ Wayne University/ Detroit, Michigan 87560/ Editorial Board has authorized new edition of your book. How woon can we have manuscript? Need it by next week on Thursday./ Donald Bideaux/ Manufacturers Institute/ 4053 Park Hills Drive.

4. Type the following as a telegram. Charge the message to United Steel Institute. Type your own reference initials and use the current date.

Salt Lake City, Utah 81101/ Dr. Maurice Trethaway/ School of Business/ University of Illinois/ Champaign, Illinois 54433/ New Simpson edition delayed until May 1. Shall we fill order with present edition?/ Donald Burt, United Steel Institute.

(Second Semester)

MANUSCRIPTS

Performance Criteria:

At the conclusion of this unit you will be able to type a table of contents with leaders and a manuscript with footnotes and quotes in correct form in 45 minutes. You will also be able to type a rough draft manuscript and a bibliography in correct form in 45 minutes.

- - - - - - -

During this unit you should drill at least five minutes each day to increase your speed and accuracy in typing. Use the drills in your type book and select those that will help you the most.

Proofread carefully and check your papers with the key. All of the material in this unit should be handed to the teacher when you complete the unit.

If any questions arise, do not hesitate to ask your teacher.

- - - - - - - -

Follow the listed instructions step by step to develop your skill in manuscript typing.

1. Review the sheet in this packet called Word Division Rules for Typewriting. Type 99-C, #3, page 157. Follow the book directions.

2. On your drill sheet for your 5-minute drill, type 99-C, #2, page 156. If you have already typed your drill for today, use this for your tomorrow's drill.

3. Type 99-C, #1, page 156. Follow the book instructions.

4. Many college reports or research papers include quotations from other authors or references. These must be typed in the correct way in the manuscript. The following rules can be used as a guide:

   a. A quotation of <u>three</u> or fewer lines is displayed by being typed within quotation marks.

   b. Longer quotations are given special attention by single spacing and indenting five spaces from the regular margins on both sides. In some instances quotation marks are used around the quotations which are indented, however, when you indent quotations in manuscripts, it is preferred to omit the quotation marks.

   <u>Remember</u>: Commas and periods are <u>always</u> typed inside the quotation marks.

16204

c. The omission of words from a quotation is called ellipsis and is shown by three alternating periods and spaces, or four if the end of a sentence is included in the omission.[33]

For practice on each of these rules type the following. This may be done on one sheet of paper.

a. So began a three-day battle between the old man and the big fish. The old man had to battle thirst and hunger, and loss of sleep, too, and the pain of cut and bleeding hands and cramped fingers. Pain did not matter--a man could endure; and defeat he never admitted. "Man is not made for defeat," he said. "A man can be destroyed but not defeated."[1] [34]

b. Type the first three paragraphs of Problem 1, 60-C, page 96.

c. Type 56-D, page 91. Follow the book direct ns.

5. Type 58-C, Problem 1, page 93-94. Do not follow the book directions. Assume that this manuscript will be bound at the top. Type it according to correct manuscript form. If necessary, refer to your rules for manuscript form.

6. Type 145-D, page 212. Make up and type in your own page numbers. The following are some general rules for typing a table of contents. Use these as your directions for this problem.[35]

a. Use a full sheet of paper.
b. Center the exercise vertically.
c. Use the same margins as your report or manuscript. (For this problem, assume it is to be bound on the left).
d. Center the title over the line of writing.
e. Center the problem horizontally.
f. Triple space between the title and the word Page, double space before and after main headings in the table.
g. Indent and single space the secondary headings.
h. Separate the headings from corresponding page numbers with leaders (periods and spaces alternately typed). Align subsequent rows of leaders by noting whether the first line is typed with the periods on odd or even numbers and maintaining the same placement for each line. Leave a blank space before the first period and at least one after the last on each line.

7. Type the following problem and center it vertically. Use margins for a manuscript that is to be unbound.

8. A bibliography is a listing of all references used in the preparation of a manuscript. It may also be a general listing of references on a particular subject. The following is a guide to typing a bibliography.[37]

a. Use the same margins for the bibliography as for the body of the manuscript.
b. Start a bibliography two inches from the top of the page.
c. Center the heading "Bibliography" according to the writing line of the report. Triple space (leave two blank lines) after the heading.
d. List references alphabetically by author.
e. Double space between references. If a reference covers more than one line, single space the reference.
f. Start the first line of the reference at the left margin; indent five spaces for all other lines in the reference.
g. A reference to a book consists of the name of the author or authors (last name first), the title of the book, the place of publication, the publisher, and the yar of publication.
h. A reference to an article consists of the name of the author or authors, the title of the article, the title of the publication, the volume number and the date of publication, and the pages on which the article appears.
i. Titles of books and names of periodicals are typed in all capitals, or underscored with the first letters of major words capitalized.
j. The titles of magazine articles are placed in quotation marks.

Test No. 2

Directions: Type the following material in manuscript form. This manuscript is to be sidebound. The time limit for this test is 30 min.[40]

Title: Work Organization

One of the goals of the efficient office worker is good work organization. When a person has learned to organize his work, he has solved one of the difficulties of the working world. Littlefield and Peterson emphasize the importance of work organization when they say:

> Many firms are in a static condition simply because the executives in charge lack organizing skill. This lack of skill may result in improper balance among the departments of the organization; in some departments being over-supervised and others being under-supervised; in problems arising due to an absence of clear-cut lines of authority; in disputes among personnel; in employees bypassing their supervisors; and in employees taking orders from more than one supervisor.[1]

The executive has his problems with organization. The office worker below the executive level must also concentrate on organization. First of all, he must take a positive attitude toward unfinished work. Unfinished work at the end of a day is depressing and frustrating: To have to stop work before finishing is upsetting to efficiency and disposition. Even children at play are goal-motivated, and it is asking too much of them to quit play instantly to come in for dinner. The wise parent asks the child to come in as soon as there is a stopping place in the play. So it is with adults, too. Workers are irritated if they are pulled off a job before they have finished. Unless it is an emergency, the wise boss advises the worker to fit in other work as soon as possible. Sometimes, moreover, an emergency may mean that the boss himself has done some poor planning! Interrupted work is unfinished work. Long visits, needless phone calls, unnecessary requests for help--all produce annoyance rather than efficiency. Necessary interruptions should be made with consideration to the worker. As a matter of fact, people who do not mind interruptions are not likely to be goal-motivated. (P) On the other hand, time for rest and peace is necessary. Every minute from arising to retiring cannot be used for productive effort: Overwork makes people go stale. (P) Time spend in waiting ordinarily should be neither rest nor relaxation. The efficient person has the habit of thinking about his work and planning ahead during the times he has to wait. This type of worker plans what to say to his employer and how best to say it, or he reviews his work methods with the aim of improving them. (P) A successful man who started out as an office boy and later formed a large company gives this advice: "The young man who spends his spare moments with greatest profit to himself will be able to sell his working hours in later life at the greatest profit."

Test #3

Directions: Type the following rough draft material in manuscript form and make all corrections indicated. This manuscript will be topbound. The time limit for this test is 30 minutes. Remember to type the footnote in the proper place.

ADVERTISING AS A CAREER

~~A number of~~ Many people in the field of advertising are chiefly creative--the writers and artists. Some are active salesmen ~~and~~ who sell space, time or supplies. Others ~~do work in~~ analyz~~ing~~e and study~~ing~~ markets ~~or~~ research media to see what is going on in the world. Some ~~work in~~ manag~~ing~~e ~~and~~ coordinat~~ing~~e the work of others. Most jobs, in point of fact, call for ~~some~~ combination of these talents in what is considered one of the most important phases of ~~business~~ selling.

Toone, Simon, and McGill say ~~that~~

> By far the most important form of sales promotion is advertising. This paid form of publicity is used to create a demand for a product and stimulate business. It is also an informative and educational force that aids the consumer in making judgments and adds to his standard of living.[1]

Even though ~~the~~ work in advertising is varied, people who have done well in ~~the~~ field ~~of advertising~~ have ~~as~~ at least three traits in common: They like to solve problems; they are interested in people and things. They are all sales-minded. ~~Many people~~ Workers in other ~~work~~ lines have these traits, too, but ~~the~~ successful men and women in this field need them in large measure.

First, the person in advertising must like to solve problems. Often facts ~~must~~ have be gathered ~~to~~ and define the problem. A course of actions must be recommended, ~~and after it is~~ put into effect, ~~it must be checked~~ the results appraised and from time to time, to reappraise ~~the result~~. Sometimes even excellent work can be improved.

Second, the person should be sales-minded. He must think in terms of persuading people, ~~he must~~ present ideas in ways that will appeal to their interests.

16210

233 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

Test #3
Page 2

The third ~~big~~ outstanding trait of advertising people is a great interest ~~in people and things and~~ in mankind, as well as the workings of business. The ~~hope of the~~ advertising man is to present a selling message in ways that draw attention, arouse interest, create a desire for the products, and persuade people to buy ~~it~~ them. He should be a salesman with a broad background in ~~a lot of the~~ varied subjects, ~~which he can take in school,~~ one both practical and cultural. A This background is shaped by his personal experiences, the courses he took in school, and his hobbies and other outside activities. It reflects the kind of young man he was and determines the kind of older man he will become.[4]

TRANSCRIPTION

BEHAVIORAL OBJECTIVE:

The student will be able to transcribe on the typewriter designated material from shorthand plates. She will be able to transcribe each outline accurately.

Each transcription assignment will consist of approximately one typewritten page. A total of ten points will be given for each assignment with one point deducted for each error. A minimum of six points an assignment will be required to pass. The following will be considered as errors: placement, not following instructions, misspelled words, type errors, word division, messy erasing, missing words, and additional words. A minimum of 18 passing transcripts will be required.

Texts:

Gregg Dictation (D-J Series), McGraw-Hill Book Company
Shorthand Transcription Studies (Fourth Edition D-J Series), South-Western Publishing Company

This unit is to help you further develop your transcription skill in both speed and accuracy. Keep in mind how important transcription is. The completed transcript, such as a "mailable" letter, is your ultimate goal to become an efficient secretary.

Follow the directions carefully. Being able to follow directions and work on your own are two qualities essential in obtaining and maintaining a good position.

Transcription drills should be continued as in the first semester. You may continue to use the brief forms in the back of your book, theory review at the beginning of each lesson, and the recall drills of word beginnings and endings and phrases that appear in the back of your book, pages 504 to 511. You will also be given a variety of drills throughout the following assignments. You will be expected to drill five to ten minutes each day on these transcription drills. Hand your drill paper in when both sides are full.

The following assignments are to be completed during this semester. Assignments from your shorthand book (Gregg Dictation D-J Series) can only be completed as you finish each chapter. Assignments from the transcription book (Shorthand Transcription Studies--Fourth Edition, D-J Series) should be worked on throughout the semester.

After the completion of each assignment, hand it in to be corrected.

DO NOT HESITATE TO CHECK WITH YOUR TEACHER AT ANY TIME IF YOU HAVE A QUESTION.

16213

ASSIGNMENTS

From the shorthand book

Use a 70-space line. Double space. Leave a one and one-half inch top margin. If an assignment takes more than one page, use the back of your sheet to complete it. REMEMBER--Always type the heading in all capital letters. Triple space after the heading. Type the following in the upper left corner of your paper: Name
Type and Transcription
Semester 2
Assignment No.

1. Transcribe #39, page 44-45.
2. Transcribe #79, page 76-77.
3. Transcribe #116, page 104-105.
4. Transcribe #156, page 136-137.
5. Transcribe #196, page 170-171.
6. Transcribe #235, page 200-201.
7. Transcribe #273, page 230-231.
8. Transcribe #310, page 258-259.
9. Transcribe #350, page 286-287.
10. Transcribe #387, page 314-315.
11. Transcribe #426, page 344-345.

16214

From the Shorthand Transcription Studies Book

Even though the following assignments are listed in groups, one group does not have to be completed before starting a new group. To be more interesting, it is suggested that you intersperse the assignments listed as Spelling Demons, Punctuation Study, and Word Differentiation with your assignments of Letters, Memorandums, and Outlines.

Remember to indicate your assignment with your heading in the upper left corner.

Spelling Demons, Punctuation Study, and Word Differentiation

DIRECTIONS:

Spelling Demons: Use a 70-space line. Number each sentence and double space. Transcribe the sentences once. The outlines in color represent frequently misspelled words. Use your dictionary if necessary. Don't guess. Triple space before transcribing the Punctuation Study.

Punctuation Study: Use a 70-space line. Type the punctuation rule or rules once single spaced, double spacing between rules. Triple space and transcribe the shorthand notes that follow, using double spacing. Triple space before transcribing the Word Differentiation.

Word Differentiation: Study the words and their definitions. Transcribe (double space) the material that follows. Be sure to select the correct word appearing in the brackets.

12. Transcribe page 128, 31A; page 29, 6A; page 40, 8C.

13. Transcribe page 131, 32A, page 34, 7A; page 48, 10C.

14. Transcribe page 135, 33A; page 42, 9A; page 54, 11C.

15. Transcribe page 138, 34B; page 47, 10A, page 61, 13C.

16. Transcribe page 141, 35A; page 53, 11A; page 71, 16B.

17. Transcribe page 180, 46A; page 67, 15A; page 87, 20B.

18. Transcribe page 182, 47A; page 70, 16A; page 102, 24B.

19. Transcribe page 187, 48A; page 94, 22A; page 149, 37A.

20. Transcribe page 190, 49A; page 97, 23A; page 156, 39A.

21. Transcribe page 193, 50A; page 101, 24A; page 158, 40A.

16215

Memorandums

Do not do this section until you have completed the unit on office memorandums in your type book.

You may use any of the three styles in your typing memorandum unit for the following memorandums. Use single spacing, double spacing between paragraphs.

22. Transcribe pages 28 and 29, 6D (2 memorandums).

23. Transcribe pages 33 and 34, 7D (2 memorandums).

24. Transcribe pages 81 and 82, 19B and pages 85 and 86, 20D.

Outlines

25. Transcribe page 221, 62A. (Memo to a Secretary). This memorandum gives instructions for the outline that follows.

On a separate sheet of paper, type the outline on page 223 and 224, 63B. Follow the book directions. Staple these papers (Memo and Outline) before handing them in.

Letters

Do not do this section until you have completed the letter unit in typing. AN ENVELOPE SHOULD BE TYPED ON THE BACK OF EACH LETTER. For the return address on your envelopes, use the name and address of your school.

26. Transcribe 12C, Letter No. 2, page 55. Follow the directions given in the book. Choose your own letter style. This is a short letter.

27. Transcribe 13C, Letter No. 2, page 59. Follow the book directions. Type this letter Modified Block with blocked paragraphs.

28. Transcribe 20B, page 84-85. This letter is dictated by Bruce Wade and is a long letter. Type this letter in Full-Block style. In the last paragraph i.e. is used. It should be typed as follows: address, i.e., 8 Blackwell Avenue. (i.e. means, that is).

29. Transcribe the letter at the top of page 120. Use Modified-Block style with blocked paragraphs. Refer to page 118 on how to type the postscript (P. S.). The dictator is Norman W. Quince, President.

16216

30. Transcribe 37B, page 147. Follow the book directions.

31. Transcribe 27C, No. 3, page 112. Use Blocked style. Read 27B, page 111 and 112 before typing this letter. The dictator is E. L. Langley, Credit and Adjustment Department.

32. Transcribe No. 3, page 116. Read 28B, page 115 before typing the letter. The dictator of this letter is Marcella Hogan, Manager, Trade Sales Department. Use Modified-Block style with indented paragraphs.

33. Review 17B, page 73. Transcribe 25A, No. 2, page 104. Use Modified-Block style with blocked paragraphs. The dictator is Peter I. O'Dell, Publicity Manager.

34. Read 22B, page 92. Special Delivery notations, Personal notations, and Hold for Arrival notations are all typed in the same position on the letter as the Air Mail notations discussed in 22B. Transcribe 22D, No. 1, pages 92 and 93. Use Blocked style. The dictator of this letter is M. O. Reid.

35. Read 49B, page 189 for instructions in typing listed material Transcribe 49C, No. 2, page 189. Use Modified-Block style with indented paragraphs. The dictator of this letter is Elvin A. Thomason, Manager, College Sales Department.

INSTRUCTIONS FOR THE TEACHER

Shorthand II is set up to take one-hour's time daily of a two-hour block with Secretarial Procedures. If the two-hour block is not scheduled, the course can be a daily one-hour class.

This course starts with Chapter 12 in Gregg Dictation. Diamond Jubilee Series. If instructional tapes are available. it is suggested that one taped lesson from each chapter be used. After completing Gregg Dictation,the Gregg Speed Building, Diamond Jubilee Series, book is used. No taped lessons need to be given for this book. A test consisting of 50-word theory (words taken from the theory, marginal reminders, and vocabulary builders in each chapter) and a dictated letter from the chapter is given at the completion of each chapter. A sample of a form used for the theory test is included. Homework should be checked at this time.

Word lists of 25 words are given at the beginning of each class period as a theory checkup. No more than two minutes should be allowed for the transcription of these words. Words should be dictated at approximately one word every one and one-half seconds.

The students should be encouraged to spend from 10 to 15 minutes a day on speed development tapes. If no tapes are available, live dictation should be given daily.

A spelling list in 15 groups is attached. It is suggested that spelling tests be given after the student has studied each group. Students are not told in advance when a spelling test is to be given. After a test is given on one group of words, the student should automatically study the next group of words. Other spelling tests can be used; such as, selecting the correct spelling of a word from word lists, proofreading letters for spelling,etc.

Special handouts are attached giving the student information on mailability, transcription rules, special brief forms, and phrases. Students should be encouraged to study these and use them in their dictation and transcription. A list of general instructions for shorthand is included. These instructions should be given to the students at the beginning of the course.

Inasmuch as the students are working individually and at their own rate, a paper should be available in a convenient place where the students can indicate what test (chapter, 100-word theory, brief form, "take" speed) is needed. It is suggested that one day a week be designated as "take" day. All students should take them on this day.

Progress reports are used for students to keep a record of their work. A duplicate of this is also used as a nine-week report to the parents. A copy of a suggested progress report for each semester is included. Note that each required assignment is included on the report, and there is also a place for the signature of a parent.

VT 011 334
Beginning Drafting. A Handbook for Grades Seven and Eight.

Kansas City Public Schools, Mo. Industrial Arts Dept.

MF AVAILABLE IN VT-ERIC SET.
Business Services Division, 601 Board of Education Building, 1211 McGee Street, Kansas City, Missouri 64106 ($1.00).
PUB DATE - Nov58 83p.

DESCRIPTORS - *WORKBOOKS; *INDUSTRIAL ARTS; *DRAFTING; *STUDY GUIDES; ORTHOGONAL PROJECTION; ENGINEERING DRAWING; TEACHING GUIDES; GRADE 7; GRADE 8; TRADE AND INDUSTRIAL EDUCATION; SECONDARY GRADES

ABSTRACT - Developed by a curriculum committee for the Kansas City Missouri Public Schools, this workbook is for teacher and student use in industrial arts drafting courses in Grades 7 and 8. Units are: (1) Freehand Sketching, (2) Charts, Maps, and Graphs, (3) Electrical Drafting, and (4) Freehand Working, Instrument Working, Pictorial, Architectural, Machine, and Sheet Metal Drawings. Each unit contains related general information and assignments. Worksheets for use with this document are available from the source of availability listed above. (GEB)

GENERAL INSTRUCTIONS FOR SHORTHAND I AND II

Supplies

Each student should have the following supplies for his own use at all times:

1. Pen (this need not be an expensive fountain pen--a good ballpoint is sufficient.)
2. Pencil (you should have one with you at all times to use as a spare in case your pen does not write). A pencil will also be used for checking your work and for certain markings.
3. Typing paper (carbon paper will be supplied for you). Have your own.
4. Typing eraser--be sure to have your own. There will be no borrowing of erasers.
5. Shorthand notebooks (one for homework, and one for classroom work).
6. Dictionary (each student must have his own dictionary). This need not be expensive. A paperback edition which costs about 50 cents is very good for your use in class.
7. A folder in which to keep your type paper and assignments. A folder with side pockets is good because it helps keep your papers and work organized.
8. Your textbooks will be furnished. Take good care of them because you will be responsible for them. If they are lost, you will be required to pay for them, and if they are damaged in any way, you will have to pay the cost of repair.
9. Mark all of your own supplies with your name in case you leave them in the classroom. With your name on them they could be returned to you.

Instructions on the Use of Notebooks

1. Keep two notebooks--one for classroom dictation, and the other for homework lessons. Bring both notebooks to class with you each day.
2. In your homework notebook, make certain that you identify each lesson. Also, circle the number of each paragraph as you copy your lesson. This is necessary for reference when you are called upon to transcribe or read from your homework notes.

16221

3. When writing in your notebooks, be sure to go completely through the book on one side of the paper, then turn your notebook over and go completely through it on the other side of the paper. In this way you do not waste paper and it saves time during dictation. When the notebook is filled, keep it for at least one week before throwing it away. You may be called upon to transcribe from your notes that have been written two or three days previously.

4. Keep your notebooks in a definite place on your desk. Then you will be ready to take dictation at a moment's notice, assuming, of course, that you keep a pen and pencil with your notebook at all times.

5. Keep a rubber band around the <u>used</u> portion of your notebook.

6. Place the date and lesson number at the bottom of the first page of the day's dictation or homework lesson.

7. Draw a line through each letter as soon as you transcribe it.

8. When you are interrupted in transcribing a letter, mark your place with a pencil.

9. Leave a space at the beginning of each letter dictated for mailable transcription for special instructions such as mailing directions, multiple carbons, and so on.

10. Write out unfamiliar names in longhand. (Do not do this when taking "takes.")

11. When the boss (or teacher) is interrupted during dictation, use the time to read your shorthand notes, improving outlines and inserting punctuation.

12. Indicate the end of each item in some way such as by a wavy line.

13. When it is necessary to take dictation on loose paper, fasten the notes in the proper place in the notebook for later reference.

14. Learn to turn pages in your notebook while taking rapid dictation.

<u>Timed Writings</u>

Timed writings will be given at least once a week as a class to measure your typing speed and accuracy. Additional timed writings will be given individually as requested.

Your papers should be set up as follows:

16221

16222

1. Type the following in the upper left corner of your paper:*

*(Shorthand I Students)	*(Shorthand II Students)
Name	Name
Type and Transcription	Shorthand II
Semester 1 or 2	Semester 1 or 2
Timed Writings	Timed Writings

2. Start your timed writing about an inch and an half from the top of your paper.

3. Set your machine for double spacing, 70-space line unless given other instructions by your teacher.

4. Record your words per minute and number of errors at the top of your paper in this manner: 55/4

5. To pass a timed writing, you must not have more than one error per minute.

6. Circle the entire word where an error appears.

7. Hand in "passing" timed writings only. A certain number (shown on your instruction sheets) will be required each semester.

Tapes

Tapes at various speeds are available to help you increase your speed in taking dictation. Regular dictation practice is necessary. You should allow yourself at least 10 minutes a day for dictation.

You will each be given a set of ear cushions for your own use. These should be kept in an envelope, stapled to your folder so that you will have them when you need them. If you lose them, you will be charged twenty cents for a new set. You must use your own set always.

All of the equipment involved in using taped material is expensive. If you are careless with this equipment, it might throw the entire system out and penalize all of the students until repairs are made. Please use the equipment with care.

If at any time your set does not work properly, be sure to report the trouble to your teacher immediately.

Dial the channel for the speed that will help you the most. You should practice at a speed that is a little beyond your ability to write at that time.

Brief Forms

It is necessary for you to know how to write brief forms without

16223

hesitation. Brief forms are words that are used often and have an abbreviated way of writing them. If you do not know these, you will have to write them out according to sound and this, of course, would take too much time. Learn your brief forms well. They are introduced in small groups to enable you to memorize them. You should review brief forms often throughout your study of shorthand to help you increase your ability to take dictation.

One way to help you automatize your writing of brief forms is suggested by Charles Swen, a champion shorthand writer. As a list of brief forms is presented, you take a piece of paper and copy the brief forms in one column. Then transcribe the brief forms by writing the transcription along side the shorthand symbol. After doing this, fold the paper under so that the shorthand forms do not show and then write new shorthand forms along side the longhand transcription. Next, fold the longhand words under and transcribe the shorthand forms. Continue this process until you have used the entire sheet. By the time you have written the brief forms and transcribed them a number of times you will have learned them.

When brief form tests are given, they will be dictated "live" or on tape. The special form to use for these tests will be provided. Transcription will be done on the typewriter. On brief form tests, both the shorthand forms and the transcription will be checked.

Word Lists

Word lists are used as a daily homework theory check. Fifteen to twenty-five words will be dictated by your teacher and should be transcribed on your typewriter.

Type your name in the upper left corner of your paper. Set your machine for double spacing, and set your left margin at 15. Words should be typed one under another in a column. If you cannot transcribe a word, leave the space--you may be able to transcribe it after you have completed the list. If you misspell a word while transcribing, do not erase or "x" out the mistake, just use the space bar and space once and retype the word correctly. You will be timed on your transcription and so you do not want to waste any time. Misspelled words will be counted as errors.

Always have a piece of paper in your machine with your name typed in the upper left corner.

Theory Tests

Tests will be given to test your knowledge of shorthand theory at the end of each chapter. The tests may be transcription from shorthand plates, "live" dictation, or "taped" dictation.

When taking a theory word test from "live" dictation or from "tape" a special form will be provided. You will write the shorthand symbol

16224

as the words are dictated and then be given a time limit for transcription. The transcription should be typed next to the shorthand form. Care should be taken in transcribing these words inasmuch as a misspelled word is counted as an error.

When a 100-word theory test is given, you will need two of the provided forms. These sheets should be stapled together before handing them in, and your name should appear on each page.

Takes

"Takes," three-minute timed dictation at various speeds, will be given at least once a week to help you measure your progress.

The material will be unpreviewed and will be dictated "live" or on tape. You will be allowed twenty minutes to transcribe and the transcription will be on the typewriter.

These "takes" are given to measure your ability to take dictation at a certain speed. Ninety-five per cent accuracy is required to pass a "take." A record of your achievement will be posted on the bulletin board, and you will be required to pass three takes at a certain speed before moving on to the next speed. Each "take" that is transcribed should be handed in to be recorded regardless of whether it is "passing" or not. A record will be kept of the number of errors made so that you will be able to see your progress. Word for word transcription will be required.

Directions for Transcribing "Takes"

1. Type your name, and the speed of your "take" in the upper left corner of your paper.

2. Use a 70-space line with five spaces for paragraph indention.

3. Set your machine for double spacing.

4. Type the salutation on one line followed with a colon:

5. Type the complimentary closing on a separate line followed with a comma. Start the closing at 50.

6. Erasers may be used for corrections.

7. When transcribing, if there is an outline you cannot transcribe at the time, leave a space. When you have completed the transcribing of the letter, if you can fill in the work or words that have been omitted, use the blank space that you have left. If you did not leave enough space for the word or words that were omitted, use the blank space between lines for the insertion.

SHORTHAND II
(First Semester)

Behavioral Objective

At the conclusion of the first semester:

1. The student will be able to pass two 100-word theory tests with at least 90% accuracy. Each 100 words will be dictated in no more than ten minutes and will be transcribed in 20 minutes. Words transcribed incorrectly and misspelled words will be counted as errors. Only the transcription will be checked. The words will cover all phases of shorthand theory.

2. The student will be able to pass at least two 50-word brief form tests with 98% accuracy. The words will be dictated at the rate of one every 1 1/2 seconds and transcribed within a ten-minute time limit. Shorthand and transcription will be checked--each will be worth one point. Misspelled words will be counted as errors.

3. The student will be able to pass at least eight spelling tests of 25 to 50 words with a 90% accuracy. These words will be taken from special spelling lists given to the student to study.

4. The student will be able to transcribe accurately all words in the theory, vocabulary builder, and marginal helps given in each lesson. Tests will be given at the conclusion of each chapter which will consist of 50 words dictated in five minutes and transcribed in a ten-minute time limit. Accuracy of 85% will be required. One letter from each chapter will be dictated at 60 words per minute to be transcribed. Ten points will be given for each letter with a minimum of seven points required. One point will be deducted for each error. These letters should be set up in letter form.

5. The student will be able to pass at least ten 5-minute timed writings with no more than one error per minute.

6. The student will be able to take dictation at the minimum rate of 60 words per minute for three minutes on new unpreviewed material and transcribe the dictation with 95% accuracy in the time limit of 20 minutes. Actual word-for-word transcription will be required.

7. The student will be able to set up business letters in "mailable" form; that is, correct to placement, typing, grammar, and punctuation. These will be transcribed on the typewriter from dictation or from homework notes. She will be able to proofread her work and make neat corrections; with a minimum of 20 required.

Gregg Speed Building (D.J. Series) by John R. Gregg, Louis A. Leslie, Charles E. Zoubek; Gregg Publishing Division, McGraw-Hill Book Company, Inc., New York, New York; 1964

8S0227

Remember to do each lesson carefully so that you can read the material and be able to transcribe your notes. Tests taken from the theory and marginal reminders will be dictated to you. Study these words so that you will be able to use them in your dictation.

The warmup letter at the beginning of each chapter will be used for speed development. Read, copy, and transcribe this letter several times while working on each chapter so that you will be able to take it in dictation at high speeds.

Pay particular attention to the grammar checkup, spelling pointers, and punctuation reviews that are included in each chapter to aid you in your transcription.

Taped instruction of lessons will be used at various intervals. Follow the procedure used in Shorthand I. When taped lessons are not given, allow yourself from 10 to 15 minutes each day for taped speed development. This is necessary if you expect to increase your dictation speed.

Follow the instruction steps carefully. You must complete at least four lessons a week in order to fulful the requirements for the semester. At any time that you have a question, do not hesitate to check with your teacher.

Chapter XII

1. Read your attached sheet on homework and notebooks.

2. Study the theory review in each lesson by reading the words as quickly as you can. Refer to the key for the words you cannot read. Copy the words and see if you can read them back from your own notes.

3. Study the vocabulary builders and similar-word drills carefully. These words will appear in the practice material and will help you in your transcription.

4. Read each letter and copy it at least once. Also copy the secretarial hint called "The Secretary on the Job" at the end of the last lesson of each chapter. Read these articles carefully because the hints given can be useful to you.

5. The transcription letter at the end of each lesson should be read carefully and punctuation inserted as called for in the letter.

6. After you have copied each letter, try to read back from your notes. If you have difficulty reading your notes, you are not copying the material as you should. Take a little more time because copying will do you no good unless you can read your own work.

VT 011 337

7. If a question arises in your mind at any time while doing these lessons, be sure to check with your teacher.

8. Each day you will be given specific material to read and transcribe. Also, vocabulary lists will be dictated daily.

9. On specified days you will complete your lesson through the use of tapes. Refer to your instruction sheet on tapes.

10. At least one day a week will be set aside for "takes."

11. After you have completed each lesson in the chapter, check with your teacher and she will give you the chapter test. Your homework will be checked at this time.

12. After completing the chapter test, hand your papers to your teacher for checking. If you have passed the test within the prescribed standard, you will be allowed to go on to the next chapter.

Chapters XIII through XVI

Follow the steps as outlined for Chapter XII.

At the conclusion of Chapter XVI if you have completed your work satisfactorily, you will hand Gregg Dictation (blue book) in to your teacher and a new book, Gregg Speed Building (pink book), will be given to you.

Gregg Speed Building is designed to help you develop your shorthand skill and your ability to produce letters that can be rapidly and accurately transcribed on the typewriter as mailable letters. At the end of the first four chapters there is a chart of brief form derivatives and on the inside back cover there is a complete list of the brief forms given in alphabetical order. These brief forms should be reviewed continuously to enable you to increase your dictation speed. (At least 60% or more of the words in the average business letter are brief forms.) If you know these, it is not hard to be able to write the remaining words.

Punctuation, spelling, vocabulary building are also included in this book to help you develop your transcription skill.

Most of the lessons in this book contain letters that are in printed form (longhand). You should write each of these letters in shorthand. A preview of some of the words and phrases used precedes the letters.

The practice material in each chapter is devoted to a specific line of business or a specific industry. This material has been chosen not only for its shorthand value but also for its informative value.

Read pages 10, 11, 12 on self dictation. Any dictation practice that you can get, the more rapidly your shorthand speed will increase.

16229

Chapter I

1. Study the punctuation brushup at the beginning of the chapter carefully. This punctuation will be reviewed in the lessons of the chapter. It is very important that you review punctuation and learn to punctuate correctly inasmuch as the letters you transcribe must be mailable.

2. Take each lesson separately, a minimum of one lesson a day.

3. Study the theory review in each lesson by reading the words as quickly as you can. Copy the words and read them back from your own notes.

4. Study the vocabulary builders and the similar-word drills carefully. These will help you increase your vocabulary.

5. Read each letter or article and copy it at least once. In the case of the printed longhand letters, write these letters at least once in shorthand.

6. From time to time your teacher will dictate the progressive speed builder letters found in the last lesson of the chapter. Be sure that you can write these letters so that you will be able to increase the speed as dictated.

7. If a question arises in your mind at any time while doing these lessons, be sure to check with your teacher.

8. You will be asked to transcribe letters from your homework and, also, word lists will be dictated.

9. Remember to use at least 10 to 15 minutes a day on speed development through the use of tapes.

10. At least one day a week will be set aside for "takes."

11. After you have completed each chapter, check with your teacher before proceeding to the next chapter. A 50-word theory test and a dictated letter taken from the chapter will be given at the conclusion of the chapter.

Chapters II through VI

1. Follow the steps as outlined for Chapter I.

16229

TRANSCRIPTION RULES

1. A word that contains a hyphen may be divided only at the hyphen.

2. The hyphen is used in writing certain compound words. Sometimes two or more words are combined to form a compound adjective, thus: up-to-date building; an air-cooled engine; machine-made goods; law-abiding citizens; a first-class job; and out-of-way place.

3. The adjective high-grade and first-class are sometimes used as predicate adjectives, thus: Your equipment is high-grade in every way.

4. Notice that in the following sentences up to date, first class, and high grade are not used as adjectives:

   Up to date we have not heard from you.
   He was a member of the first class that was graduated.
   Have you made a high grade in the examination?

5. Most words that are formed by prefixing self to another word are written with hyphens, thus: self-confidence, self-control, self-evident.

6. Notice, however, that the word selfish and its derivatives are written without hyphens, thus: unselfish, selfishly, selfishness.

7. When you spell out numbers consisting of two digits, use the hyphens, thus: one-half; three-fourths, five-sixths, twenty-two.

8. Compound adjectives are often formed by joining a figure to such words as inch, foot, yard, story. In such cases the compound adjectives should be written with a hyphen, whether the figure is used or whether the number is spelled out in words, thus: a 40-foot frontage, a twelve-foot walk, a four-story building.

9. Here is a list of words that should be written without hyphens:

billhead	nevertheless	today	cannot
outgoing	tonight	bookkeeping	notwithstanding
underwriter	overdue	foreclose	tomorrow
incoming	postscript	warehouse	letterhead
prepaid	wholesale	without	typewrite

10. Always spell out a number when it begins a sentence.

11. As a general rule, spell out round numbers which occur in sentences, thus: The company has about ten thousand accounts.

12. Whole numbers (those that do not contain fractions) of less than 100 should usually be spelled out; numbers of 100 or more should be written in figures. We employ ten stenographers. The book has 212 pages. It has thirty-six pages.

16231

13. When numbers are used in a series, write them in figures, thus: Please order 9 copies of List No. 29, 17 copies of List No. 41, and 103 copies of List No. 7.

14. In legal papers and documents amounts are often spelled out and also written in figures, thus: The total estimated costs are Fifteen Hundred Dollars ($1500). It is not necessary to add .00 for the cents when you write whole numbers in documents or letters. The word Dollars is also capitalized. The amount in figures is written after the word Dollars.

15. Avoid the use of st., th, and d after the figure or number which represents a date, when the date is preceded by the name of the month.

16. When the date precedes the name of the month, add the proper ending, thus: He will arrive the 4th of February. The sale will start the 2nd of May.

17. When the day if given and not the name of the month, spell the number in words, thus: He usually gets here on the third of the month.

18. The ages of people should be spelled in words, unless the exact age is given in years, month, and days. The applicant is twenty-one years old. His age at the time of his death was 69 years, 11 months, and 9 days.

19. Avoid indicating months by figures except in tables and table work. (September 12, 1966 not 9/12/66).

20. In references to price list or catalogue numbers, the abbreviation No. is often used to precede the figure or number. The abbreviation is capitalized.

21. Fractions, such as one-half, one-third, one-fourth should be spelled out when they occur by themselves in sentences.

22. Amounts of money should be written in figures. Remember, however, that figures and numbers cannot begin sentences.

23. Cents may be abbreviated as ¢ or cts. in tabulations. In writing letters, however, abbreviations should be avoided.

24. It is correct to use a figure of a number to precede percent, or cents, thus: Our business shows an increase of 5 percent. The cost of only 7 cents each.

25. Use figures to express street numbers, thus: 1121 Fourth Street.

26. Avoid typing # or No. before street numbers.

27. Spell out a figure or number which precedes o'clock. Use figures, however, when a.m. or p.m. is used.

28. When two numbers come together, one of them should be spelled out, thus: two 5-inch cards.

16231
16232

Shorthand II

SPELLING

A large vocabulary is an asset in both business and social life. It is especially important in business. A good vocabulary is necessary for the understanding of spoken and written instructions, the selection of appropriate words in speaking and writing, and the recognition of misused words when transcribing. However, a good vocabulary will be of no value to you unless you can also spell correctly.

Poor spelling reflects upon your personality as well as on the company for which you work. Employers will not "put up" with the inability of their stenographers to spell correctly and recognize errors.

Most misspelling is due to poor habits. Habits can be changed. It takes work, but you can improve your spelling if you concentrate on doing so.

If you have any question on how to spell a word, do not take a chance. Look it up in your dictionary to be sure. After you have misspelled a word once, see that you do not misspell the same word again. Keep a list of words that trouble you and study them from time to time.

Words that are often misspelled are attached. These words are in groups of 25 for your convenience. You will be given spelling tests by groups from time to time. The following procedure will be used:

1. Study group 1
2. Test on group 1
3. Study group 2
4. Test on group 2
5. Continue through all the groups in this manner

You will not be told in advance when a spelling test will be given. You should automatically study the next group of words after you have been tested on a particular group. You may also be given additional tests on any group of words that you have covered.

The number of passing (90% accuracy) spelling tests required is listed in your Shorthand II instruction sheet.

Remember: It is not enough to be able to spell a word correctly. You must know its meaning and how to use it.

MAILABLE LETTERS

All of the letters you will transcribe will be set up as business letters. Placement of the letter will be determined by its length. Each letter should be typed with the goal of "mailability" in mind. A "mailable" letter is one that is correct as to placement, typing, grammar, punctuation, and correct transcription. It is one that your employer would be proud to sign.

The goal of "mailability" should be kept in mind at all times.

The following will be considered errors:

1. Misspelled words or names
2. Materials omitted or added
3. Careless erasures
4. Serious misplacement
5. Omission of date
6. Transposed words
7. Errors in figures
8. Smudge marks
9. Raised Capital letters
10. Incorrect word division
11. Single line on second page
12. Strike-over letters

Remember, a definite number of mailable letters are required to complete the course.

16237

PROOFREADING CHECK LIST

1. Accuracy of transcript

   Is it an accurate record of the dictation? Are all figures, names, addresses, etc., correct?

2. Sense of transcript

   Have I read for thought to be sure transcript makes sense? Are there any omitted words, lines, or sentences?

3. Directions

   Do I have the right number of carbon copies? Are enclosures included? Have I made special notations such as Special Delivery?

4. Spelling and word division

   Are any words misspelled, such as to for two or expecially for especially? Have I observed rules for word division at ends of lines?

5. Appearance: placement and corrections

   Is arrangement on page attractive? Am I proud of its appearance? Is copy clean? Are corrections hard to detect?

6. Punctuation, capitalization, use of figures, grammar

   Have I checked usages about which I am uncertain?

ADDITIONAL BRIEF FORMS

These are additional brief forms that you may learn <u>if you want to</u>. Some of them could prove valuable to you in building your speed. Learning these <u>is not a requirement</u> and you <u>will not</u> be tested on them.

1. above
2. allow
3. already
4. also
5. altogether
6. always
7. am, more
8. among
9. another
10. answer
11. approximate
12. arrange
13. ask
14. attention
15. because
16. been
17. belief, believe
18. bring
19. collect
20. correct
21. committee
22. confident
    confidence
23. consider
    consideration
24. country
25. definite
26. deliver
27. Dear Sir, desire
28. different
29. direct
30. Dr., during
31. else
32. excellent
33. favor
34. follow
35. friend
36. from
37. gave
38. give
39. go, good
40. individual
41. industry
42. inquire
43. instant, instance
44. invoice
45. knowledge
46. let, letter
47. like
48. long
49. love
50. matter

16239

51. Mr., market
52. most
53. much
54. name
55. necessary
56. nothing
57. office
58. people
59. please
60. point, appoint
61. possible

76. usual, wish
77. want
78. without
79. while
80. yes
81. catalogue
82. against
83. thousand
84. various
85. behind

ADDITIONAL PHRASES

These additional phrases are for you to use <u>if you want to</u>. Phrasing is only valuable if you can write them without hesitation. If you have to stop to decide whether to phrase or not, you could write the words out in less time. You are <u>not</u> required to learn these phrases and you <u>will not</u> be tested on them.

1. of course
2. at once
3. at any rate
4. great deal
5. on hand
6. one another
7. do you know
8. great pleasure
9. your order
10. first class
11. at the same time
12. in other words
13. once in a while
14. in my opinion
15. in the first place
16. over and over again
17. all over - - - -

    all over the city

    all over the world
18. more and more
19. more or less
20. department

    state department

    personnel department
21. quicker than
22. rather than
23. greater than
24. have done
25. has been done
26. will be done
27. would be done
28. should be done
29. extra discount
30. enter the
31. enter into
32. over the
33. under any
34. center line
35. in the world
36. day or two
37. one or two
38. some of them
39. here and there
40. in reply to your
41. question of time
42. in a week or two
43. sooner or later
44. in reference to the matter
45. short time

16241

46. by the way
47. on the question
48. up to the time
49. hand in hand
50. that is to say
51. to me
52. to know
53. in due course
54. what to do
55. I had
56. as soon as
57. as soon as possible
58. as well as
59. as good as
60. as good as
61. as great as
62. as much as
63. in reference to the matter
64. up to the time
65. on the market
66. in the matter
67. hand in hand
68. able to say
69. little or nothing
70. I should like to have
71. I should like to know
72. I hope
73. we hope
74. I am sorry
75. I want
76. you want
77. be sure
78. we are sure
79. I am sure
80. to me
81. to meet
82. to know
83. to make
84. at any time
85. what to do
86. from time to time

SHORTHAND II
(Second Semester)

Behavioral Objective:
At the conclusion of the second semester:

1. The student will be able to pass two 100-word theory tests with at least 90% accuracy. Each 100 words will be dictated in no more than ten minutes and will be transcribed in 20 minutes. Words transcribed incorrectly and misspelled words will be counted as errors. Only the transcription will be checked. The words will cover all phases of shorthand theory.

2. The student will be able to pass at least two 50-word brief form tests with 98% accuracy. The words will be dictated at the rate of one every 1 1/2 seconds and transcribed within a ten-minute time limit. Shorthand and transcription will be checked--each will be worth one point. Misspelled words will be counted as errors.

3. The student will be able to pass at least five spelling tests of 25 to 50 words with a 90% accuracy. These words will be taken from special spelling lists given to the student to study.

4. The student will be able to transcribe accurately all words in the theory, vocabulary builder, and marginal helps given in each lesson. Tests will be given at the conclusion of the chapters which will consist of 50 words dictated in five minutes and transcribed in a ten-minute time limit. Accuracy of 85% will be required. One letter from each chapter will be dictated at 80 WPM to be transcribed. Ten points will be given for each letter with a minimum of seven points required. One point will be deducted for each error.

5. The student will be able to pass at least ten 5-minute timed writings with no more than one error per minute.

6. The student will be able to take dictation at the minimum rate of 80 words per minute for three minutes on new unpreviewed material and transcribe the dictation with 95% accuracy within a 20-minute time limit. Actual word-for-word transcription will be required.

7. The student will be able to set up business letters in "mailable" form; that is, correct to placement, typing, grammar, and punctuation. These will be transcribed on the typewriter from dictation or from homework notes. She will be able to proofread her work and make neat corrections. A minimum of 35 will be required.

- - -

Continue to do each lesson carefully. Be sure that you can read your shorthand notes so that you will be able to transcribe them. Review the theory and marginal reminders in each lesson. Words will be dictated to you from these words. A thorough understanding of the basic principles of shorthand is necessary if you want to increase your dictation speed.

16243

Use the warmup letter at the beginning of each chapter for speed development. See how fast you can read and copy the letter, keeping in mind that you should be able to transcribe your notes.

In order to be able to set up a mailable letter, be sure to study the grammar checkups, spelling pointers, and punctuation reviews in each chapter.

Allow at least 10 to 15 minutes each day for speed development from the tapes. This will help you to increase your dictation speed. During the semester you will continue to take timed writings. Remember that your shorthand skill is no use to you if you cannot type accurately. You should also have a reasonable degree of speed.

Follow the instruction steps as outlined below. Do not hesitate to check with your teacher at any time if you have a question. This semester's work is a completion of your shorthand study. Keep in mind at all times that your goal is to be employable. Your skill will be extremely important to you in obtaining and maintaining a good secretarial position.

Chapter VII

1. Study the punctuation brushup at the beginning of the chapter carefully. This punctuation will be reviewed in the lessons of the chapter. It is very important that you review punctuation and learn to punctuate correctly inasmuch as the letters you transcribe must be mailable.

2. Take each lesson separately, a minimum of one lesson a day.

3. Study the theory review in each lesson by reading the words as quickly as you can. Copy the words and read them back from your own notes.

4. Study the vocabulary builders and the similar-word drills carefully. These will help you increase your vocabulary.

5. Read each letter or article and copy it at least once. In the case of the printed longhand letters, write these letters at least once in shorthand.

6. From time to time your teacher will dictate the progressive speed builder letters found in the last lesson of the chapter. Be sure that you can write these letters so that you will be able to increase the speed as dictated.

7. If a question arises in your mind at any time while doing these, be sure to check with your teacher.

8. You will be asked to transcribe letters from your homework and, also, word lists will be dictated.

9. Remember to use at least 10 to 15 minutes a day on speed development through the use of tapes.

10. At least one day a week will be used for "takes."

11. After you have completed each chapter, check with your teacher before proceeding to the next chapter. A 50-word theory test and a dictated letter taken from the chapter will be given at the conclusion of the chapter.

Chapters VIII through XVI

1. Follow the steps as outlined for Chapter VII.

INSTRUCTIONS FOR THE TEACHER

Secretarial Procedures is set up to take one-hour's time daily of a two-hour block with Shorthand II. If the two-hour block is not scheduled, the course can be a daily one-hour class.

Instructional materials for the course have been divided into fourteen units. These units have consequently been divided into four sections. Each section is equivalent to a quarter of a year. Grades and credits can be given upon the successful completion of a section.

A wide variety of instructional materials have been listed in the "Unit Instruction Sheets" that have been prepared for this course. Copies of the following textbooks should be available:

Agnew, Peter L., et. al. Secretarial Office Practice. Seventh edition. Cincinnati: South-Western Publishing Company, 1966.

Gavin, Ruth E., and William A. Sabin. Reference Manual for Stenographer and Typists. Fourth edition. New York: McGraw-Hill Book Company, 1970.

Gregg, John Robert, et. al. Applied Secretarial Practice. Sixth edition. New York: McGraw-Hill Book Company, 1968.

Lessenberry, D. D., et. al. College Typewriting. Eighth edition. Cincinnati: South-Western Publishing Company, 1969.

Meehan, James R., and Gilbert Kahn. How to Use Adding Machines--Ten-Key, Full-Key, Printing Calculator. New York: McGraw-Hill Book Company, 1962.

Whitcomb, Helen, and Rosalind Lang. Charm. New York: McGraw-Hill Book Company, 1964.

These textbooks may be placed on a reference shelf for use within the classroom or pockets and cards placed inside the texts so that they can be checked out by students. Answer sheets and miscellaneous forms should be easily accessible to the student. Desk trays placed on a counter are very handy for dispensing these forms quickly and conveniently.

16246

Copies of forms have not been included in order to allow the teacher to select the forms that will best fit into his own situation.

In addition to having copies of the above textbooks for reference, each student will need a copy of the following workbook and practice set:

Connor, Donald W. Filing Practice Workbook. Third edition. New York: Pitman Publishing Corporation, 1969.

Witherow, Mary. The Secretary on the Job. New York: McGraw-Hill Book Company, 1967.

The following free booklets should be obtained from thepost office, telephone company, and the telegraph company: "Zip Code Directory;" "Domestic Postage Rates, Fees, and Information;" "Mountain States Telephone Directory;" "How to Prepare and Use Telegrams."

A point system is used for evaluation. The time allowance given in the course outline was used as a basis in determining the number of points possible for each unit. Fifty points are possible for each time allowance of one week. It was not possible to use this scale on two units. These units are "Transcribing Machines" and "Secretarial Typewriting." A point conversion will have to be made on the transcribing unit only, since the typewriting unit is a section in itself.

Since this is primarily a "doing" course, formal testing has been kept to a minimum. Formal tests are given in three units--"Filing Systems and Procedures," "Using Office Machines--adding machines," and "Using Office Machines--calculators." No sample tests have been included since situations and equipment vary so on these units. It is suggested that alternate tests be available for these units in case more than one student is taking a test on a given day or a test needs to be repeated. NOTE: The first score the student receives on a test is the one that should be used in determining his grade.

Progress reports are optional for this course since credit can be granted on a quarter basis.

16247

COURSE OUTLINE

Secretarial Procedures and Machines

A secretary is supposed to be a "Jill-of-all trades," which includes being a psychologist, politician, diplomat, research expert, memory shark, writer, business lawyer, machinist, personal banker for her boss, errand girl, and desk duster. Furthermore, she is a mind reader, voice culturist, and clothes model. She is calm, polite, dignified, charming, good-natured, and unswervingly loyal to her boss.

Ralph Knight

Texts and Materials

You must have the following materials for your own use at all times:

1. Type paper and typing eraser
2. Pen and pencil
3. Dictionary
4. Folder to keep typing paper and assignments

You will be using a variety of instructional materials in order to provide you with a basic understanding of secretarial procedures and business machines. The following basic textbooks are available for you to use throughout this course:

1. Applied Secretarial Practice, sixth edition
2. Secretarial Office Practice, seventh edition
3. Reference Manual for Stenographers and Typists, fourth edition
4. How to Use Adding Machines
5. College Business Correspondence, second edition, revised

No one text or booklet is sufficient to give you all the information you will need to become proficient in any phase of secretarial work. Each Unit Instruction Sheet will give the titles and page numbers of the texts you will need. The above listed texts are used frequently, but additional texts and supplemental booklets will also be used for specific units.

Course Content

Shorthand, typewriting, and transcription are only three of the many skills and abilities a qualified secretary must have. To succeed in the

secretarial field, you must have the ability to adjust yourself to the numerous requirements of the position. During the course you will complete units pertaining to these requirements.

Goals of the Course

Upon the completion of this course, you should be able to:

1. Complete projects and pass tests pertaining to the various tasks of a secretary, as set up in individual units.

   a. Today's Secretary
   b. Meeting the Public In Person
   c. Meeting the Public by Telephone
   d. Composing Assignments of the Secretary
   e. Filing Systems and Procedures
   f. Telegraph Communications
   g. Using Postal Services and Processing the Mail
   h. Using Office Machines--adding machines
   i. Using Office Machines--calculators
   j. Using Transcribing Machines
   k. Preparing Multiple Copies
   l. On-the-Job Training
   m. Bulletin Boards
   n. Secretarial Typewriting

2. Locate, erase, and correct errors in your secretarial units.

Classroom Procedures

1. Unit Instructions

   a. Complete this course in individual units. On the average you should be able to complete a unit within the suggested time allowance listed below. This time allowance is only a guide and you may find that some of the units will take more time than suggested or you may complete them in less time.

   b. Complete instructional units in the sequence listed for each section. In order to use the equipment available, it is necessary to use a "rotational system." It will be necessary for part of the class to work on Section II while the other half of the class works on Section III. The units have been divided into the following sections:

      (1) Section I

         (a) Today's Secretary (1 week)
         (b) Meeting the Public in Person (1/2 week)

8M10249

(c) Meeting the Public by Telephone (1/2 week)
(d) Composing Assignments of the Secretary (1 1/2 weeks)
(e) Filing Systems and Procedures (2 1/2 weeks)
(f) Using Postal Services and Processing the Mail (1 week)
(g) Telegraph Communications (1 week)

(2) Section II

(a) Using Office Machines--adding machines (4 weeks)
(b) Using Office Machines--calculators (4 weeks)

(3) Section III

(a) Transcribing Machines (3 weeks)
(b) Preparing Multiple Copies (2 weeks)
(c) On-the-Job Training (2 weeks)
(d) Bulletin Boards (1 week)

(4) Section IV

(a) Secretarial Typewriting (8 weeks)

c. Complete one section at a time. Upon the successful completion of a section, one-fourth credit and a letter grade will be given.

2. General Instructions

a. Follow directions well.

b. Accept constructive criticism intelligently and graciously.

c. Proofread accurately.

d. Use all time to good advantage.

e. Give evidence of initiative, dependability, and a deep sense of responsibility.

(1) Attack the job intelligently: Plan the assignment to get the best results
(2) Keep at it until the job is done.
(3) Ask essential questions; avoid asking unnecessary ones.
(4) Feel free to make constructive suggestions.

f. Work co-operatively with the class in the "give and take" of successful team work.

16250

g. Feel free to call on your teacher if you need help, and she will be glad to assist you. Check with your teacher before proceding to the next unit.

h. Replace all texts and materials in their appropriate places before the bell rings.

i. Remain seated until the bell rings. Do not become a clock watcher.

j. Remember that this class is your class, and the benefit you will receive from it will be in direct proportion to the amount of time and energy that you put into it.

16250
16251

She is the front office buffer for the boss against the world . . . She's sympathy with a bottle of aspirin stuck away in the lower left-hand drawer of her desk . . .

She's as efficient as tomorrow . . . and as charming as yesterday.

She lives in a hurried, hurried world. She gets her boss to appointments on time . . . and sees that he has the right tickets for the right plane or the right railroad at the right time . . . She sees that his insurance premiums are paid when due . . . and that the office boy gets a special smile on his birthday . . .

A million details race through her head each day . . . She can bring instant order out of temporary panic . . .

She's a secretary.

If all the secretaries of the world would stop work for a single day, there would be nothing but chaos in the business world. Frantic vice-presidents couldn't find copies of memos, presidents couldn't write letters, sales managers would not prepare sales bulletins. Shipping clerks would scramble for misplaced invoices . . . and there would be nobody to send out at 5 p.m. to buy a box of candy for the forgotten birthday of the bosses' old-maid aunt . . .

She can manage a smile when the boss dictates a shelf of letters 10 minutes before quitting time . . . She can warm an office with a tinkling laugh . . . She can always find things that other people have lost . . .

Her desk drawer contains such items as 52 cents in small change in a tin box . . . Five bobby pins . . . a mirror . . . two combs . . . and a folder advertising a vacation in Hawaii she'll probably never take . . .

She can take shorthand . . . Type a letter . . . Open mail . . . Make decisions . . . Tell little white lies for her boss . . . and still look pretty and efficient when the office clock hits 5 o'clock.

She's America's favorite "Girl Friday" . . . every day of the week . . .

She's a secretary.

Unit Goal

1. You will be able to demonstrate your knowledge of the secretary's place in the business world, of the secretary's personality, and of the secretary's appearance. This will be accomplished by completing the various assignments in this unit.

16253

Texts and Materials

1. Applied Secretarial Practice, fifth edition
2. Applied Secretarial Practice, sixth edition
3. Secretarial Office Practice, seventh edition
4. The Secretary at Work, second edition
5. Charm
6. Rating scales and charts from Applied Secretarial Practice sixth edition

Procedure for Completing Unit

1. Choose a text and read the chapters that deal with personal qualities, appearance, attitudes, career, and general image of a successful secretary. Use the table of contents to locate the information dealing with these topics.
2. Complete the seven projects listed in the assignment section of this unit. Follow closely the directions for each project.
3. Ask for help if there is any assignment that you do not understand. Do not hesitate to obtain assistance from your teacher.
4. Hand in your assignments for evaluation.

Assignments

1. Complete the "Rating Scale for Skills" that is provided so that you may evaluate yourself on the secretarial qualifications you will need. (5 points possible)
2. Using the title "My Secretarial Future," describe the type of position you would like to have upon completion of your preparation for secretarial work. Answers to the following questions might be included in your description:

   a. What type of business do you think you would prefer--for example, a law firm, an insurance company, a store, a railroad office, a government office, or a doctor's office?

   b. Would you prefer to work in a large or a small office? Would you like a position in which you would be meeting many people from the outside, one in which you would work by yourself, or one with only a few people within the organization?

16254

c. Which of the skills listed in the "Rating Scale for Skills" do you think this position might require? (10 points possible)

3. How would you rate yourself in terms of your personality and your general personal effectiveness? Complete the rating form, "How Well Do You Know Yourself". It is often said that more people lose jobs or fail to receive promotions because of personality deficiencies than because of lack of necessary skills. (5 points possible)

4. Briefly answer the following questions:

   a. How can poor health impair an office worker's opportunities of advancement?

   b. Suggest some of the hazards of conveying office gossip?

   c. How does the secretary's punctuality and reliability affect the operation of her employer's office?

   d. What is tact? What part may tact play in the work of the secretary?

   e. What do we mean by the expression "follow'through" when referring to desirable work habits? (10 points possible)

5. Rate yourself on the "Good Grooming Chart." Are you satisfied with your rating? Select three or four points which need improvement and give them your immediate attention. (5 points possible)

6. List in one column four main points about your face and figure that you must consider in selecting attractive clothing. Opposite these points, in the second column, briefly describe the general style of clothing you should choose to emphasize good points and minimize the weaker ones. (5 points possible)

7. Prepare a page illustrating the correct dress and general appearance for a secretary. Choose a basic dress or suit. Illustrate the accessories you might select for office wear; provide for at least three changes suitable for the office. (10 points possible)

18255

UNIT INSTRUCTION SHEET

Meeting the Public in Person

There is no magic formula for greeting visitors, other than courtesy, attentiveness, and tact. Your employer places a great deal of importance on maintaining effective public relations because it develops goodwill for the company. Goodwill is good business. One of the most important duties you will perform as a secretary is that of acting as a receptionist.

A receptionist can make or break all the glamorous effects of an office. Customers are sensitive and sometimes tempermental—the first human touch can persuade them to be reasonable. They need to feel that someone is genuinely interested in their problems. A receptionist must be warm, firm, gracious, concerned, and tactful; she's a shock absorber and a stage setter.

Unit Goals

1. You will be able to schedule and record appointments correctly.
2. You will become acquainted with proper techniques for handling callers.

Texts and Materials

1. Secretarial Office Practice
2. Applied Secretarial Practice, sixth edition
3. Form for mailing appointment
4. "Visitor's Log" report form

Procedure for Completing Unit

1. Read and study pages 245-263 in Secretarial Office Practice.
2. Read and study pages 203-213 in Applied Secretarial Practice.
3. Complete the four assignments listed in the assignment section of this unit. Follow closely the directions for each assignment given in your text or this instruction sheet.
4. Ask for help if there is any assignment that you do not understand. Do not hesitate to obtain assistance from your teacher.
5. Hand in your assignments for evaluation.

18268

Assignments

1. Answer questions 1-5 under "What Do You Think?" on page 255 in Secretarial Office Practice. Type the Question first and then the answer. (5 points possible)

2. Complete Problem 25 on page 257 in Secretarial Office Practice. Follow the direction given in the textbook. Use the attached forms. (5 points possible)

3. Keep a record of callers. In some companies a record is maintained of all callers. This record is sometimes called a "Visitor's Log" Using the attached form, record the arrival and referral of callers on Wednesday, October 8.

   a. 10:10 a.m.: Dave Baker, salesman, Brown Products Company, requested to see Mr. Ballif, Purchasing Department. No appointment. Escorted to Mrs. Grant at 10:13 a.m.

   b. 10:17 a.m.: C. C. Hogge, attorney, to se Mr. Nelson, Vice-president. No appointment. Mr. Nelson out. Make appointment for 2:30 p.m., October 27, through Mr. Nelson's secretary. Departed at 10:20 a.m.

   c. 10:24 a.m.: Miss Linda Randall, job applicant. Filled out application form. Referred to Personnel Department.

   d. 10:43 a.m.: Ed Anderson, designer, to see Mr. Call, Advertising Department, by appointment. Escorted to Mr. Call's office at 10:45 a.m.

   e. 10:59 a.m.: Vern Gardner, Investment Counselor, to see President Selander. No appointment. President not interested. Departed 11:00 a.m. (5 points possible)

4. Complete the project given on page 256 in Secretarial Office Practice under "Secretarial Work." Write what the receptionist and caller might say in each of these situations. (5 points possible)

UNIT INSTRUCTION SHEET

Meeting the Public by Telephone

Of course you know how to use the telephone! Picking up the telephone is almost second nature. You realize the importance of a good social telephone personality, but have you ever thought about how vital the devlopment of a good business telephone personality is in a business career?

Many companies prefer to telephone clients rather than to write them. Here is where a secretary's telephone assets are in demand. Her knowledge of proper telephone techniques and her use of telephone courtesy will pay dividends not only to her employer but to herself.

A secretary is usually expected not only to answer the telephone but to place calls for her employer. She may often need to make local calls to get information or to leave a message. She may place countless calls to persons within the country both for herself and her employer. Sometimes she may also be asked to place long distance calls. To measure up to these expectations, she needs to be expert in various telephone techniques.

Unit Goals

1. You will become acquainted with proper business telephone etiquette and techniques.
2. You will be able to take and record messages accurately and neatly.
3. You will be able to locate frequently used telephone numbers from the alphabetic and classified sections of the telephone book.
4. You will be able to place and record outgoing calls correctly.

Texts and Materials

1. Secretarial Office Practice, seventh edition
2. Mountain States Telephone Directory--Metropolitan Ogden
3. Telephone Message Form
4. Telephone Charges Form

Procedure for Completing Unit

1. Read and study pages 211-229, 233-237, and 239-243 in Secretarial Office Practice.

16258

2. Complete the five assignments listed in the assignment section of this unit. Follow closely the directions for each assignment given in your text or in this instruction sheet.

3. Ask for help if there is any assignment that you do not understand. Do not hesitate to obtain assistance from your teacher.

4. Hand your assignments in for evaluation.

Assignments

1. Answer study questions 1-16 on page 229 in Secretarial Office Practice. (5 points possible)

2. Type on a plain sheet of paper an improved version of these conversations. Give the exact wording you would use. Keep in mind the pointers on telephone etiquette given in the text. (5 points possible)

a. Mrs. Orton: "Bigalow'n Brown."

Mr. Francis: "What?"

Mrs. Orton: "Bigalow and Brown. May I help you?"

Mr. Francis: "Yes. I want to talk to Mr. Jensen."

Mrs. Orton: "What department is he in?"

Mr. Francis: "Shipping, I think"

Mrs. Orton: "Jist a minute." (The line went dead for about 20 seconds.)
"Sir?"

Mr. Francis: "Yes?"

Mrs. Orton: "I'm sorry, Mr. Jensen has left the building."

Mr. Francis: "Do you know when he'll be back?"

Mrs. Orton: "No, I'm sorry."

Mr. Francis: "May I leave a message?"

Mrs. Orton: "Of course."

Mr. Francis: "Tell him to call Val Parrish of History Alley when he gets in."

16259

Mrs. Orton: "Thank you. I'll give him the message."

b. Mrs. Frey: "H'lo."

Mr. Boren: "Is this Bonneville High School?"

Mrs. Frey: "Yeah."

Mr. Boren: "May I please speak with Mr. Selander?"

Mrs. Frey: "He went out to lunch and hasn't come back yet"

Mr. Boren: "Do you know when to expect him?"

Mrs. Frey: "Nope. He should be here now!"

Mr. Boren: "Well . . . I'll try later."

Mrs. Frey: "O. K. Bye-bye." (Hangs up.)

3. Look up in a telephone directory the telephone numbers of the following business and services that your employer will be needing from time to time. Type them on a sheet of paper.

a. Locate the following numbers in the alphabetic section of the telephone book:

1. Western Union
2. Police department - Washington Terrace
3. Post office - Washington Terrace branch
4. Main local office of the state employment service
5. County Department of Public Welfare
6. The area codes of Chicago, Los Angeles, Philadelphia, San Francisco, Dallas, and Boston

b. Locate the following number in the Yellow Pages or classified section:

1. An agent for calculating machines
2. A certified public accountant
3. A tax return specialist
4. A lawyer
5. A florist in Clearfield

c. Arrange these telephone numbers in alphabetic order and type them on a 5½ by 8 1/8 inch sheet of paper to be fastened to the cover of your employer's telephone directory:

1. A physician
2. A travel bureau
3. Typewriter dealers (Remington and IBM)

16260

4. Office supply stores (Weber Office and Ogden Desk)
5. Fire Department
6. Airport
7. Telephone information
8. A local bank
9. Weber County Library
10. Business Office of the telephone company
(10 points possible)

4. Fill out a brief memorandum for each of the following incoming telephone calls which were received while your employer, Mr. Anderson, was out of the office. Record on forms provided.

a. Mr. Selander, of the Cleveland office, called long distance at 4:10 p.m. to tell you that the Bonneville Supply House order is to be cancelled.

b. William R. Boren of Chicago called at 10:30 a.m. in regard to an order. Mr. Boren's telephone number is 312 555-3456. He will call again at 2 p.m.

c. Mrs. J. F. Anderson called Mr. Anderson (her husband) at 12:30.

d. Mr. Lamont Heslop of Philadelphia called at 11:35. He said that he had received order No. 10256 but had not received order No. 10245, which had been placed a week before the other order. His telephone number is 215 555-8230. (5 points possible)

5. Assume that your employer, Mr. J. F. Anderson, wishes to make the following out-of-town calls from the office telephone, 399-1113, on the current date. In order that the monthly toll statement received from the telephone company may be audited (checked for correctness) and the charges allocated to the proper offices or persons, the secretary keeps a record of each toll call when it is made. Record on the forms provided the toll calls made. All calls other than personal ones are charged to General Administrative Expense (GAE). The cost is given after each call. (5 points possible)

a. A person-to-person call to Scott W. Ballif, of Fort Worth, Texas, relative to a personal matter. You do not know his number or address, but he is a noted eye specialist. $2.65.

b. A call to Mr. Harry Burchell of the Brown Construction Company; Walnut Street; Baltimore, Maryland; regarding a back order for parts. $4.25.

c. A station-to-station call to Mr. Anderson's mother, who

16261

Mrs. Orton: "Thank you. I'll give him the message."

b. Mrs. Frey: "H'lo."

Mr. Boren: "Is this Bonneville High School?"

Mrs. Frey: "Yeah."

Mr. Boren: "May I please speak with Mr. Selander?"

Mrs. Frey: "He went out to lunch and hasn't come back yet"

Mr. Boren: "Do you know when to expect him?"

Mrs. Frey: "Nope. He should be here now!"

Mr. Boren: "Well . . . I'll try later."

Mrs. Frey: "O. K. Bye-bye." (Hangs up.)

3. Look up in a telephone directory the telephone numbers of the following business and services that your employer will be needing from time to time. Type them on a sheet of paper.

a. Locate the following numbers in the alphabetic section of the telephone book:

1. Western Union
2. Police department - Washington Terrace
3. Post office - Washington Terrace branch
4. Main local office of the state employment service
5. County Department of Public Welfare

b. A call to Mr. Harry Burchell of the Brown Construction Company; Walnut Street; Baltimore, Maryland; regarding a back order for parts. $4.25.

c. A station-to-station call to Mr. Anderson's mother, who

263

lives in Grand Rapids, Michigan. Her number is 616 281-6912. $1.15

d. A call to Mr. Dennis Hogge, of the Attendance Supply Company, in Freyville. The call is to check the reference of Reid Hansen, an applicant. $3.75

e. A call to Allen Products Company, on Twelfth Avenue, in Allentown, about the cancellation of our order. The number is 237-6123. The charges are to be reversed.

16264

UNIT INSTRUCTION SHEET

Composing Assignments of the Secretary

The extent to which a secretary helps an employer compose communications depends on her ability and the confidence her employer has in it. Employers value secretaries who are willing and able to assume responsibility for routine correspondence such as giving routine information, asking for something, transmitting material, making or changing appointments, or acknowledging receipt of something. Many employers need a secretary who knows how to take hastily dictated notes and expand them so that they sound right and are carefully punctuated and edited.

Letter writing is a complex office activity that defiles efforts to reduce it to a simple set of rules or a formula. But is is possible to isolate two qualities characteristic of all good letters. Letters should be clearly written and communicate information in such a way that they create a favorable response from the reader.

Goethe wrote, "Remember that: Write only as you would speak; then your letters will be good."

A LETTER TALKS TO ITS WRITER

Before you sign me, let me say
That I don't feel so good today;
I'm not prepared to meet a buyer!
I seem to lack the kind of fire
That drives home what you would convey.

My head (I mean my letterhead)
Is uninspiring, flat and dead;
It doesn't catch the reader's eye.
Remember, sir, that I must vie
With other letters to be read.

The way I talk is insincere;
My meaning is not crystal clear;
I'm cluttered up with phrases trite--
The kind of stuff they used to write
Way back there in a distant year.

Forget the "I" and make it "You"
And get the reader's point of view;
Rewrite, delete, correct, revamp
So that my six-cent postage stamp
Presents a story fresh and new.

By Orville E. Reed

ddd016265

Unit Goals

1. You will become acquainted with basic letter-writing techniques. It is important for you to understand the essentials of a clear, effective letter.

2. You will be able to compose letters that are most frequently written by secretaries in a concise and complete fashion using basic letterwriting techniques.

Texts and Materials Needed

1. College Business Correspondence, second edition, revised

2. Applied Secretarial Practice, sixth edition

3. Typing Paper and eraser

Procedure for Completing Unit

1. Read and study the pages given in each assignment.

2. Complete the eight projects listed in the assignment section of this unit.

3. Follow closely the directions given for each assignment when completing a basic letter-writing technique project. Do not write or complete any project in the textbook itself.

4. Read the letter you are to answer in its entirety before you begin composing a letter. Decide what the answers to the questions will be and what information should be given before you begin to write. Make brief notes of what you want to say and the points you want to cover.

5. Ask for help if there is any assignment that you cannot understand. Do not hesitate to obtain assistance from your teacher.

6. Hand in your assignments for evaluation.

Assignments

1. Read and study pages 9-12 in College Business Correspondence. Proofread the letter on page 23. Type the letter in double spaced form, cross out all incorrect words, and write the correct words above. This letter contains twenty-five errors. (5 points possible)

ED016266

2. Read and study pages 25-29 and 37-44 in College Business Correspondence. Certain phrases and long words make a sentence too bulky. Type the sentences on page 47 first as they are, and then type the correct sentence below it. This exercise will test your skill in selecting a short, concise word to replace a long word or phrase. (5 points possible)

3. Read pages 49-51 in College Business Correspondence. Courtesy and character are important in beginning and ending a letter. Rewrite sentences 5, 19, 15, 20, 25, 30, 35, and 40 on pages 52-54. Type the sentence as it is first, and then the revised one below it. Make the sentences as concise and clear as possible. (5 points possible)

4. Read pages 11-117 in College Business Correspondence. An order is the first link in the business chain. Write order letters for Problems 2 and 7 on pages 118 and 119. Refer to page 112 for an illustration of an order letter. Avoid including unnecessary details in your letters. (15 points possible.)

5. Read pages 125-129 in College Business Correspondence. One of the best ways in which any business can build and maintain good will is to acknowledge each order promptly. Write letters of acknowlegement for Problem 2 and 5 on pages 129 and 130. Pages 126 and 127 have several good examples of the different types of acknowledgement letters. (15 points possible)

6. Read pages 133-138 in College Business Correspondence. A business can build good public relations by saying "thank you" for remittances it receives from customers. Write a thank you letter for Problem 3 on page 139. Be sure to make the letter cordial in tone. (10 points possible)

7. Read pages 141-143 in College Business Correspondence and write a reply to the inquiry letter in Problem 7 on page 144. Remember to give the exact information requested. (10 points possible)

8. Refer to page 101 in Applied Secretarial Practice for an example of a letter written by a secretary when her boss was out of town. Mr. William A. Jones decides to leave on a trip that will keep him away for several days. Therefore, all appointments for that time must be canceled. Local appointments are canceled by telephone, but those with persons out of town are canceled by mail or wire. Write a letter to Mr. Thomas, who has an appointment with Mr. Jones on Friday afternoon, June 9, at 3 9'clock. This letter must be definite in referring to the time and place of the original appointment. Like all business letters, it must be written from the reader's point of view, expressing regret for inconvenience caused and extending the courtesy of another time for the appointment. This letter should be signed with your name as secretary to Mr. Jones.

16267

UNIT INSTRUCTION SHEET

Filing Systems and Procedures

Filing and finding business papers is an important responsibility for all secretaries. Due to the tremendous volume of business correspondence, it is imperative that accurate and up-to-date files be kept. The records in the files are so vaulable that they are sometimes referred to as the "memory" of the business.

We can say that filing is the process of classifying and arranging records so that they will be kept safely and will be obtainable quickly when needed. Filing is not merely the storing of records to get them out of sight, but a systematic organization of those records so that they can be located quickly.

I don't have to say that my grandmother died
If I want to turn out for the Dodgers,
My boss won't grumble, my boss won't chide,
I've got it down to a science!
I don't have to faint, or resort ot tears,
Or use any feminine wiles--
They can't fire me--for the last two years
I've been keeping the office files.

Yes, I have a system that's all my own,
And it can't be explained, and it can't be shown.
I file by number, I file by letter,
I file by ways that are the times better,
I file by subject, I file by date,
I file by city, I file by state.
I shun the trite, and I scorn conventions,
My filing system has four dimensions.

I regard "In re" at the top of a letter
As something to make it balance better.
I pay no attention to underlining
And seldom get to the persons signing.
I've got the names of the firm's officials
Neatly arranged by their middle initials.
Customers' letters I've filed instead
By the color and size of their letterhead.

I've got the catalog mailing list
Filed under "Farley"--you get the gist.
Our financial reports, for my own good reasons,
Instead of by months, I've arranged by seasons.
I've put Mrs. Duffy's damage suit
In a folder entitled "Big Dispute."
And for anything I consider extraneous,
I've three whole drawers labeled "Miscellaneous."

16268

To The Beginning Drafting Student:

Before jet engines, automobiles, rockets, electrical appliances, and buildings can be constructed, a drawing of each part must be made. A person who can read and make good drawings is a more valuable employee in many lines of work. Drafting is most important to anyone who expects to work in the manufacturing, construction trades, or who wishes to become a professional engineer. Our mass production methods of manufacture would not be possible without the drawings made by draftsmen.

Drafting can be a very important subject for you. The course can help you develop skills that will be useful in everyday life as well as in industry. Drafting will teach you a way of explaining and showing by use of pictures instead of words or the real thing. You will actually be learning a new language—the language of industry. This language can be understood anywhere in the world.

This course will give you an opportunity to explore several areas of drafting. You will have an opportunity to read and make drawings that will be helpful to you. If you plan to become a scientist, engineer, or go into industrial work, you should plan to take more drafting. Each year in high school you will be given an opportunity to elect advanced courses in drafting which will help you become more skillful in reading and making drawings. You will have a chance to develop more skill in the use of the tools used by draftsmen and to specialize in one area of drafting such as Mechanical or Architectural.

CRDI
1624

I'm the indispensable employee,
They can't take a step without me;
And it cost them a raise and half-day free
Every time they attempt to flout me.
So they can't fire me, no matter how cross,
No matter how mean and riling!
I'm Monroe herself--I'm the boss's boss,
For I take care of the filing.

--Successful Suzy

Unit Goals

1. You will be able to apply the basic alphabetic rules of filing.

2. You will be able to pass a test involving indexing, coding, and filing of names of individuals and a test involving indexing, coding, and filing of names of businesses. At least 84% accuracy will be required to pass each test.

3. You will be able to apply the basic geographic rules of filing.

4. You will be able to pass a test involving indexing, coding, and filing of names of individuals and businesses geographically. At least 84% accuracy will be required to pass the test.

5. You will become familiar with the advantages and disadvantages of alphabetic, geographic, subject, and numeric filing; the general rules and suggestions for filing; and clues for finding papers that have been misfiled.

Texts and Materials Needed

1. Filing Practice Workbook, third edition

2. Applied Secretarial Practice, sixth edition

3. Shorthand notebook

4. Rubber bands

Procedure for Completing Unit

1. Obtain a copy of Filing Practice Workbook from your teacher. Staple the pocket on the back cover so you will have a space to keep your filing slips.

2. Read carefully the introductory material on the inside covers of your workbook.

16269

3. Rules and examples are given at the top of each job in the workbook. Be sure to study these rules and examples before starting to do the job.

4. Tear out filing slips as you reach a specific job. Whe you separate the slips, keep them together by placing a rubber band around the slips for each job.

5. Save the filing slips after you tear them apart. You will need them for later jobs.

6. Remember the following four steps in filing:

   a. Indexing--determine what to put it under

   b. Coding--underline the primary index unit

   c. Sorting--arranging in preliminary order

   d. Filing--place in a file container

7. Code the primary index unit of each filing slip. For example: In Job 1 you would underline the surname, Washington.

8. Use the code number contained on each slip. Code number 3--8 means that is is filing slip No. 8 in Job 3. This code number is important in reporting your answers.

9. Use a shorthand notebook (one that is not used in your shorthand class) to record each filing job. Write your name at the top of each page and indicate the job number. You may use both sides of the paper.

10. Arrange all the slips in a job in correct filing order and report your arrangment through the use of the code numbers. For example: Number your paper from 1 to 18. Start with your first slip to be filed and record its code number next to the No. 1 on your paper.

11. Check each job with the key when you have completed it. Write the number of errors at the top of the answer sheet. If you do not understand the order of some of the filing slips as recorded in the key, be sure to check with your teacher. Do not proceed to the next job until you are sure you understand the rule covered in the job you have just completed.

12. Complete Assignment 1 and turn in the answer sheets for these jobs.

13. Take the test for the filing of names of individuals. (50 points possible)

16271 16270

14. Complete Assignments 2 and 3 and turn in the answer sheets for these jobs.

15. Take the test for the filing of names of businesses. (50 points possible)

16. Read and study pages 401 - 412 in Secretarial Office Practice, sixth edition.

17. Complete Assignment 4.

18. Read carefully the introductory material on the inside back cover of Filing Practice Workbook dealing with geographic filing. Complete Assignment and turn in the answer sheets for these jobs. (Assignment 5)

19. Take the test for the filing of names of individuals and businesses geographically. (25 points possible)

20. Read and study pages 429-453 in Secretarial Office Practice, sixth edition.

21. Complete Assignment 6.

22. Hand in Assignments 4 and 6 for evaluation.

Assignments:

1. Complete Jobs 1 through 12. Also, complete the following Optional Jobs: 8C, 8D, 12C, and 12D. All other Optional Jobs should be omitted.

2. Complete Jobs 13 through 23 and 25 through 26. Also, complete the following Optional Jobs: 20C, 20D, and 24C. Job 24 and all other Optional Jobs should be omitted.

3. Jobs 27 through 32 may be completed for review.

4. Answer questions 13-17 on page 413 in Applied Secretarial Practice, sixth edition.

5. Complete Optional Filing Jobs 27A-32A, 32E, and 32I in Filing Practice Workbook.

6. Complete Bonus Project 6 on page 457 in Applied Secretarial Practice. Make a carbon copy of this assignment. The carbon copy should be turned in and the original copy kept for future reference.

16271

UNIT INSTRUCTION SHEET

Telegraph Communications

Many times urgent business messages that must be sent to distant points can be reduced to a very few words. In such cases, it would be wasteful to pay for a minimum of three minutes of long distance telephone time to ask a question of 5 or 6 words. On the other hand, asking the question even by the fastest mail may be too slow.

Fortunately for the businessmen, commercial telegraph service is a solution to the problem of getting immediate attention or responding without delay. Brief messages can be sent economically and quickly to any part of the country.

After you are employed as a secretary, you will be expected to know when to send telegrams and which type of service to use. You will also be expected to know how to compose telegrams and how to get your message to the telegraph office.

Unit Goal

1. You will be able to compose a telegram, determine the number of chargeable words in a telegram, and type a telegram in acceptable form.

Texts and Materials Needed

1. Secretarial Office Practice
2. Reference Manual for Stenographers and Typists, fourth edition
3. College Typewriting, eighth edition
4. Booklet entitled "How to Prepare and Use Telegrams"
5. Telegram blanks

Procedure for Completing Unit

1. Read and study pages 197-207 in Secretarial Office Practice. Up-dated information can be found in the booklet entitled, "How to Prepare and Use Telegrams."
2. Complete the five assignments listed in the assignment section of this unit. Follow closely the directions for each assignment given in your text or this instruction sheet.

16272

3. Ask for help if there is any assignment that you do not understand. Do not hesitate to obtain assistance from your teacher.

4. Hand in your work for evaulation.

Assignments

1. Determine the number of chargeable words for each of the following telegrams. Type these telegrams on a plain sheet of paper. If a word or group of letters, figures, or characters represents more than one chargeable word, underscore the item and indicate by a small figure beneath the underscore the number of chargeable words included. Omit spaces where permitted if it will result in savings in word counts. Place the number of chargeable words in parentheses at the end of the telegram. Refer to the section entitled "Counting the Chargeable Words" on pages 199-201 in Secretarial Office Practice in completing this assignment. (8 points possible)

   a. CHANGE CATALOG GROSS PRICES ON AS123 TO $117.92; 10B10 to $192.21; 15X102128 TO $85.72.

   b. STOCK EXHAUSTED ON KNRP, KNRPVO, AND VT.

   c. ENJOYED SEEING LOCKS AT SAULTE STE MARIE. HEADING FOR CANADA TODAY. RETURNING TO UNITED STATES 10 P.M. WEDNESDAY. FEELING OK.

   d. CHANGE 1-½ to 7-½ IN 17th LINE ON PAGE 21 IN PLUMBING SPECIFICATIONS.

2. Complete Problem 1-6 on page 208 in Secretarial Office Practice. Determine what type of service should be used in each situation. Remember that only two types of services are now available. (12 points possible)

3. Type a file copy of the following telegrams. Refer to page 170 in College Typewriting for an example of how to type a file copy of a telegram. It is not necessary to include a zip code since the zip code is not transmitted by the telegraph company at the present time. Type your name and telegram number in the upper left corner of each telegram. Count the number of chargeable words in each telegram. Type this number in the upper right corner of each telegram. (8 points possible)

   a. Overnight telegram from Skidmore, Jones, and Walsh; Ogden, Utah; current date to Henry Samson; 18 Mill Street;

16273

Rockaway, New Jersey. Advising that beginning the first of next month all prices will be increased from 10 to 25 percent on all items due to shortages of materials and increased labor cost. Suggest that you estimate your needs and order immediately to take advantage of present prices. Skidmore, Jones, and Walsh.

b. Telegram from Skidmore, Jones, and Walsh; Ogden, Utah; current date to William Martin; 110 Morningside Drive; New York, New York. Please rush all architectural drawings for Imperial House. Must have by the fifteenth. Skidmore, Jones and Walsh.

c. Telegram from Skidmore, Jones, and Walsh; Ogden, Utah; current date to Hartwell Supply Company; 624 West Jackson Avenue; Chicago, Illinois. Please cancel our Purchase Order #10832 mailed you yesterday. New Order will follow. Skidmore, Jones, and Walsh.

d. Telegram from Skidmore, Jones, and Walsh; Ogden, Utah; current date to Farris Mechanical Engineering Company, 5702 West Union Street; Evansville, Indiana. Final hearings on bids for Westside Shopping Center will be held in our Executive Board Room on November 13, 19--. All bids must be received at least 15 days prior to hearing date. Please get your bids to me as soon as possible. Skidmore, Jones, and Walsh.

4. Rewrite each of the following telegraph messages, using not more than 15 words so that the message may be sent as a fast telegram. Type the old message first and then your revised message on a sheet of paper. (10 points possible)

a. THERE WILL BE A SALES MEETING SATURDAY MORNING IN THE OFFICE AT TEN O'CLOCK. PLEASE ARRANGE TO BE THERE. BRING REQUESTED ESTIMATES.

b. MR. WILCOX WIRED SAYING HE WOULD BE HERE TOMORROW. IS IT POSSIBLE FOR YOU TO COME BACK? MUST KNOW BY THREE O'CLOCK.

c. IN ANSWER YOUR TELEGRAM SUGGEST YOU OFFER A 40% DISCOUNT TERMS 2% 10 DAYS. DELIVERY TO BE MADE FOR NEW YORK.

d. I AM GOING TO DETROIT TOMORROW TO INTERVIEW HARRISON. DO YOU WANT ME TO TELEPHONE SMITH, TOO, WHILE I AM THERE?

e. MODEL DR-3, CALLED FOR ON YOUR ORDER NO. 9952, HAS BEEN DISCONTINUED. MAY WE SHIP MODEL XE-4 INSTEAD OF THAT ORDER?

16274

5. Complete Problems 1-3 on page 209 in Secretarial Office Practice under the heading "Secretarial Work." Compose message for these situations and then type your messages on telegram blanks which are available. Refer to page 226 of the Reference Manual for Stenographers and Typists for an example of how to type a telegram on the new telegraph blanks. This blank varies slightly from the illustrations in the Secretarial Office Practice text.
(12 points possible)

UNIT INSTRUCTION SHEET

Using Postal Services and Processing the Mail

Your mail is important. It represents you when you can't be there in person. Mail handling deserves your careful consideration. Out-dated mailing methods can be costly and time-consuming without your ever realizing it.

To serve your employer well, you must be familiar not only with the simple routine of mailing and distributing letters and packages but also with the numerous services of the Post Office Department. You must also know where to find current, accurate information regarding these services and procedures.

Unit Goal

1. You will be able to classify mail, use a register of expected mail, address an envelope correctly, figure the cost of postage, and type file cards for a mailing list.

Text and Materials

1. Secretarial Office Practice
2. Booklet entitled "Domestic Postage Rates, Fees, and Information"
3. Form for Mail Expected Under Separate Cover
4. 3 X 5 Index cards

Procedure for Completing Unit

1. Read and study pages 171-193 in Secretarial Office Practice.
2. Complete the five projects listed in the assignment section of this unit. Follow closely the directions for each project given in your text. Due to changes in the postal system, updated information has been included in the assignment section. Illustrations for filling out postal forms are found in the text.
3. Ask for help if there is any assignment that you do not understand. Do not hesitate to obtain assistance from your teacher.
4. Hand your work in for evaluation after completing the five projects in this unit.

16276

Assignments

1. Determine what class of mail applies to each of the following items:

   a. Package (4 pounds)
   b. Look Magazine
   c. Postal card
   d. Blue Spruce Tree (small)
   e. Circular
   f. Birthday card
   g. Carton (75 pounds)
   h. Business Reply Card
   i. Sample box of Dash soap
   j. Typed letter
   k. January White Sale Advertisement
   l. Longhand report
   m. Inter-office memorandum
   n. Merchandise sample (4 ounces)
   o. Air Card
   p. Double post card
   q. Catalog (350 pages)
   r. Newspaper
   s. Baby Chickens
   t. Flower Seeds

2. Complete Problem 20 on page 178 in Secretarial Office Practice. Record on the form provided and refer to page 176 for illustration. (5 points possible)

3. Complete Problem 4 on page 194 in Secretarial Office Practice. Type the addresses in correct form on slips of paper 3 5/8" by 9 1/2". With the advent of zip code, the following changes have been made in the typing of addresses:

   a. Single space the address lines, no matter how many lines there are. An address should never be typed on less than three lines. If necessary, place the zip code on a separate line.

   b. Block the address lines. Do not arrange them in indented form.

   c. Avoid abbreviations. In street addresses, never abbreviate North, South, East, and West; likewise, never abbreviate Street, Avenue, Boulevard, Drive, etc.

   d. Use the new two-letter abbreviations for state names. Space three spaces between the two-letter state abbreviation and the zip code.

   e. Use a personal courtesy title (Mr.,Miss, Mrs., Etc.) preceding the name when the letter is addressed to an individual. (10 points possible)

4. Complete Problem 5 on page 195 in Secretarial Office Practice. Refer to the booklet entitled "Domestic Postage Rates, Fees, and Information" for current postal rates. Figure each item and list it separately. Obtain a grand total for all the items. Remember that a fee for special postal services must be paid in addition to the regular postage rate. (15 points possible)

5. Complete Problem 6 on page 195 in Secretarial Office Practice. Obtain 16 index cards from your teacher for this project. Refer to page 190 for an illustration on how to type these cards. Use the second example. Begin typing on the third line from the top edge and set a one-half inch left margin. Triple space after typing the first line and use a two-letter state abbreviation for the name of the state. (15 points possible)

UNIT I — FREEHAND SKETCHING

General Information

Freehand Sketching:

Have you ever made a sketch to explain something? This is making a freehand drawing. The advantages of freehand drawings are that they are quicker and more convenient to make since the only tools required are a pencil and an eraser. Skill in freehand sketching is useful for everyone. It is a necessity for those engaged in industrial or technical work. This skill can be acquired by anyone if he will follow certain simple procedures and practice consistently.

The T-square and the triangles are the straight-edged tools used to make a finished working drawing. However, drawings of several views of an object which show clearly the size and shape of all of its parts can be made entirely without the use of instruments. The general principles involved are the same as in mechanical drafting.

The technique of sketching consists in knowing what pencil is best suited to the paper being used, keeping the pencil sharp, holding it correctly, and following a few well-founded procedures:

1. Sketch horizontal lines from left to right as in Figures 2 and 3, which are illustrated on page 9. The stroke is either a wrist or forearm movement and should be only as long as can be conveniently made. The hand should then be shifted to the right for the next stroke.
2. In drawing any straight line between points, keep the eye on

UNIT INSTRUCTION SHEET

Usin. Office Machines--adding machines

Two major classifications of computing machines according to use are: adding and calculating. During this unit, you will be using adding machines. Now days when the term "adding machine" is used, it means the ten-key adding machine. This machine is probably the simplest and most common type to be found in the office. The skills you will learn on this machine are basic and will carry over when using other machines.

The ten-key adding machine is so named because its basic keyboard contains only ten number keys (1, 2, 3, 4, 5, 6, 7, 8, 9, and 0). The keyboard is designed for a touch system of fingering. In other words, you do not have to watch the keyboard but can concentrate completely on the copy. This concentration results in accurate recording and higher speed. This machine is designed primarily to solve problems in addition and subtraction, but multiplication and even division can also be done. You must develop a good skill in addition since this is the most important function of the machine.

Even though ten-key adding machines are made by several manufacturers; if you know the basic operating principles of one model, you can easily become familiar with the operating features of other models.

Unit Goals

1. You will be able to perform all of the basic mathematical functions associated with the operation of a ten-key adding machine using the touch method of operation.

2. You will be able to add 39 problems consisting of from three to six digits in 15 minutes with a score of 70% or more.

3. You will be able to complete two 50 problem tests covering basic mathematical functions and covering practical applications on the ten-key adding machine with a score of 70% or more.

Text and Materials

1. How to Use Adding Machines
2. Business Arithmetic Pretest
3. Answer Sheets--Ten-Key Adding Machine--Lesson 1-6.
4. Answer Sheets--Ten-Key Adding Machine--Lessons 7-10

16280

16279

Procedure for Completing Unit

1. Pick up a loose-leaf text for the ten-key adding machine each day as you enter the room. Do not remove pages from this text. This text must be replaced at the end of the period.

2. Obtain the Answer Sheets for Lesson 1-6. Answer sheets are available in the shelf trays on the counter. The Answer Sheets will give the page number and the number of problems to complete for each lesson.

3. Use the connecting door to move from the classroom to the machine's lab.

4. Clear the adding machine's table of all books and papers that do not pertain to the course. Place the machine to the right of the table and the textbook to the left. Position the machine and text to give you ease of operation and reading.

5. Sit erect, relax, and put both feet flat on the floor.

6. Clear the machine by depressing the total key. Always be sure your machine is clear before starting to work a problem. Also, never force a key on a machine. If keys won't work, get help from your teacher.

7. Correct your answers with the Key after you have completed a lesson. The Key is available in a loose-leaf. Rework any problems that are incorrect. Hand in each lesson with the adding machine tape to this lesson stapled on to the back of the Answer Sheet.

8. Complete the first six lessons and correct your Answer Sheets. When you have completed these lessons, you should be prepared to take the speed test and the test on basic mathematical functions. The adding machine tapes to these tests must be stapled on to the back of each test.

9. Obtain the Answer Sheets for Lessons 7-10.

10. Complete Lessons 7-10 and correct your Answer Sheets. When you have completed these lessons, you should be ready to take the test on practical applications. The adding machine tape to this test must be stapled on to the back of the test.

Assignments

1. Complete the Business Arithmetic Pretest and correct your answers with the key. This pretest will help to pinpoint any weaknesses in arithmetic you may have.

2. Complete the Answer Sheets for Lessons 1-6.

3. Complete the Answer Sheets for Lessons 7-10

UNIT INSTRUCTION SHEET

Using Office Machines--calculators

Two major classifications of computing machines according to use are: adding and calculating. During this unit, you will be using calculating machines. These machines are designed primarily for multiplication and division, but they may also be used for addition and subtraction.

In the modern office, machines known as printing calculators and electronic calculators have replaced key-driven and rotary calculators. The keyboard of the printing calculator and the electronic calculator resemble that of the ten-key adding machine. Special keys have been added to provide for automatic processes. The printing calculator is rapidly becoming the popular all-round workhorse in any office where a tape listing of figures is desired. On the other hand, the electronic calculator is relatively new. This machine operates silently at virtually the speed of light to supply the answer in a few mili-seconds or less.

Even though calculating machines are made by several manufacturers; if you know the basic operating principles of one model, you can easily become familiar with the operating features of other models.

Unit Goals

1. You will be able to perform all of the basic mathematical functions associated with the operation of a printing calculator and an electronic calculator using the touch method of operation.

2. You will be able to complete a 50 problem test covering basic mathematical functions on the printing calculator with a score of 70 percent or more.

3. You will be able to complete a 50 problem test covering basic mathematical functions on the electronic calculator with a score of 70 percent or more.

Texts and Materials

1. How to Use Adding Machines

2. Text for the Electronic Calculator

3. Answer Sheets--Printing Calculator--Lessons 1-7

4. Answer Sheets--Electronic Calculator--Lessons 1-4

162841

Procedure for Completing Unit

1. Pick up a loose-leaf text for the printing calculator each day as you enter the room. Do not remove pages from this text. This text must be replaced at the end of the period.

2. Obtain the Answer Sheets for the printing calculator for lessons 1-7. Answer Sheets are available in the shelf trays on the counter. The Answer Sheets will give the page number and the number of problems to complete for each lesson.

3. Use the connecting door to move from the classroom to the machine's lab.

4. Clear the machine's table of all books and papers that do not pertain to the course. Place the machine to the right of the table and the textbook to the left. Position the machine and the text to give you ease of operation and reading.

5. Sit erect, relax, and put both feet flat on the floor.

6. Clear the machine by depressing the total key. Always be sure your machine is clear before starting to work a problem. Also, never force a key on a machine. If keys won't work, get help from your teacher.

7. Correct your answers with the Key after you have completed a lesson. The Key is available in a loose-leaf. Rework any problems that are incorrect. Hand in each lesson with the adding machine tape to this lesson stapled on to the back of the test.

8. Complete Lessons 1-7 and correct your Answer Sheets. When you have completed these lessons, you should be prepared to take the test on basic mathematical functions. The adding machine tape to this test must be stapled on to the back of the test.

9. Pick up the loose-leaf text for the electronic calculator. Do not remove pages from this text.

10. Obtain the Answer Sheets for the electronic calculator for Lessons 1-4.

11. Complete Lessons 1-4 and correct your Answer Sheets. When you have completed these lessons, you should be ready to take the test on basic mathematical functions.

Assignments

1. Complete the Answer Sheets for the printing calculator for Lessons 1-7.

2. Complete the Answer Sheets for the Electronic Calculator for Lessons 1-4.

16885

UNIT INSTRUCTION SHEET

Using Transcribing Machines

Even though you will probably be employed as a shorthand writer and transcriber, you may from time to time be asked to transcribe dictation that has been recorded on a machine. Some executives use dictation machines to handle after-hours dictations; some use portable machines to record letters and reports while they are away from the office on business trips; still others prefer to handle most, if not all, of their dictation in this manner. It is important, therefore, that you be acquainted with the operating principles of dictating and transcribing machine and that you follow efficient procedures in using them.

Unit Goal

1. You will be able to operate a transcribing machine efficiently by setting up dictated letters and manuscripts in mailable form.

Texts and Materials Needed

1. IBM Transcription Techniques
2. ZIP Code Directory
3. Electric typewriter
4. Transcribing machine
5. Pre-recorded transcription belts.

Procedure for completing Unit

1. Read the out-of-class preparation for Lessons 1, 2, and 3 in IBM Transcription Techniques.
2. Obtain transcribing equipment and transcription belts.
3. Set up equipment at a desk next to an electrical outlet.
4. Adjust the controls of the machine to suit your particular needs; the speed control, until the voice is clear (neither too fast nor too slow); the volume control, to suit your own listening preference; and the tone control, for pleasant listening.

10286

5. Use the index tab which accompanies each recording as a guide to letter placement and as a key to corrections in the dictation. Remember that a correction will appear on the lower half of the index tab. Listen to the corrections and special instructions before you begin to type from the recording.

6. Start transcribing slowly: Start the machine; listen to a few words at a time; stop the machine; transcribe those words; start the machine again and repeat the process.

7. Use the repeat control on the machine which permits you to repeat the last few words of the dictation. Try to develop the power to carry dicatation in your mind for more continuous transcription.

8. Label all letters and manuscripts according to the belt number. Type your name and belt number in the upper left corner of each sheet of paper. Each exercise on a belt must be placed on a separate page.

9. Proofread each transcribed item at least twice.

10. Remove the belt and index tab from the machine and place it in the proper container at the end of each period.

11. Complete the transcription of a belt, staple all papers together in the upper left corner, and correct your work with the Key for this unit. Each page of transcription must be typed in "mailable" form. Each page will be worth five points, one point deducted for each error. A minimum of three points per page is required.

Assignments

1. Answer the following questions from your reading:
   a. What is the foot control used for?
   b. What is the index tab used for?
   c. How should the belt be inserted into the machine?
   d. When you hear double voices on the machine, what should you do?

2. Use belts 3 and 4 for practice. Type them in rough-draft form in order to get the "feel" of the machine.

16287

the points to which the line is to go rather than on the pencil. Do not try to draw the entire length of the line in a single stroke. It may be an aid to draw a very light line at first, then to sketch the finished line, correcting the direction of the line without rubbing it out. Do not be disturbed by any nervous waviness. Accuracy of direction is more important than straightness of line.

3. Vertical lines and inclined lines sloping downward from right to left are drawn easily with a finger movement in a series of short easy strokes with the hand holding the pencil in the position of Figure 4, Illustration Sheet 1, page 9.
Vertical lines and inclined lines, sloping down from left to right, may be drawn by turning the paper and drawing them as horizontal lines.

Freehand sketching has the following uses:

1. It is a rapid method of developing ideas, inventions, and designs.
2. It is the best way to plan the layout of a mechanical drawing.
3. It is used as a quick means of communicating ideas from designer to draftsman.
4. It is the best means of recording information which must be obtained outside the drafting room.
5. It is an aid in conveying ideas and mechanical information from foreman to workman, salesman to buyer, or from teacher to pupil.

You should be ready to complete Work Sheets numbers 1, 2, 3, and 4. Turn to page 15.

3. Transcribe in mailable form all exercises contained on belts 5, 7, 8, and 10. Omit the dictated words at the beginning of belts 5 and 10. The material on all belts should be typed directly as final "mailable" copy without using a rough draft. Keep the following points in mind when transcribing:

   a. Paragraphs should be set up in unbound manuscript form.

   b. Manuscripts should be typed in bound manuscript form.

   c. Letters should be typed in modified block style. Use two-letter state abbrevations and obtain the correct zip code from the ZIP Code Directory. Carbon copies are not required, but make a carbon copy notation on the original if a carbon copy is requested on the transcription belt.

UNIT INSTRUCTION SHEET

Preparing Multiple Copies

Practically nothing in an office is "a single copy." Modern business activity requires an almost incredible number of extra copies of papers--letters, memos, reports, brochures, bulletins, notices, manuals, names and addresses, and so forth. Business thrives on multiple copies, sometimes thousands, to inform everyone who should be informed. Many different kinds of processes are on the market to produce these extra copies. There is still no one process that will handle all the various copy-making requirement of an organization. The secretary must be able to select the most appropriate one from those that are available. What is to be copied, when it will be needed, and how it will be used must be considered when selecting a process. After a process has been selected and the master prepared, the desired number of copies are run off on the appropriate machine.

Unit Goals

1. You will be able to prepare copy for photo-copying machine, prepare spirit masters, and type an offset paper master.

2. You will be able to operate a "Thermo-Fax" copying machine, an illuminated drawing board, a "Standard" fluid duplicator, and a "Gestetner" stencil duplicator.

Texts and Materials Needed

1. Secretarial Office Practice

2. Vocational Office Typing

3. College Typewriting

4. Letterhead stationary

5. Thermo-Fax copy paper

6. Thermocopy master

7. One spirit master and red, green, blue, and black carbons

8. Two regular stencils

9. One bulletin stencil

10. One offset paper master

11. Tracing sheets

162889

12. Correction fluid

13. Lettering guides, stylus, and shading plates

14. Duplicating paper

Procedure for Completing Unit

1. Read and study the reference material given in each assignment.

2. Use the following procedure for obtaining materials and caring for equipment:

   a. Obtain stencils, masters, lettering guides, shading plates, and tracing sheets from the duplicating cupboard.

   b. Set up the illuminated drawing board on the duplicating table at the back of the room.

   c. Replace lettering guides and styli after each use in their proper containers.

   d. Replace the tracing sheets in the proper loose-leaf and in the correct numbered order. Do not remove tracing sheets from the room.

   e. Clean the flexible writing plate for the illuminated drawing board when necessary.

   f. Be careful not to waste duplicating supplies and paper.

   g. Put away equipment and materials at the end of class.

3. Use the following procedure for typing and correcting a stencil:

   a. Type the material on paper first so that you can position the copy more accurately on the stencil. Use the same size paper as will be used for the final copies. Be sure to keep your typing within the marginal limits of the stencil or at least 3/4 inch.

   b. Use an electric typewriter, set the ribbon on "stencil" position (so the type does not print), and check to see that the touch is not too heavy.

   c. Clean the type with a dry brush. Make sure the typewriter keys that collect ribbon ink most easily--o, p, m, w, e, and so on--are completely clean; otherwise they will not

162[illegible]

cut a clear impression. Type over the entire keyboard several times on scrap paper in order to remove any trace of ribbon ink.

d. Place a cushion sheet between the stencil and the backing sheet. The coated, or glossy surface of the cushion sheet should be next to the stencil. Film should be placed on top of the stencil.

e. Insert a stencil in the typewriter and straighten if it is necessary. Observe carefully the margin guides printed on the stencil.

f. Use the following basic steps in correcting an error on a stencil:

(1) Turn the stencil upward in the machine a line or two so that the error can be reached readily. Detach the film and lay it over the hood of the machine.

(2) Use a glass burnisher or a paper clip to rub the surface of the error to "close" the fibers separated by the error.

(3) Open a bottle of correction fluid; dip the brush into the fluid, pressing it lightly against the neck of the bottle to release any excess fluid from the brush. Apply the fluid to the burnished area in one or two vertical strokes. Do not put a heavy layer of fluid on the error. Let it dry 30 seconds. Be sure to close the bottle as quickly as possible because the evaporation rate is high; and, when the fluid becomes thick, corrections are poor.

4. Use this procedure for typing and correcting an offset master:

a. Make sure that you know the correct placement of the material before starting to type the master. It is wise to make a model copy on plain paper before beginning to type the master.

b. Be sure your typewriter keys are clean.

c. Make sure that your typewriter has a carbon ribbon and a wide enough carriage to accommodate the master horizontally.

d. Move the paper bail rollers to the extreme right and left edges of the master.

e. Insert the master into the typewriter, being careful not to crease or crack the master. Any cracks or crease marks will reproduce. All typing is done on the white or ruled side of the master.

16291

f. Use a uniform touch in typing, sufficient to deposit an even, uniformly dark image. Too heavy a touch results in embossing on the opposite side of the master. Embossment is undesirable since the embossed letters may be pressed beyond the reach of the ink roller of the offset duplicator, resulting in hollow-looking reproduction. On an electric typewriter, the pressure control should be set to the lowest position where all characters will print.

g. Use an offset or soft eraser to make corrections. Erase the image very lightly. Remove the error as completely as possible. It is not necessary to remove the stain or ghost image left by the dye from the typewriter ribbon, as this stain will not reproduce. It is necessary, however, that the slick surface of the area being erased is left unharmed. Be sure to keep the eraser clean by frequently rubbing it on a piece of clean paper.

5. Refer to the examples of finished assignments which will be posted on a bulletin board or may be found in a file folder in the duplicating cupboard. These are only examples and should not be copied.

6. Illustrate some of your assignments. Pictures or tracing sheets that may be used are available in the duplicating cupboard or you may use pictures from magazines, newspaper, coloring books, etc.

7. Ask for help if there is any assignment that you do not understand. Do not hesitate to obtain the assistance from your teacher.

8. Sign your name on the heading of each stencil or in the lower right-hand corner of each master.

9. Consult your teacher when you have completed an assignment area. You will then be shown how to operate the appropriate machine. DO NOT ATTEMPT TO OPERATE ANY MACHINE WITHOUT YOUR TEACHER BEING PRESENT.

10. Hand in all assignments for evaluation. They will be judged on neatness, placement, quality of reproduction, and originality.

<u>Assignments</u>

1. Read and study pages 351-363 in <u>Secretarial Office Practice</u> which deal with office copying machines. During this assignment, you will be using a "ThermoFax" machine or the infrared process which is described on pages 353-355.

16292

a. Type a letter on letterhead stationary. You may use a letter from your shorthand textbook or any typewriting textbook. Be sure that you type this letter on a typewriter that has a dark ribbon. Make a photocopy of this letter on the "Thermo-Fax" machine. (5 points possible)

b. Complete Problem 161C on page 276 in College Typewriting. On a plain sheet of typewriting paper, type a copy of this project. Be sure that you type this letter on a typewriter that has a dark ribbon. Make a thermocopy spirit master of this project using the "Thermo-Fax" machine. Run off 5 copies on the fluid duplicator. (5 points possible)

2. Read and study pages 386-392 in Secretarial Office Practice which deal with fluid duplicating. Obtain a master sheet. Using the fluid process, make a multi-colored master. Use red, green, purple, blue, or black carbons. You must use at least three colors and your illustrations must depict a central theme such as Mother's Day or Christmas. You need not use the lettering guides. Use the illuminated drawing board for tracing the picture on to the master sheet with a light pencil outline, then copy the illustration using carbons and a pen outline. DO NOT TRACE DIRECTLY ON TO THE ILLUSTRATIONS YOU ARE COPYING WITH PENCIL OR PEN. Run off 5 copies on the fluid duplicator. (20 points possible)

3. Read and study pages 366-383 in Secretarial Office Practice which deal with stencil duplicating.

a. Obtain a regular stencil. Using the stencil process, type up a form letter. On the electric typewriter, type the letter on page 236 in Vocational Office Typing. Use your own name as executive secretary. Omit the inside address and the salutation. Run off 10 copies on the stencil duplicator. After you have run off this assignment, type the inside address and salutation in. Use the names and addresses listed on page 237. (20 points possible)

b. Obtain a regular stencil. Using the stencil process, make an illustration using lettering guides and tracing sheets. Announce some event or advertise some type of merchandise. Your assignment should be complete as to when, where, and what. You will be using regular 8 1/2" by 11" paper so do not go beyond the horizontal line indicating this size paper on your stencil. Run off 5 copies on the stencil duplicator. (20 points possible)

c. Obtain a bulletin stencil. Using the stencil process, make a French fold program or card. In preparing a program, list the menu (if it is a dinner program),

16293

program, committee members, etc. Strive for simplicity in your illustrations and use the smaller lettering guides. Make a copy of what you want to reproduce on a regular sheet of paper folded in fourths before cutting the stencil. BE SURE THAT THE TOP OF YOUR ILLUSTRATIONS OR LETTERING FACES THE CENTER OF THE STENCIL ON BOTH HALFS OF THE PROGRAM OR CARD. (15 points possible)

4. Read and study pages 395-406 in Secretarial Office Practice dealing offset and other reproduction processes. Type an offset master of Problem 157C in College Typewriting on page 271. Type this exercise up in rough-draft form preparatory to typing on the offset master. (15 points possible)

16293

16294

UNIT INSTRUCTION SHEET

On-the-Job Training

The day and the hour is here. This unit will provide you with actual job situations. Your success in this unit will depend upon yourself, your relationship with others, and your efficiency on the job. Your work reflects you. Do a good job.

Unit Goal

1. You will be able to perform in actual "On-the-Job" situations by aiding the administration, teachers, and organizations in the school; or assisting in projects for the community.

Materials Needed

1. "On-the-Job" report form

Procedure for Completing Unit

1. Obtain your instructions from the person for whom you are working. Each assignment will be different.

2. Get off to a good start by working efficiently. Follow these five suggestions to increase the efficiency of your work:

   a. Follow directions. Do the job exactly as it is outlined to you. Be sure to listen to the directions carefully.

   b. Ask questions. If you are not sure how you should go about an assignment, ask your "employer."

   c. Produce your work on time. If your "employer" is waiting for something you are doing, complete the work even if it keeps you overtime.

   d. Maintain high standard. Whatever work you produce, keep your production standards high. No copy should leave your machine until you are absolutely positive that there is not a mistake in it, that corrections are not obvious and that the paper is smudge free.

   e. Check your facts and figures. Check all facts, figures, titles, names, addresses, and dates at their source whenever it is possible.

16285

3. Keep an accurate record of the time involved in completing your assignment. Fill out an "On-the-Job" report form for each project that you complete.

Assignment

1. Spend at least 10 hours performing in actual "On-the-Job" situations during the year.

UNIT INSTRUCTION SHEET

Bulletin Boards

Bulletin boards give the classroom or the office a lift, a sparkle, and a personality. They can be used for announcements, current news, presentation of a theme (seasonal or subject). To be effective they must be "eye catching" and put over the idea intended.

Unit Goal

1. You will be able to plan, prepare, and display two bulletin boards. A total of twenty-five points will be given for each board--10 points for originality, 5 points for following instructions, and 10 points how well you present your idea.

Procedure for Completing Unit

1. Decide on a subject. It should be timely and informative; it should have true educational value; it should have the virtue of simplicity; and it should have a focal point of interest.

2. Work out a caption. Here originality is the most important consideration. The possibility of humorous treatment is another point to keep in mind. As for an idea, you can frequently get a good one by playing with a song, book, or movie title; also, proverbs and idiomatic phrases offer good points of departure.

3. Gather your materials. Keep it clear, complete, concise, attractive, and colorful. Cartoon characters can be used effectively.

4. Plan your arrangment. Keep in mind that three colors are better than two. Try to get an effect of action. Use real objects--dolls, pipe cleaner, toys, flags, cotton snowmen, leaves, pine branches,popcorn blossoms, angel hair clouds, marshmallow eyes, candy spearmint leaves.

5. Decide on your lettering. Use string, rope, ribbon, or cut-out letters in varied sizes.

6. Complete a minature copy on 8½" by 11" construction paper. This copy should be done in color and a full description of materials to be used should be written on the back along with the names of the students preparing the bulletin board.

7. Submit your minature copy to your teacher one week before the bulletin board is due. You will be assigned a date to display your board and will be expected to have it ready on time.

16297

The Importance of Lettering:

The shape of any machine, building or piece of furniture may be shown by a drawing consisting of one or more views. This drawing is known as an orthographic drawing. The information as to size, methods of manufacture, kinds of material, types of finish and other notes is placed on the drawing by freehand lettering.

Origin of Lettering: The historical background of lettering is very interesting. The Egyptians, Babylonians, Hebrews, Greeks and Romans all contributed to the development of the alphabet which is now commonly used by English speaking peoples. It is called the Roman alphabet. A modification of this alphabet, called the Gothic, is the one generally used by draftsmen. It occurs in two forms, the slant and the vertical. The vertical style of capitals is the one preferred in most drafting rooms and is the one to be used exclusively in the drawings of this course.

Guide Lines: Horizontal guide lines are necessary to keep the letters uniform in height and in a straight line. These guide lines should be drawn very lightly with a soft pencil (F or HB).

Spacing and Composition: Letters in words should be so spaced that a pleasing, uniform tone is secured in the overall appearance of the lettering area. The areas between letters should be equalized rather than the spaces between the nearest points of adjacent letters. This is illustrated on the Lettering Chart, page 11, line two.

Comparative Proportions: The normal ratio of the width of a letter to its height is 4 to 5. In other words the width is normally four-fifths of the height. Some letters such as O, M and W are ex-

1628 1627

Assignment

1. Complete two bulletin boards during the year. You will be working in pairs. One of the bulletin boards should apply to the secretarial field and the other to any area of business.

16298
16297

UNIT INSTRUCTION SHEET

Secretarial Typing

Certainly, one thing is true: you will encounter a wide variety of tasks in a secretarial career. These tasks include taking dictation and transcribing letters and memorandums, typing duplicating masters, adapting form letters, typing from rough drafts, composing replies to incoming mail, working itineraries and making travel and hotel reservations, keeping petty cash records, and making out payroll statements.

Unit Goal

1. You will be able to perform the everyday tasks of the secretary on the job. This will be accomplished by completing a practice set which is designed to simulate as closely as possible the secretary's actual working experience.

Text and Materials Needed

1. The Secretary on the Job (Practice set)
2. Carbon paper
3. Supplementary instructions

Procedure for Completing Unit

1. Keep the following points in mind when completing the 28 jobs in The Secretary on the Job:

   a. Refer to pages 1 through 30 of the "Source Material" booklet for notes and correspondence you must refer to in order to complete some of the assignments.

   b. Suggestions to aid you in completing some assignments have been duplicated.

   c. Use the "Working Paper" on pages 33 through 59 for business forms needed to complete jobs. Stationery is provided for originals of correspondence only. When instructed to type and envelope, use one of the envelopes included in the practice set. Make an envelope on plain paper for all other correspondence.

   d. Refer to pages 1 through 5, which contain information on procedures, throughout this unit.

16299

e. Use the rules for Word Division on pages 4-5 of the "Source Material" when hyphenating a transcript.

f. Material to be dictated will appear on transcribing belts.

g. Use a spirit master when an assignment requires that a letter or memorandum be typed on a stencil or spirit duplication master. Copies should be run off on plain paper. Use the necessary heading at the top of a memorandum that is to be duplicated.

h. Maintain a chronological file of all correspondence and reports.

2. Ask for help if there is any job that you do not understand. Do not hesitate to obtain assistance from your teacher.

3. Critize your work. After completing each job, proofread carefully and pay special attention to numbers. Every page should be attractive, neat, and accurate. Every original page will be worth 10 points.

4. Hand in each job for evaluation.

Assignments

1. Complete the 28 jobs contained in the practice set, The Secretary on the Job, in their proper sequence.

Individualized Vocational Curriculum for Secretarial and Clerical Office Procedures at Weber High School.

Weber County School District, Utah.
MF AVAILABLE IN VT-ERIC SET.
PUB DATE - Jul70 101p.

DESCRIPTORS - *BUSINESS EDUCATION; *INSTRUCTIONAL MATERIALS; OFFICE PRACTICE; *INDIVIDUALIZED INSTRUCTION; TESTS; *ASSIGNMENTS; *PROGRAMED MATERIALS; SECONDARY EDUCATION; BEHAVIORAL OBJECTIVES; OFFICE MACHINES; DATA PROCESSING; COOPERATIVE EDUCATION

ABSTRACT - With the support of school administrators, two business education teachers developed this package of individualized curriculum materials. These materials are arranged in five parts which pertain to secretarial procedures, office machines, business machines, and on-the-job training. Following the continuous progress approach, this document includes assignments and quizzes for each of the above units as based on selected textbooks. Behavioral objectives for the student and instructions for the teacher are also included. The unit covering on-the-job training provides a student evaluation sheet. (JS)

INTRODUCTION

The philosophy of the continuous progress individualized instruction business curriculum of the Weber High School is to enable the student to progress at his own rate according to his ability. Not only do we feel that a student should be allowed to progress at his own rate, but also that he should have the opportunity of choosing the areas in which he has an interest. Therefore, many courses have been set up with the student in mind so that he may prepare himself for work upon completion of high school. Courses selected should be of the student's choosing.

Behavioral objectives are established for each course and unit within the course. Performance standards, based on the norms of average ability which have been derived from past experience in traditional teaching and recommendations from the Business and Marketing Education Guide for the Utah State Board of Education, have been set. Each student must reach this criterion before he is allowed to progress to the next unit in each course. If a student does not reach the standard, he is given supplemental material and help from the teacher to reinforce his learning and to bring him to the standard established; thus, enabling him to move to the next unit. In this manner a student is able to proceed at his own rate and ability.

Instructional material has been developed so that the course is equivalent to one-fourth or one-half credit. The student selects the material he desires as he proceeds successfully from one course to another. Upon the successful completion of any specific individualized course, the student is awarded credit and a letter grade.

In this program, an accelerated student has the opportunity to complete several courses in a year's time. On the other hand, if a student needs more time to complete the course, he may take the time

16305

necessary and still receive credit and a letter grade upon completion instead of experiencing failure for not being able to "keep up" with the class. Through his own selection, he also has the opporutnity to work on material in which he has special interest.

It is important that no grade or credit be issued until the student has completed the requirements for the course. The grade and credit can then be recorded on the student's permanent record.

16306

INSTRUCTIONS FOR THE TEACHER

The following courses dealing with the various tasks of a secretarial or clerical position have been set up to take the second hour of a two-hour block with Shorthand II or a one-hour class:

Secretarial or Clerical Procedures	one-half credit
Office Machines	one-fourth credit
Transcribing and Duplicating Machines	one-fourth credit
Business English	one-half credit
On-the-Job Training	one-half credit

The student has the opportunity to complete as many of the above courses during the year as she can according to her individual ability. Each course is complete in itself as to letter grade and credit received. All students are required to complete the course on Secretarial or Clerical Procedures. Other than this requirement, the student may choose the course or courses in which she has the most interest.

Suggestions for the teacher pertaining to each individual course are given in the following paragraphs:

SECRETARIAL OR CLERICAL PROCEDURES

I. Review of Typing

It is suggested that this unit be given to the class as a whole the first week of school inasmuch as it is merely to refresh the student's memory on some of the basic rules of typing.

Two No. 10 envelopes should be provided for each student for this unit.

The business form that the student is required to complete could be a form made out to give you personal information on the student. These forms should be duplicated so that all the student

16307

ceptions. The comparative proportions of the letters are shown on your lettering chart where the widths are indicated in units above or below each letter.

You may now complete Work Sheets numbers 5 and 6. Turn to page 16.

has to do is fill in the information necessary.

If the handout "The Typing of a Master Sheet" is duplicated on a spirit duplicating machine, it will show the student the difference between mimeograph and spirit duplicating.

II. Traits of a Successful Secretary

At the end of the school year, the assignments in this unit should be returned to the students to be included in their reference manuals.

The tape mentioned in Assignment 11 is a tape that the teacher can make up giving special hints on how to become a super secretary. This assignment can be omitted if you desire.

Traits of a Successful Clerical Worker

You will notice that under the Clerical Office Course, Units I, III, IV, and V have been omitted. This is because the student in Clerical Office Typewriting may select the same units that are printed under Secretarial Procedures. Units II and VI are written specifically for the clerical office typewriting student.

At the end of the school year, the assignments in this unit should be returned to the students to be included in their reference manuals. This will eliminate circulation of completed jobs to other students.

III. Meeting the Public

Appointment forms and telephone forms should be made available for the students.

The Mountain States Telephone Company is cooperative in supplying resource personnel and materials to enrich the telephone section.

On Assignment No. 7 of the unit "Meeting the Public by Telephone", have a tape available for the student to record her voice. If tape recording equipment is not available, this assignment may be omitted.

IV. Filing

It is suggested that the following assignments be used as tests: After Job 12, 12C or 12D; after Job 26, 24C or 24D; after Job 32B, 32C or 32F.

Before these tests are taken, the students should hand in all of their assignments up to that point and arrange their filing cards for that section back in numerical order.

V. Mail Service

The latest Postal Guide furnished by the post office should be available for student use.

VI. Practice Set (Secretary on the Job)

This practice set does not include enough envelopes to have one for each letter; therefore, it is necessary either to supply the students with extra envelopes or give each student a No. 10 envelope guide made from poster paper so that it can be traced on the back of the letters without envelopes.

Because the students complete this practice set at different times, it is suggested that all material be kept in the student's individual file and returned at the end of the year. This will prevent students using each other's assignments.

As the students will complete this unit on an individual basis, the material to be dictated throughout the set should be on tape so

that the material does not have to be dictated to each student individually by the teacher.

Practice Set (Typewriting Office Practice)

This practice set contains all the materials needed for the various jobs. Students should be reminded to use their material carefully.

The students have been instructed to hand in each job as it is completed. You may, of course, have them hand their work in as you desire for checking.

The students will be completing jobs at different times and so it is suggested that all papers be kept in an individual file until the end of the year to prevent circulation.

OFFICE MACHINES

I. Ten-Key Adding and Printing Calculator, Electronic Calculators

Answer sheets must be prepared and provided for the students. Name, job number, machine used, date, and class period should be indicated on the form. Lines should also be drawn, but numbers should be omitted so that the students can fill them in as needed.

You can make up your own tests or use the tests provided by the publishers for specific machines.

II. Data Processing

The four tests given are the review tests in the data processing text. These lessons should be removed from the text and given to the students as needed and should not be used as an open-book test.

The practice problems mentioned in Assignment 11 can be as simple or complex as you want to make them according to the material

you have covered and the time you want to spend. You want the student to be capable of operating the machine.

If the students desire further instruction and practice on the keypunch machine, the taped course put out by IBM Corporation may be used.

TRANSCRIBING AND DUPLICATING MACHINES

II. Duplicating Machines

Displays of the various types of duplicating problems should be placed on a bulletin board for students to see.

BUSINESS ENGLISH

I. Business English Essentials

In part IV students should be reminded that the letters and worksheets are to be handed in together as indicated in the textbook.

The two spelling lists should be given to the students when the book is issued. As indicated in the assignments, one test will be given after Part II is completed and the other after Part IV. The tests should be 50 words each taken from the corresponding lists.

II. Sources of Information

A number of the books required in this unit may be on your reference shelf, however, it is suggested that you encourage the students uo use the library. This will give them the experience in a library situation of finding the materials needed.

III. Spelling Improvement

The diagnostic tests and the achievement test should be removed

and placed in plastic protective sheets so they can be given to the students as needed.

ON-THE-JOB TRAINING (Or Simulation)

On-the-Job Training in the school offices is given where simulated office is not in effect. You will note that the On-the-Job work carries one-half credit inasmuch as the student works for two hours a day for nine weeks. If you use a simulated office unit for one hour a day, only one-fourth credit should be issued. However, credit should be determined according to the amount of time spent on a simulated office unit.

The evaluation sheet attached to the course is merely an example of what can be used. It is felt that any form used should include at least the categories listed.

PART ONE

SECRETARIAL OR CLERICAL PROCEDURES

16313

SECRETARIAL PROCEDURES

At secretary is supposed to be a "Jill-of-all-trades," which includes being a psychologist, politician, diplomat, research expert, memory shark, writer, business lawyer, machinist, personal banker for her boss, errand girl, and desk duster. furthermore, she is a mind reader, voice culturist, and clothes model. She is calm, polite, dignified, charming, good-natured, and unswervingly loyal to her boss.

Ralph Knight

- - - - - -

BEHAVIORAL OBJECTIVE

At the conclusion of this course, you will be able to perform the various tasks of a secretary. Shorthand and typewriting are only two of the many skills and abilities a qualified secretary must have. These skills are covered in the Shorthand II course. To succeed in the secretarial field, you must have the ability to adjust yourself to the numerous requirements of the position. During the course you will complete units pertaining to these requirements. Standards of performance are included in each of the units.

- - - - - -

The following units will be covered in this course:

I. Review of Typing
II. Traits of a Successful Secretary
III. Meeting the Public
IV. Filing
V. Mail Service
VI. Practice Set (The Secretary on the Job)

The ability to understand and follow instructions is high on the list of desirable traits in business. To help develop this trait, you will be working on each unit individually and, therfore, it is necessary that you read and follow each instruction sheet carefully.

After successfully completing the above units, a letter grade and one-half credit will be awarded.

16314

UNIT I

REVIEW OF TYPING

BEHAVIORAL OBJECTIVE:

At the conclusion of this unit the student will have demonstrated his skill in typing a business letter, memorandum, tabulation problem, spirit master, stencil, and filling out a business form. The student will also demonstrate his skill in cleaning a typewriter and changing a ribbon. No test will be given.

This is a short unit used as a refresher on problems that will occur in various units throughout the year. Basic principles will be reviewed.

Reference Books:

20th Century Typewriting, Eighth Edition; Lessenberry, Crawford, and Erickson; South-Western Publishing Company; Cincinnati, 1962.

Applied Secretarial Practice, Sixth Edition; Gregg, Fries, Rowe, and Travis; McGraw-Hill Book Company; New York, New York, 1968.

Assignments:

1. Review the parts of the business letter as illustrated on the attached sheet.

2. Turn to page 317, Problem 2, in 20th Century Typewriting. Follow the book directions. This letter is to go airmail so make the proper indication on the letter and envelopes. Don't forget the zip code. You will be given two #10 envelopes for this assignment. Use your name and the school address for the return address on the envelope. Insert the letter in the correct envelopes. (Refer to page 172 in the typing book for instructions on folding letters.)

3. Hand in your letters, using a paper clip to clip them together.

4. Type the interoffice memorandum, Problem 3, page 272, of your typing book. Make three carbon copies. (This includes one copy for the office file. Most offices will have their own printed interoffice correspondence form. However, some offices do not and you would have to make up your own form. In this assignment, you will type your own form. An illustration appears on page 269 and 270 of the type book.

Be sure your name is in the upper left corner of your paper. Staple all copies together and hand them in for checking.

16315

THE TYPING OF A STENCIL

A stencil is a sheet of tissue paper coated with plastic, wax, or gelatin. For convenience in handling, stencil sheets are fastened by the manufacturer to stiff backing sheets. As you type on a stencil, its thin coating is pressed aside where the type bars strike the coating, thus permitting ink to flow through each opening when the stencil is, later, placed on the duplicating machine.

The typing of a stencil consists of these steps:

1. Prepare the copy--verify that it is correct and can be typed with margins of at least 3/4 inch.

2. Prepare the machine--clean the type bars and disengage the ribbon by setting it for stencil work.

3. Prepare yourself--read the directions printed on the package in which the stencils come (instructions vary in some details in different brands).

4. Prepare the stencil--insert a "Cushion Sheet" (a number of these tissue sheets are packed in each quire) between the stencil and its backing sheet.

5. Insert the stencil in the typewriter and begin to type, using a very even and very firm touch.

If an error is made, the stencil coating must be smoothed out and strengthened; then the correction can be typed. These are the steps for correcting an error:

1. Smooth out the error--rub the coating back into position by rubbing the area gently with a glass burnisher (it comes in the box with the correction wax) or round end of a smooth paper clip.

2. Strengthen the area--put a light coating of wax over it. The wax is called "Correction Fluid" and comes in a small bottle with a brush cap.

3. Type the correction.

4. When the stencil is finished, remove the tissue cushion gently; it sometimes adheres to the correction fluid and can cause rips in the stencil.

ILLUSTRATION SHEET I.

1629

THE TYPING OF A MASTER SHEET

A "master" is a sheet of special glossy paper, fastened at the bottom to another sheet that is coated with a layer of carbon containing a special reproducing dye. When you write on the master, carbon is transferred from the backing sheet to the back of the master sheet; then later, when the master is placed on the duplicating machine, copies are made when other sheets of paper, dampened by a chemical in the machine, are pressed against the carbon on the back of the master.

Typing the master sheet consists of these steps:

1. Prepare the copy--verify that it is correct.

2. Prepare the typewriter--clean the type.

3. Prepare yourself--read the directions on the box in which the master packs come.

4. Prepare the master pack--remove the protective sheet that separates the master page from the carbon page.

5. Insert the master pack, being sure to insert the unbound end first. Type with a very even touch.

Making a correction is a matter of removing the carbon of the error and replacing it by the carbon of the correction, a process that can be done in many ways. The usual procedure:

1. Roll the paper up and bend the master toward you to expose the carbon that contains the error.

2. Using a blade (knife or razor), carefully scrape off the carbon that contains the error.

3. Place a slip of unused carbon (cut from another sheet of the carbon paper) between the backing sheet and the master in such a way that the new carbon will be at the point of the correction.

4. Roll the paper back to the typing position and type the correction without erasing the original incorrect typewriting.

5. Pause to remove the slip of carbon paper; then continue typing the rest of the job.

UNIT II

TRAITS OF A SUCCESSFUL SECRETARY

BEHAVIORAL OBJECTIVE:

The student will demonstrate her knowledge of the attitudes and personal appearance appropriate for the secretary on the job. This will be accomplished by completing the various assignments listed in the unit. No test will be given. In order for the student to successfully complete this unit, she must do all the assignments. The evaluation will be determined by the completeness of answer and neatness of presentation.

- - - -

Your boss does not want glamour and showiness in his secretary. He does, however, value his secretary for her good good grooming, her intelligent choice of clothing, and her pleasing personality. To achieve this smart appearance, every detail of your personal appearance must become a daily routine. Your image reflects your boss and your company. You are your company. START NOW to acquire and refine these traits that will win the respect and admiration of your employer, your co-workers, and the public.

Assignments:

On the following assignments, unless otherwise directed, type the questions first and then the answers. You may set them up in any style you want. These assignments can be used as reference material for you later.

1. Complete the attached chart, "How Do You Look."

2. Choose a book from the reference shelf and read the chapters that deal with personal qualities, appearance, attitudes, career, and general image of a successful secretary. Use the table of contents to locate the information dealing with this assignment.

3. In one column list four main points about your face and figure that you must consider in selecting attractive clothing. Opposite these points in the second column, briefly describe the general style of clothing you should choose to emphasize your good points and minimize your poor points.

4. Prepare a page illustrating the correct dress and general appearance for a secretary. Pictures may be obtained from catalogues, magazines, etc.

5. Complete the attached "How Well Do You Know Yourself?" chart.

6. Experienced stenographers and secretaries have often been faced with the questions listed below. How would you answer them? Use a separate sheet of paper for your answers. (Be sure to type the question first.)

   (a) Should I tell my co-worker that her constant humming at the desk disturbs my concentration? If so, how should I go about it?

   (b) I'd like to change my lunch hour so that I can go with my friends. Should I ask permission of my immediate supervisor, or should I simply work it out with my associates?

16321

(c) When my boss is away, I sometimes run out of work. I like to keep busy, and I could help one of the other secretaries who is often overloaded. Should I offer my services? How do I go about it tactfully?

(d) Sometimes when I am on the telephone, two or three people gather around and begin noisy conversations. How should I handle this problem?

(e) One of the stenographers under your supervision has been careless about her dress lately. Would you:

(1) Ignore the matter, hoping she will improve?

(2) Call her aside and speak to her tactfully about the importance of good grooming every day?

(3) Give hints and suggestions that you know she can overhear?

7. Janet Martin is executive secretary to Mr. Phillips, president of the Phillips Paper Company. Janet handles many confidential matters, such as salary reports, personnel changes, and advance market information. Her job requires the utmost in diplomacy. Answer the following questions on a separate piece of paper: (Applied Secretarial Practice, Fifth Edition, page 47)

(a) Recently, Mr. Daugherty, a young executive, told Janet he heard a rumor that several executives were getting salary increases and he wondered if he were included. If you were Janet, how would you handle this situation?

(b) A customer comes in while Janet is typing a confidential report concerning advance market information. Realizing that this information would be of interest to the customer, Janet must greet the caller in such a way that he does not see the report. How should she handle this situation?

(c) What precautions can you take when handling confidential matters on which you are working at your desk? At your typewriter?

8. Answer the following questions on a separate piece of paper: (Make short answers.)

(a) How does poor health affect the secretary's opportunities for advancement?

(b) What harm is there in office gossip?

(c) How does the secretary's punctuality and reliability affect the operation of her employer's office?

(d) What is tact? What part may tact play in the work of the secretary?

(e) What do we mean by the expression, "follow-through" when referring to desirable work habits?

(f) Why should a secretary include the reading of a newspaper in her daily activities?

10. Using the title "My Secretarial Future," describe the type of position you would like to have upon completion of your preparation for secretarial work. Answers to the following questions might be included in your description:

(a) What type of business do you think you would prefer--for example, a law firm, an insurance company, a store, a railroad office, a government office, or a doctor's office?

(b) Would you prefer to work in a large or a small office? Would you like a position in which you would be meeting many people from the outside, one in which you would work by yourself, or one with only a few people within the organization? (Applied Secretarial Practice, Fifth Edition, page 10)

11. Obtain the tape on "How to Become a Super Secretary" from your teacher. Listen carefully to this tape. It will give you a complete review of this unit.

12. Hand your completed assignments to your teacher and you will be given your next unit (Meeting the Public) in this course.

16322

HOW DO YOU LOOK?

Score yourself on these important grooming factors as follows:

Yes--3 points Most of the time--2 points
Seldom--1 point

	Yes	Most of the Time	Seldom
Clothing			
1. Do you choose clothes that are becoming to your figure?	___	___	___
2. Do you wear colors that look well on you?	___	___	___
3. Do you avoid extremes in style?	___	___	___
4. Do you wear clothes appropriate to the occassion?	___	___	___
5. Do you keep your clothes free from ripped seams, tears, frayed collars and cuffs, uneven hemlines?	___	___	___
6. Do you keep your shoes in good condition, with the heels and toes in repair?	___	___	___
Accessories			
7. Are your accessories always appropriate for your outfit?	___	___	___
8. Do the belts and scarves you wear harmonize with your outfits?	___	___	___
9. Do you refrain from wearing too much jewelry?	___	___	___
10. Do you keep your gloves clean?	___	___	___
Personal Cleanliness			
11. Do you bathe at least once a day?	___	___	___
12. Do you bathe soon after participating in strenuous activities?	___	___	___
13. Do you wash your hands before meals?	___	___	___
14. Do you use an effective deodorant daily?	___	___	___
15. Are your undergarments kept fresh and clean?	___	___	___
16. Do you keep your outer garments free from dandruff, lint, and so on?	___	___	___
17. Do you have a dental check-up at least once a year?	___	___	___
18. Do you brush your teeth at least twice a day?	___	___	___
19. Do you use a preventive as often as necessary to avoid offensive breath?	___	___	___
20. Do you wash your hair at least once a week?	___	___	___
21. Do you brush your hair daily?	___	___	___
22. Are your fingernails clean and filed to moderate length?	___	___	___

16323

	Yes	Most of The Time	Seldom
Grooming Details			
23. Do you refrain from biting your fingernails?	___	___	___
24. Do you remove or repair nail polish when chipped?	___	___	___
33. Is your makeup applied in moderation?	___	___	___
34. Do you avoid applying makeup in public	___	___	___
35. Do you keep your hair neatly brushed or combed?	___	___	___
36. Do you avoid combing your hair in public?	___	___	___
37. Do you use a suitable perfume or cologne and the right amount of it?	___	___	___
Health			
38. Do you eat three well-balanced meals every day?	___	___	___
39. Do you drink pleaty of milk and water daily?	___	___	___
40. Do you avoid eating anything that you know is harmful to your complexion?	___	___	___
41. Do you watch your weight carefully and try to keep it at the recommended weight for you?	___	___	___
42. Do you get sufficient physical activity?	___	___	___
43. Do you have physical check-ups regularly?	___	___	___
44. Do you get enough sleep each night?	___	___	___
Posture			
45. Do you sit properly, without slouching?	___	___	___
46. Do you stand properly, with back erect, shoulders back, stomach in?	___	___	___
47. Do you walk confidently, with poise and good posture?	___	___	___

HOW DO YOU RATE?

If your score is over 105 You look sharp!
If your score is 85-104 You're average
If your score is below 85 Better work hard to improve your grooming!!

16324

HOW WELL DO YOU KNOW YOURSELF?

Instructions::Rate yourself to the best of your ability in the appropriate column. If your answer is not a definite yes or no, use the (?) column. Score yourself as follows:

Yes--2 points ?--1 point No--0 points

Your Work Habits	Yes	(?)	No
1. Do you listen to directions carefully so that you don't have to ask too many questions?	___	___	___
2. Do you plan ahead so that you can keep more than one job moving?	___	___	___
3. Do you do a job in the best or the most suitable way, such as studying your problem and then arranging the procedure logically?	___	___	___
4. Do you do your best whether you enjoy what you are doing or not?	___	___	___
5. Do you usually do things right the first time?	___	___	___
6. Do you stick to a job until it is done?	___	___	___
7. Do you get your assignments done well, inspite of interruptions?	___	___	___
8. Do you study your lessons consistently?	___	___	___
9. Do you keep your materials and equipment neat and in order?	___	___	___
10. Do you have necessary supplies for class each day?	___	___	___
11. Are you proud of the work you do?	___	___	___
12. Do you work accurately and rapidly?	___	___	___
13. Do you proofread your work well?	___	___	___
14. When confronted with a question, do you try to find an answer yourself?	___	___	___
Your Honesty and Dependability			
15. Are you honest when you have a test?	___	___	___
16. When you are asked for your hones opinion, are you sincere?	___	___	___
17. Do you meet obligations promptly?	___	___	___
18. Are you the type of person who can be relied upon?	___	___	___
19. Do you submit your assignments at the time they are due?	___	___	___
20. Can you finish a job without being reminded several times?	___	___	___
21. Do you actually work on your studies when you are given time to study them?	___	___	___

1. Gregg, Frees, Rowe, and Travis, Workbook for Applied Secretarial Practice, Fifth Edition; McGraw-Hill Book Company, Inc., New York, 1962.

16325

	Yes	(?)	No
22. Do you get to classes on time?	___	___	___
23. Are you punctual?	___	___	___
24. Do you admit your mistakes rather than make excuses for them?	___	___	___
25. Can you handle a little extra work?	___	___	___
Your Personality			
26. Do you develop an interest in related areas of activity?	___	___	___
27. Are you sincere in your speech and actions?	___	___	___
28. Do you have confidence in yourself to handle a job or situation well?	___	___	___
29. Do you greet people with a smile?	___	___	___
30. Do you have a good sense of humor?	___	___	___
31. Is the tone of your voice pleasant?	___	___	___
32. Do you speak clearly and distinctly?	___	___	___
33. Do you practice good manners?	___	___	___
34. Do you easily adapt yourself to new situations?	___	___	___
Your Poise			
35. Do youthink of what you're going to say before you say it?	___	___	___
36. Do you dress appropriately for school?	___	___	___
37. Are you well groomed?	___	___	___
38. Do you feel at ease when talking with others?	___	___	___
39. Do you avoid emotional outbursts and displays of temper?	___	___	___
40. Can you discuss something without arguing?			
Your Tolerance			
41. Are you careful not to say things that might offend other?	___	___	___
42. Do you consider the feelings of others in your everyday activities; such as riding the bus, walking down the halls, or sitting in class?	___	___	___
43. Are you open minded and willing to listen to all sides of a question?	___	___	___
44. Do you respect the ideals and feelings of others?	___	___	___
45. Are you courteous and tactful when you come into contact with someone you don't particularly care for?	___	___	___
Your Health			
46. Are you in good physical and emotional health?	___	___	___
47. Do you spend adequate time on your personal cleanliness ?	___	___	___

CLERICAL OFFICE

A secretary is supposed to be a "Jill-of-all-trades," which includes being a psychologist, politician, diplomat, research expert. memory shark, writer, business lawyer, machinist, personal banker for her boss, errand girl, and desk duster. Furthermore, she is a mind reader, voice culturist, and clothes model. She is calm, polite, dignified, charming, good-natured, and unswervingly loyal to her boss.

Ralph Knight

- - - - -

BEHAVIORAL OBJECTIVE:

At the conclusion of this course, you will be able to perform the various tasks of a clerical office worker. Typewriting is only one of the many skills and abilities a qualified clerical office worker must have. This skill has been covered in a regular typing course. To succeed in the clerical field, you must have the ability to adjust yourself to the numerous requirements of the position. During the course you will complete units pertaining to these requirements. Standards of performance are included in each of the units.

- - - - -

The following units will be covered in this course:

I. Review of Typing
II. Traits of a Successful Clerical Worker
III. Meeting the Public
IV. Filing
V. Mail Service
VI. Practice Set (Typewriting Office Typewriting)

The ability to understand and follow instructions is high on the list of desirable traits in business. To help develop this trait, you will be working on each unit individually and, therefore, it is necessary that you read and follow each instruction sheet carefully.

After successfully completing the above units, a letter grade and one-half credit will be awarded.

16328

UNIT II

TRAITS OF A SUCCESSFUL CLERICAL WORKER

BEHAVIORAL OBJECTIVE:

The student will demonstrate her knowledge of the attitudes and personal appearance appropriate for the clerical office worker. This will be accomplished by completing the various assignments listed in the unit. No test will be given. In order for the student to successfully complete this unit, she must do all the assignments. The evaluation will be determined by the completeness of answer and neatness of presentation.

- - - - -

Your boss does not want glamour and showiness in his office. He does, however, value his office workers for their good grooming, intelligent appearance, every detail of personal appearance must become a daily routine. Your image reflects your boss and your company. You are your company. START NOW to acquire and refine these traits that will win the respect and admirations of your employer, your co-workers, and the public.

Assignments:

On the following assignments, unless otherwise directed, type the questions first and then the answers. You may set them up in any style you want. These assignments can be used as reference material for you later.

1. Complete the attached chart, "How Do You Look?"

2. Choose a book from the reference shelf and read the chapters that deal with personal qualities, appearance, attitudes, career, and general image of a successful secretary. Use the table of contents to locate the information dealing with this assignment.

16330

3. In one column list four main points about your face and figure that you must consider in selecting attractive clothing. Opposite these points in the second column, briefly describe the general style of colthing you should choose to emphasize your good points and minimize your poor points.

4. Prepare a page illustrating the correct dress and general appearance for a secretary. Pictures may be obtained from catalogues, magazines, etc.

5. Complete the attached "How Well Do You Know Yourself?" chart.

6. Experienced stenographers and clerical officer workers have often been faced with the questions listed below. How would you answer them? Use a separate sheet of paper for your answers. (Be sure to type the question first.)

   (a) Should I tell my co-worker that her constant humming at the desk disturbs my concentration? If so, how should I go about it.

   (b) I'd like to change my lunch hour so that I can go with my friends. Should I ask permission of my immediate supervisor, or should I simply work it out with my associates?

   (c) When my boss is away, I sometimes run out of work. I like to keep busy, and I could help one of the other office workers who is often overloaded. Should I offer my services? How do I go about it tactfully?

   (d) Sometimes when I am on the telephone, two or three people gather around and begin noisy conversations. How should I handle this problem?

   (e) One of the office workers under your supervision has been careless lately about her dress. Would you:

      (1) Ignore the matter, hoping she will improve?

      (2) Call her aside and speak to her tactfully about the importance of good grooming every day?

      (3) Give hints and suggestions that you know she can overhear?

7. Janet Martin is executive secretary to Mr. Phillips, President of the Phillips Paper Company. Janet handles many confidential matters, such as salary reports, personnel changes, and advance market information. Her job requires the utmost in diplomacy. Answer the following questions on a separate piece of paper. (Applied Secretarial Practice, Fifth Edition, page 47)

16331

(a) Recently, Mr. Daugherty, a young executive, told Janet he heard a rumor that several executives were getting salary increases and he wondered if he were included. If you were Janet, how would you handle this situation?

(b) A customer comes in while Janet is typing a confidential report concerning advance market information. Realizing that information would be of interest to the customer, Janet must greet the caller in such a way that he does not see the report. How should she handle this situation?

(c) What precautions can you take when handling confidential matters on which you are working at your desk? At your typewriter?

8. Answer the following questions on a separate piece of paper: (Make short answers.)

(a) How does poor health affect the office worker's opportunities for advancement?

(b) What harm is there in office gossip?

(c) How does the office workers' punctuality and reliability affect the operation of her employer's office?

(d) What is tact? What part may tact play in the work of the clerical office worker.

(e) What do we mean by the expression, "follow-through," when referring to desirable work habits?

(f) Why should an office worker include the reading of a newspaper in her daily activities?

10. Using the title "My Clerical Office Future," describe the type of position you would like to have upon completion of your preparation for office work. Answers to the following questions might be included in your description:

(a) What type of business do you think you would prefer-- for example, a law firm, an insurance company , a store, a railroad office, a government office, or a doctor's office?

(b) Would you prefer to work in a large or a small office? Would you like a position in which you would be meeting many people from the outside, one in which you would work by yourself, or one with only a few people within the organization? (Applied Secretarial Practice, Fifth Edition, page 10)

11. Hand your completed assignments to your teacher and you will be given the next unit (Meeting the Public) in this course.

16332

Unit II

HOW DO YOU LOOK?

Score yourself on these important grooming factors as follows:

Yes--3 points Most of the time--2 points
Seldom--1 point

	Yes	Most of the Time	Seldom
Clothing			
1. Do you choose clothes that are becoming to your figure?	___	___	___

3. Do you avoid extremes in style?	___	___	___
4. Do you wear clothes appropriate to the occassion?	___	___	___
5. Do you keep your clothes free from ripped seams, tears, frayed collars and cuffs, uneven hemlines?	___	___	___
6. Do you keep your shoes in good condition, with the heels and toes in repair?	___	___	___
Accessories			
7. Are your accessories always appropriate for your outfit?	___	___	___
8. Do the belts and scarves you wear harmonize with your outfits?	___	___	___
9. Do you refrain from wearing too much jewelry?	___	___	___
10. Do you keep your gloves clean?	___	___	___
Personal Cleanliness			
11. Do you bathe at least once a day?	___	___	___
12. Do you bathe soon after participating in strenuous activities?	___	___	___
13. Do you wash your hands before meals?	___	___	___
14. Do you use an effective deodorant daily?	___	___	___
15. Are your undergarments kept fresh and clean?	___	___	___
16. Do you keep your outer garments free from dandruff, lint, and so on?	___	___	___
17. Do you have a dental check-up at least once a year?	___	___	___
18. Do you brush your teeth at least twice a day?	___	___	___
19. Do you use a preventive as often as necessary to avoid offensive breath?	___	___	___
20. Do you wash your hair at least once a week?	___	___	___
21. Do you brush your hair daily?	___	___	___
22. Are your fingernails clean and filed to moderate length?	___	___	___

16333

	Yes	Most of The Time	Seldom
Grooming Details			
23. Do you refrain from biting your fingernails?	___	___	___
24. Do you remove or repair nail polish when chipped?	___	___	___
33. Is your makeup applied in moderation?	___	___	___
34. Do you avoid applying makeup in public	___	___	___
35. Do you keep your hair neatly brushed or combed?	___	___	___
36. Do you avoid combing your hair in public?	___	___	___
37. Do you use a suitable perfume or cologne and the right amount of it?	___	___	___
Health			
38. Do you eat three well-balanced meals every day?	___	___	___
39. Do you drink pleaty of milk and water daily?	___	___	___
40. Do you avoid eating anything that you know is harmful to your complexion?	___	___	___
41. Do you watch your weight carefully and try to keep it at the recommended weight for you?	___	___	___
42. Do you get sufficient physical activity?	___	___	___
43. Do you have physical check-ups regularly?	___	___	___
44. Do you get enough sleep each night?	___	___	___
Posture			
45. Do you sit properly, without slouching?	___	___	___
46. Do you stand properly, with back erect, shoulders back, stomach in?	___	___	___
47. Do you walk confidently, with poise and good posture?	___	___	___

HOW DO YOU RATE?

If your score is over 105 You look sharp!
If your score is 85-104 You're average
If your score is below 85 Better work hard to improve your grooming!!

Unit II

HOW WELL DO YOU KNOW YOURSELF?

Instructions::Rate yourself to the best of your ability in the appropriate column. If your answer is not a definite yes or no, use the (?) column. Score yourself as follows:

Yes--2 points ?--1 point No--0 points

Your Work Habits	Yes	(?)	No
1. Do you listen to directions carefully so that you don't have to ask too many questions?	___	___	___
2. Do you plan ahead so that you can keep more than one job moving?	___	___	___

Below 96	You'd better start improving Now!!

UNIT III

MEETING THE PUBLIC--IN PERSON--BY TELEPHONE--BY LETTER

BEHAVIORAL OBJECTIVE:

At the conclusion of this unit the student will be able to solve the various problems that arise in an office by being able to greet the office caller in an acceptable manner, take care of company business on the telephone, and write letters for her employer. This will be accomplished by completing assignments throughout the unit. No test will be given. In order for the student to successfully complete this unit, she must do all the assignments. The evaluation will be determined by the completeness of answer and neatness of presentation.

- - - - -

> In a very real sense, the secretary is a communicator. Whether by letter, by phone, or in person, she represents her immediate superior and the company. The secretary must be sure that what she communicates is accurate as to facts, clear as to form, pleasant as to tone, and, most important, understandable to the recipient.
>
> Dallas Shenk, CPS

Private Secretary's Encyclopedic Dictionary, Besse May Miller, Prentice-Hall, Inc., Englewood Cliffs, New Jersey 1962.

Follow the instructions step by step to complete this unit. You may use any of the reference books listed.

A. MEETING THE PUBLIC IN PERSON

There is no magic formula for greeting visitors, other than courtesy, attentiveness, and tact. Your employer places a great deal of importance on maintaining effective public relations because it develops goodwill for the company. Goodwill is good business. One of the most important duties you will perform as a secretary is that of acting as a receptionist. You will find in your work as a receptionist that each person is different from every other person and that you will be meeting many types of people.

There will be quiet ones and noisy ones, shy ones and agressive ones, uncertain ones and certain ones who approach your desk for information, advice, entrance to your employer's office, or for a number of other purposes. You will need to receive them all with the graciousness that will put each of them at ease and will allow you to act responsibly in your position as receptionist. (Secretarial Office Practice, Seventh Edition, page 245)

Assignments:

On the following assignments, unless otherwise directed, type the question first and then the answer. You may set them up in any style you want. These assignments can be used as reference material for you later.

1. Read Unit 9, page 203, Applied Secretarial Practice, Sixth Edition.

16339

2. Turn to page 215, Applied Secretarial Practice, Sixth Edition, and complete Probelm #3, using an appointment form. This should be done in handwriting.

3. Turn to page 214, Applied Secretarial Practice, Sixth Edition, and complete Problem #1.

4. Turn to page 255, Secretarial Office Practice, Seventh Edition, and answer the five questions under "What Do You Think?"

B. MEETING THE PUBLIC BY TELEPHONE

Every time you pick up the phone, your public relations are showing. Make the most of this opportunity to create goodwill for your company, your employer, and yourself. You will be called upon to make and answer all types of telephone calls. The effectiveness of each of your calls, to a large extent, depends upon how well your callers understand you. Therefore, it is essential that you understand the proper techniques for using the telephone in every business situation. (Secretarial Office Practice, Seventh Edition, page 211)

Assignments:

1. Read Unit 7, Part 1, pages 211-229 in Secretarial Office Practice.

2. Turn to page 230, Secretarial Office Practice, and answer Problems 1, 2, 3, and 5 under "What Do You Think?"

3. In the same book, page 230, read the situation listed under "Your Personal Qualities" and answer the questions following it.

4. In the same book, page 231, complete the Problems 1 and 2 under "Secretarial Work."

5. Using telephone message forms, complete the problems at page 232 in the same book.

6. Type the following telephone tips to be used for future reference.

   a. Always hand up promptly when your business is finished.

   b. Be sure your boss is available when you are placing a call for him.

   c. In placing a call, if you find the person called is not available, ask when you may call back.

   d. Check the difference in time when you wish to place a long distance call. Remember to take daylight-saving time into account, too.

   e. Give your area code as part of your telephone number to people in distant cities.

16340

f. Keep a record of collect calls that you accept if such is needed to substantiate phone charges for your employer.

g. Investigate the toll credit card for your boss's use if he travels much.

h. When answering a person-to-person long distance call for someone else, always note the operator's number, city and state, telephone number, and name of the party and/or his extension number if given.

i. If you reach a wrong number after dialing an out-of-town call, ask the name of the city and state you reached by mistake. Report this information promptly to the operator so that you won't be billed for the call.

j. If you are responsible for ordering stationery or other printed material for your firm, it is useful to have the area code as well as your telephone number shown on the stationery.

7. Obtain a tape from your teacher and record your voice by reading a prepared script. After completing the tape, play it back so that you can analyze the quality of your voice. A check list including the following characteristics will be used for this analysis: tone, clarity, enunciation, volume, and inflection.

C. MEETING THE PUBLIC BY LETTER

As a secretary, one of your responsibilities will be to write many of the routine letters for your employer. Each letter that you compose should be a commendable example of the kind of work that you do. You must remember that they are important for they frequently deal with details that are critical. Above all, you will want to communicate the message in a complete and gracious fashion, accomplishing the purpose of the letter.

Assignments:

1. Read Unit 10, pages 212-230, Applied Secretarial Practice, Fifth Edition.

2. Complete #1 under "Job Experience Projects" in Applied Secretarial Practice Fifth Edition. Type this letter in the style of your choice. This is on page 231-232.

3. Complete #2, under "Job Experience Projects: in the above book, page 232.

4. Complete #5, page 232, in the above book.

5. Turn to page 105 in the Secretary at Work. Assume you are working for Mr. Frank X. Cartwright and answer the letters according to the notations he has made. These letters are to be typed for his signature. Use modified block style with blocked paragraphs and mixed punctuation.

6. At the completion of this unit, hand your papers to the teacher for checking. She will give you the next unit (Filing) in this course.

FILING

BEHAVIORAL OBJECTIVE:

At the conclusion of this unit you will be able to apply the basic rules of filing by indexing, coding, and filing various jobs as given in the filing workbook. Three tests will be given which will involve indexing, coding, and filing names similar to those in the workbook exercises. At least 90% accuracy will be required to pass these tests.

- - - - -

Although many large firms have a central filing department, you will have to maintain certain files in your department for your employer's convenience and your own. A thorough knowledge of basic filing principles will help you in getting correspondence and other information from the files. This is an important part of your daily procedure. You must be able to locate material immediately when it is needed.

Text: Filing Practice Workbook, Second Edition, Pitman Publishing Corporation, New York, New York 1958.

Assignments:

1. Obtain a filing practice workbook from your teacher. This book will be for your own use. Tape the pocket on the last page as instructed on that page so that you will have a place to keep your filing slips.

Do not tear out filing slips until you reach the specific job. When you separate the slips, keep them together by placing a rubber band around the slips for each job.

Use a shorthand notebook (one that is not used in your shorthand class) to record each filing job. Write your name at the top of each page and indicate the job number. You may use both sides of the paper.

A key is available for you to use in checking each job as you complete it. Be sure you return the key to the proper shelf when you have completed checking a job so that other students may use it. Do not write in the key and do not lose it. If you do not understand the order of some of the filing slips as recorded in the key, be sure to check with your teacher. Do not proceed to the next job until you are sure you understand the rule covered in the job you have just completed.

2. Read carefully the material on the back of the front cover.

3. Read and study the rule and example for filing Job #1. Follow the directions given and record the order of your slips by copying the coded numbers of the slips in your shorthand notebook. After recording the order of the slips, check your answers with the key.

16343

Be sure that you code each item. Coding is a prerequisite to accuracy in filing. Use a red pencil to do your coding. If the primary index unit is an abbreviated one, it should be spelled out in red pencil.

4. Continue with Jobs #2 through 12, following the same procedure as given in Assignment 3. Be sure you complete each job and check it before going to the next job. Include all optional jobs.

5. After completing Job #12, tear the pages from your shorthand notebook that have the jobs recorded on them and give them to your teacher. She will give you a test covering Jobs #1 through 12.

6. If you were able to attain at least 90% on the test, you may continue with the next assignment.

7. Complete Jobs #13 through 26, following the same procedure as given in Assignment 3. Include all optional jobs.

8. After completing Jobs #13 through 26, tear these pages from your shorthand notebook and give them to your teacher. She will give you a test covering all the material you have completed in this unit.

9. If you were able to pass this test with at least 90% accuracy, you may proceed with the next assignment.

10. Read the material on the inside of the back cover covering geographic and numeric filing.

11. Complete Optional Filing Jobs 27A, 28A, and 29A, following the same procedure as given in Assignment 3.

12. Complete Optional Filing Jobs 30B, 31B, and 32B.

13. After completing Assignments 11 and 12, hand them to your teacher. She will give you a test that reviews all the rules of alphabetic filing.

14. If you were able to attain at least 90% accuracy on the test, your teacher will give you the next unit. (Mail Services)

UNIT V

MAIL SERVICE

Behavioral Objective:

At the conclusion of this unit the student should be able to classify mail and figure the cost of postage.

Given specific assignments, the student will be able to identify the proper handling of office mail. Eighty-five percent accuracy on each assignment will be required to successfully complete this unit. No test will be given.

Text:

Applied Secretarial Practice, Fifth Edition; Gregg, Fries, Rowe, Travis; McGraw-Hill Book Company, New York, 1962.

Assignments:

1. Read pages 179 to 192, Applied Secretarial Practice. Read this material carefully as you will have to know the information given to complete your assignments.

2. Complete the attached sheet, "Classification of Mail." In the space provided, give the type of classification necessary for the listed item. (Refer to your text and Postal Guide on the reference shelf.)

3. Complete the following problem. Use a sheet of type paper and type your name in the upper left corner. Use "Cost of Postage" for the heading. In these problems use the current postal rates, which may be secured from the latest issue of the Postal Guide which is available on the reference shelf.

   a. On January 15, Weber High mailed the following items to out-of-town addresses. List each item separately and find the total cost of postage:

      18 letters, each weighing 1 ounce
      2 letters, each weighing 1 1/8 ounces
      5 letters, each weighing 2 ounces
      3 letters, each weighing 1 ½ ounces, special delivery
      6 letters, each weighing 2 ½ ounces, special delivery
      7 letters, each weighing 2 ¼ ounces, airmail
      2 letters, each weighing 1 ounce, airmail, special delivery
      1 package, first class, weighing 4 pounds, to be mailed to a city in the third zone

4 parcel-post packages, weighing 4 pounds, to be mailed to the fourth zone
1 parcel-post package, weighing 4 ½ pounds, to be sent 175 miles marked "Special Handling"

b. On January 16, the Karmelkorn Shop in Ogden, Utah, mailed the following items to local and out-of-town addresses. List each item separately and find the total cost of postage:

Out-of-Town Mail

40 letters, each weighing 1 ounce
3 letters, each weighing 2 ounces, arimail
25 circulars, each weighing 2 ½ ounces
5 parcel-post packages, each weighing 2 pounds, addressed to cities in second zone
2 parcel-post packages, each weighing 3 ½ pounds, addressed to a city 149 miles from the company.
6 boxes, each weighing 5 pounds, shipped to the seventh zone, marked "Special Handling"

Local Mail

23 letters, each weighing 1 ounce
3 letters, each weighing 4 ounces
4 letters, each weighing 1 ounce, special delivery
34 circulars, each weighing 2 ½ ounces
4 parcel-post packages, each weighing 3 pounds

4. Hand your completed assignments to your teacher, and you will be given the next unit (Practice Set) in this course.

Assignment

WS. 1. Rectangles; Complete the rectangles on the Work Sheet shown at the right of the samples by sketching freehand lines like those shown in the samples. Do not use a straightedge for drawing lines. This work is to be done freehand. Solid sketching lines may be used instead of broken lines if you prefer. Write your name and hour in the title strip. Do not letter Work Sheets 1, 2, 3, or 4. Have your drawing checked.

WS. 2. Two-view Sketches; The views shown are two-view drawings of three different objects. Notice that the end view of the bottom object shows invisible edge lines. In the space to the right of the objects, make freehand sketches like those shown in the samples. Write your name and hour in the title strip. Have your drawing checked.

WS. 3. Circles and Arcs; In the space below the objects, make freehand sketches like the samples. Notice that the outline of the object is dark and the blocking-in (construction) lines are light. Write your name and hour in the title strip. Have your drawing checked.

WS. 4. Rounds and Ovals; In the space to the right of the objects shown, make freehand sketches like the samples. These objects have both straight and curved lines. Be sure your construction lines are light. Write your name in the title strip. Have your drawing checked. Arrange your first four sketches in numerical order with number 1 on top and turn them in to be graded.

Classifications of Mail

1. Package (4 pounds) _____
2. Look Magazine _____
3. Postal card _____
4. Blue Spruce Tree _____
5. Circular _____
6. Birthday Cards _____
7. Carton (75 pounds) _____
8. Business reply card _____
9. Sample box of Dash Soap _____
10. Typed letter _____
11. January White Sale Advertisement _____
12. Longhand report _____
13. Interoffice memorandum to a branch office _____
14. Merchandise sample (4 ounces) _____
15. Air Card _____
16. Double post card _____
17. Catalogue _____
18. Newspaper _____
19. Baby Chickens _____
20. Seeds _____

16347

UNIT VI

PRACTICE SET
(Secretary on the Job)

BEHAVIORAL OBJECTIVE:

The student will demonstrate her secretarial skills by completing a practice set which offers a useful and realistic orientation for a secretarial job. Ten points will be given for each assignment; six points are required to pass an assignment. No test will be given.

Text:

The Secretary On The Job (Practice Set), by Mary Witherow, McGraw-Hill Book Company, New York, New York, 1967.

Supplementary Instructions for the Student:

Source Material, pages 1 through 30 of the 65-page booklet, contains the notes and correspondence you will have to refer to in order to complete some of the assignments. The second half of the booklet, the Working Papers, consists of business forms to be filled out and handed in for checking.

The memorandum from Helen Jefferson, Source Material pages 3 through 5, contains information on procedures, which you will refer to throughout the practice set. You must follow the procedures outlined so you should study the memo carefully.

The material to be dictated throughout the set is on tape. When you need the dictation, ask your teacher for the tape for the job you need.

When an assignment requires that a letter or memorandum be typed on a stencil or spirit duplication master, the copies should be run off on plain paper. Stationery is provided for originals of correspondence only.

For duplicated memoranda, you should type the necessary headings at the top of each memo master using some acceptable arrangement of TO, FROM, SUBJECT, and DATE.

There are not enough envelopes in your working papers to cover all of the assignments in your practice set. However, an envelope must be typed for each letter. When you are not instructed to use the envelopes in your set, address an envelope on the back of your letter. Remember: some kind of envelope must be included or points will be deducted.

16348

Hand in your work after completing Jobs 5, 10, 15, 20, and 28. Be sure to keep your material in the proper folders--chronological file or signature file. All of your material will be returned to you at the completion of the unit.

Job #1

You may use any style you wish for your Resume. Refer to the secretarial books on the reference shelf for suggestions on the form to use.

Be sure to list complete address and phone numbers for all references. Résumé is correct with two acute-accented e's or with no accents at all (Resume). Resumé with only the final e accented is not correct.

Job #2

The memo to Mr. Joseph Dickinson should be typed on a Stover memo form.

The memo to Field Sales Managers should be duplicated on plain paper.

Job #8

The company names, capitalized in the list, should be typed in the upper and lower case in the letters, and the addresses should not contain abbreviations.

Job #13

The secretary must know the class of service that her employer prefers or her company specifies. Many firms require that all but their top officers fly coach; others want their executives to fly first class only. Sometimes, of course, these regulations must give way to expediency. Whichever class you choose for Mr. Wilson's flight, the price of the ticket should be correct for that service.

In some cities there is more than one airport serving commercial passenger planes. In this case, there is no choice. St. Louis has only Lambert Field, and O'Hare is the only airfield in Chicago used for this purpose.

You must remember to allow Mr. Wilson ample time to reach the Palmer House and have enough time to check in and have lunch before his 2:30 meeting time. You also must give him time to allow for delays.

235 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

In the winter, weather conditions are uncertain and so you must allow for delays, also.

On his return trip you must allow Mr. Wilson time for the luncheon engagement listed among his appointments and that gets him into St. Louis in time to reach his office Friday afternoon.

The telegrams you write should include all the information mentioned in the assignment.

Job #14

You should not give out too much information during your employer's absences. In the letter to Mr. Myers, you should not mention the date of Mr. Wilson's return to the office. You should protect your employer from unnecessary interruptions, such as calls from suppliers, on what would normally be a very busy day.

Job #17

The petty cash statement and check should be done in ink--not on the typewriter.

If you are not sure how to do these items, check with some of the books on the reference shelves.

Job #19

You should record under Entertainment expenses for meals at which the executive entertains business associates. The cost of his own meals on business trips, when he is not involved with business entertainment, are entered under the heading Meals.

When dates for entries are unspecified, enter the expenses at the beginning or end of the report.

Remember that the sum of the vertical totals should equal the sum of the horizontal totals.

NOTE: An error in the first printing of the text-kit, SM21, has 2/6 for item 5; this should be 1/6.

Job #25

The checks in this job may be typed or handwritten.

At the successful completion of this practice set, a letter grade and one-half credit will be awarded.

UNIT VI

PRACTICE SET
(Typewriting Office Practice)

BEHAVIORAL OBJECTIVE:

The student will demonstrate her clerical office typewriting skills by completing a practice set which offers a useful and realistic orientation for a clerical office typewriting position. Ten points will be given for each assignment; six points are required to pass an assignment. No test will be given.

Text:

Typewriting Office Practice, Fourth Edition (Practice Set) by Peter L. Agnew and Phillip S. Atkinson, South-Western Publishing Company, Cincinnati, Ohio, 1968.

Supplementary Instructions for the Student:

1. Write your name on the envelope of your practice set where indicated.

2. Write your name on the front of each folder that is inside your practice set. This will identify your work and prevent loss of your material. If your practice set is lost, you will be required to purchase a new one.

3. Read pages i and ii of your instruction manual carefully. These instructions will help you throughout the practice set.

4. Each job gives you specific instructions--FOLLOW THEM CAREFULLY.

5. After completing each job, hand it to your teacher in Folder 5.

6. If at any time you do not understand the job on which you are working, please check with your teacher for additional help.

7. BE CAREFUL WITH YOUR MATERIAL. The only papers available for this course are in your practice set.

16351

PART TWO

OFFICE MACHINES

16352

OFFICE MACHINES

BEHAVIORAL OBJECTIVE:

At the completion of this course the student will be able to perform all of the basic mathematical functions associated with the operation of the Ten-Key Adding and Printing Calculators and the Electronic Calculators according to the standards set up in the individual unit.

The student will also be able to perform the operation of the keypunch machine and have a basic understanding of processing data both manually and electronically according to the standards set up in the individual unit.

The following units will be included in this course:

Unit I Ten-Key Adding and Printing Calculators, Electronic Calculators
Unit II Data Processing (Keypunch)

After the successful completion of the above units, one-fourth credit and letter grade will be awarded.

16353

UNIT I

10-KEY ADDING AND PRINTING CALCULATORS,
ELECTRONIC CALCULATOR

BEHAVIORAL OBJECTIVE:

At the completion of this unit the student will be able to perform all of the basic mathematical functions associated with the operation of the 10-Key Adding and Printing Calculator. The student must attain a speed of 100 net strokes per minute and a production test of method and accuracy must be completed with a minimum of 75 per cent.

The Electronic Calculator will be used for part of the production solving problems and no test will be given on this machine.

Texts:

1. Office Machines Course, Third Edition; Agnew and Cornelia; South-Western Publishing Company; Cincinnati, 1962.

2. Ten-Key and Printing Calculators, Third Edition; Agnew and Pasewark; South-Western Publishing Company; Cincinnati, 1963.

3. Rotary Calculator Course, Fourth Edition; Agnew and Pasewark, South-Western Publishing Company, 1962.

General Instructions:

Each day as you enter the room, pick up the text from the storage cabinet. If answer sheets are needed, pick them up at the same time. Fill in all blanks on each answer sheet completely, numbering the assignment, job, and practice numbers.

Clear your desk or table of books and papers that do not pertain to the course. Place the machine to the right of your desk or table, at a slight right angle, and the book at the left. Keep your personal belongings away from the machines.

Position the machine and book to give you ease of operation and reading.

Sit erect, relax, and put both feet flat on the floor.

Place the first, second, and third fingers on the middle bank of keys--the keys 4, 5, and 6.

Clear the machine by depressing the total button. Always be sure your machine is clear before starting to work a problem.

16354

Assignments:

1. When you have a clear machine, turn to page 25 of the text (Office Machines Course) and add each problem in Job 11, page 23, two times. Record your answer on the sheet provided. As you add, do not look at the keys, concentrate on the problem. When completed and double checked, go to the next assignment.

2. Complete all of the problems in Job 12, page 29, except the Timed Drill. Add each problem 2 times.

   The use of the Non-Add key is introduced. When N appears by a number, depress the Non-Add key on your machine. This key is coded with the following symbols: #, N, or .

3. Complete all of the Problems in Job 13, page 31-32. In This job you will learn the use of the repeat key to repeat whole numbers or to repeat numbers by columns in order to multiply. Read the overview and Procedure on page 31.

   If the machine on which you are working is not covered by the procedure given or you do not understand, check with your teacher for assistance.

4. Complete all of the problems in Job 14, page 33 and 34, including Timed Drills. This is a review of previous functions.

5. Complete Job 15, page 35 and 36, including the Timed Drill. Always be sure your machine is clear.

   To subtract, enter minuend (top number) in machine and depress + bar. Enter sbutrahend (bottom number) in keys and depress minus key. Take total.

   Note: The minus key can be used to correct errors. If the wrong number has been printed, re-enter that number and subtract. Then enter correct number.

6. Complete Job 16, pages 37 and 38, including the Timed Drill. Sometimes it is necessary to get subtotals on problems. When an S appears by a total space, depress sub-total key instead of total. This causes the machine to print a total of the figures in the machine but does not clear the machine. Any figures entered after the sub-total key is marked with an S, ST, or , and the same symbol will appear on the tape.

7. Complete all problems in Job 17, pages 39 and 40, including the Timed Drill.

WS. 5. Lettering: On page 11 you will find an Illustration Sheet on lettering. Notice that the numbers show the order for making the strokes, and the arrows show the direction of strokes used in forming the letters. The width and proportion of the letters are also shown. Letter the lines below the samples. Also fill in the extra practice spaces. The title strip is also to be lettered, not written. Illustration Sheet 3, page 13, gives help for making title strips. Use all capitals and use light guide lines for keeping your letters neat and uniform in height. Have your Work Sheet checked and graded.

WS. 6. Dimensioning: Complete the Work Sheet by following the samples shown. The title strip is to be lettered in, using guide lines for keeping the letters uniform in height. Have your Work Sheet checked and graded.

1633

When the subtrahend is larger than the minuend, the resluting total will be a credit balance. All of your machines will give an automatic credit balance, indicated with the following symbols: cr or *. When you record your answer, indicate the credit balance with cr written after the answer.

8. A ten-key adding machine will not divide without special manipulation. To divide you must multiply. This is done by converting the divisor to a reciprocal (given in charts on page 41) and multiplying the reciprocal times the multiplicand. (The multiplicand is the top number of your problem.) CAUTION: If there are decimals in the problem, then there will be decimals in the answer. If there are no decimals in the problem, then there cannot be a decimal in the answer. If the machine you are using prints a decimal, this is for convenience in adding dollars and cents only, and must be ignored any other time.

   Complete all of the problems in Job 18, page 41, 42, and 43. Do not do the Timed Drill.

   NOTE: In completing problems 21 - 40, use only 5 places in the reciprocal instead of the 8 given. Cross off the last three places.

9. Complete Job 19, pages 45 and 46, including Timed Drill. Job 19 contains a problem in vertical and horizontal addition. Add each vertical column at least twice. As you record your answers, mark them with a V. If you obtain the same answer twice, you can be reasonably sure it is correct. After all the columns have been added vertically, add across the lines horizontally, again two times or more using the same procedure as before, and marking totals with an H.

   When all of the totaling is complete and double-checked, add all of the vertical totals to obtain a grand total. Also, add all of the horizontal totals and obtain a grand total. This grand total from both sources must agree. If it does not, again check all of your addition until it does.

10. This job is a review of all of the operating principles covered, It is an excellent preparation for the tests to be given when you are ready. Complete the problems in Job 20, pages 47 and 48, for practice twice. If there is any problem you do not understand clearly, ask your teacher for help and be sure you do understand before you complete the job.

11. At this point you will take a production test of method and accuracy. A minimum of 75 % accuracy is required. If you do not pass this test, you must review and take another test.

12. Obtain a drill book from your teacher. Practice addition problems consisting of three or more digits. When you feel you can pass the speed tests with the required 100 net strokes per minute, ask your teacher for the test.

13. The following problems will apply the methods you have learned to actual business problems and forms. For these problems you will use the text, 10-Key adding and Printing Calculator Course (Gray Book).

14. Complete Problem 13 of Job 6 on page 23. Follow very carefully the instructions given.

15. Complete Problems 38 to 42 of Job 12 on page 43. Follow the instructions carefully.

16. Complete Problems 16 to 24 of Job 14 on page 51. Follow the instructions carefully.

17. Complete Problems 6 to 11 of Job 16 on page 57 and Problems 28 to 35 of Job 16 on page 59.

18. Complete Problems 17 and 18 of Job 22 on page 79. Follow the instructions carefully.

19. Complete Problems 1 to 6 of Job 23 on page 81.

20. Complete Problems 6 to 15 of Job 24 on page 86.

21. Complete Problems 11 to 31 of Job 27 on page 98. Use the 1968 percentage for FICA.

22. The following assignments will be completed on an electronic calculator. For these problems you will use the text, Rotary Calculator Course, (Blue Book).

23. Complete Problems 21 to 36 of Job 3 on page 11.

24. Complete Problems 11 to 26 of Job 7 on page 24.

25. Complete Problems 31 to 43 of Job 8 on page 29.

26. Complete Problems 31 to 41 of Job 11 on page 35.

27. Complete Problems 31 to 46 of Job 13 on page 43.

28. Complete Problems 16 to 30 of Job 17 on page 56.

29. You have now completed Unit I of this course. Check with your teacher, and you will be given Unit II (Data Processing).

NOTE: If you are interested in receiving further instruction on office machines (rotary calculator and key-driven machines) you may complete an additional course. This course will take seven to nine weeks and an additional one-fourth credit will be awarded.

UNIT II

DATA PROCESSING (KEYPUNCH)

BEHAVIORAL OBJECTIVE:

The student will demonstrate his understanding of the processes of the keypunch machine by completing four tests given throughout the unit. At the completion of this unit the student will be able to perform the operation of the keypunch machine by completing actual problems on the machine. The tests given must be passed with a minimum of 75% accuracy.

Text: Data Processing, Volume I; Ray W. Hass; 3M Education Press, St. Paul Minnesota, 1966.

Data Processing Illustrations, Volume I-III; Ray W. Hass, 3M Education Press; St. Paul, Minnesota, 1966.

Assignments:

1. Obtain the above two texts from your teacher as you enter the class each day. These are not to be taken from the room at any time.

2. At this point a test will be given to you, covering the material you have read so far.

   If you complete this test with 75% accuracy, proceed to the next assignment.

3. From this point on all answers to the programmed questions must be written in an organized notebook.

   Be sure you identify your answers properly, using correct titles and question numbers.

   This notebook must be handed in at the end of this unit.

   Read page i of the Card Format Section very carefully. If you make an incorrect response, cross out your answer in your notebook, review the material you have just read, and write the correct answer in your notebook.

   NOTE: Be as neat as possible in organizing your notebook, but crossed-out answers are expected and will not lower your grade.

4. Begin using your notebook and read and answer the questions on page ii to v.

5. Proceed at your own rate, using the above directions and complete the questions on pages 1 through 19.

6. At this point a test will be given to you covering the material you have just completed. If you have completed this test with at least 75 per cent accuracy, proceed to the next assignment.

7. Complete the questions on pages 21 through 47.

8. At this point a test will be given to you covering the material you have just completed. If you complete this test with at least 75 percent accuracy, proceed to the next assignment.

9. Turn to page 2 of the Keypunch Machine Section of the textbook. Complete all the problems on page 2 through 43.

10. At this point a test will be given to you covering the material you have just completed. If you complete this test with 75% accuracy, proceed to the next assignment.

11. Check with your teacher. She will give you some practice problems to be completed on the keypunch machine and assist you in the operation of the machine.

12. When you have satisfactorily completed the problems on the keypunch machine, you will be awarded a letter grade and one-fourth credit for this course.

NOTE: If you are interested in receiving further instruction and practice on the keypunch machine, you may complete an additional course on keypunch operation. (This course will take seven to nine weeks and an additional one-fourth credit will be awarded.)

PART THREE

TRANSCRIBING AND DUPLICATING MACHINES

16361

TRANSCRIBING AND DUPLICATING MACHINES

BEHAVIORAL OBJECTIVE:

At the conclusion of this unit the student will be able to operate a transcribing machine efficiently by setting up dictated letters and memorandums in mailable form and other dictated material in manuscript form according to the standards set up in the individual unit.

The student should be able to prepare spirit duplicating masters, offset masters, and cut stencils for the mimeograph. The student will also be able to operate the spirit duplicating machine, the stencil duplicating machine, copying machines, and the illuminated drawing board according to the standards set up in the unit.

The following units will be included in this course:

Unit I Transcribing Machines
Unit II Duplicating Machines

At the successful completion of the above two units, one-fourth credit and a letter grade will be awarded.

16362

UNIT I

TRANSCRIBING MACHINES

BEHAVIORAL OBJECTIVE:

The student will be able to complete various assignments on the transcribing machine. Lesson 4 will be given 90 points; Lesson 8, 80 points; Lesson 9, 60 points; Lesson 13, 80 points; and Lesson 19, 80 points. A minimum of 75 per cent accuracy will be required. At the completion of the above lessons, you will be given one class period for a test. Ten points per page will be given with one point deducted for each error.

- - -

To improve efficiency in the use of the executive's time and the secretary's, a wide variety of recording and transcribing equipment has been introduced into the business office. Your boss, for example, may dictate many of his reports while he travels by using a small portable dictating unit. You may have an employer who uses dictating equipment much of the time or as a supplementary aid when he must work after regular hours. It is important, therefore, that you be acquainted with the operating principles of transcribing machines.

Text: IBM Executary, Transcribing Techniques with IBM Executary Dictation Equipment, which includes student text and set of prerecorded belts; New York, New York.

Assignments:

1. Obtain the transcribing machine equipment and belts from the shelf and set up the equipment at a desk or table next to an electrical outlet.

   NOTE: At the end of each period you must remove the belt and index tab from the machine and place it in the proper container and return all equipment to its appropriate place on the shelf.

2. Obtain the IBM booklet, Transcribing Techniques, from the reference shelf. Also, obtain the small blue IBM brochure entitled "Easier Transcription with your new IBM Dictation Equipment" from the shelf.

3. a. Read Lesson 1 and follow the instructions. Also, read the brochure you obtained from the shelf. NOTE: Do not try to transcribe from the belts without first reading these instructions. Lesson 1 gives you step by step instructions and pictures as to how to set up your machine and type from a belt.

b. Lesson 1 is a practice belt. Remember: Type more slowly than you normally type. Try to be accurate but do not stop and correct errors when you make them.

c. Because this is a practice belt, you may type on both sides of your paper. Use manuscript form for this lesson. Type your name and the belt number in the upper left corner of the first page of your lesson transcription. After you have completed the transcription of Lesson 1, place all the papers in order, staple them together in the upper left corner, and hand them to your teacher before proceeding to the next lesson.

4. a. Read and follow instructions given in Lesson 2.

b. This is also a practice belt so you may use both sides of your paper. You do <u>not</u> have to correct errors.

c. Use manuscript form.

d. Follow the instructions given in 3c.

5. a. Read and follow instructions given in Lesson 3.

b. This is your last practice belt. Use both sides of the paper. You do not have to correct errors.

c. Set the letters up in full-block style and use manuscript form for the other material given.

d. In the inside address for each letter a zone number will be dictated. Omit this number and add a zip code. This should be done on all letters typed in this entire unit.

e. Type your name and the belt number in the upper left corner of the first page of transcription.

f. Put your papers in order, staple them together, and hand them to your teacher before proceeding to the next belt.

6. a. From this point on the material in <u>all</u> lessons should be set up as <u>mailable</u> transcripts.

b. <u>All</u> errors should be corrected.

c. Use only one side of your paper.

d. Paragraphs should be set up in unbound manuscript form.

e. Letters should be mailable. You may use the letter style of your choice. Use the current date on your letters, and remember to add zip codes and omit the zone numbers.

f. The material must be typed directly as a final copy. Do not type it as a rough draft and then retype it as a final copy. The goal of this course is for continuous, accurate typing directly from dictation.

g. As each belt is completed, put your papers in order, staple them together, and hand them to your teacher before you proceed to the next belt.

h. Be sure you have your name and belt number on the first page before handing in your papers.

7. Transcribe all material on Belt No. 4. Do not follow the book directions. You do not have to make carbon copies for the letters on this belt but be alert for directions for carbon copies and enclosures mentioned and make the proper notations at the close of the letter. Be sure to follow the directions outlined in the preceding instruction.

8. Transcribe all material on Belt No. 8. Do not follow the book directions. For the letters you type on this belt, assume you are working for the Winslow Insurance Agency, 766 Main Street, Dearborn, Missouri. You are secretary to the president of the company, Mr. Frank H. Winslow. Follow instructions given in assignment 6. No carbons are necessary but make correct notations.

9. Transcribe all material on Belt No. 9. Do not follow the book directions. On this belt you will hear a woman's voice, but you are still to assume you are working for the president of the company, Mr. Frank H. Winslow. No carbons are necessary but continue to make the correct notations where necessary. Follow the steps outlined in assignment 6. Be sure to be a good proofreader and correct all errors.

10. Transcribe all material on Belt No. 13. Do not follow the book directions. On this belt you are working for Carl B. Long, Station Manager. Make a carbon copy for each of the letters on this belt.

Sometimes the person dictating occasionally makes grammatical errors because he is concentrating more on the message than the form. It is the typist's responsibility to be alert and correct any error made by the dictator. On Belt No. 13 there is one grammatical error and one dictation error which you should correct. Remember: Before you begin to transcribe, be sure to check the Index Tab and find out the point where the dictator instructs you to make a correction. As you approach this point, stop typing and listen ahead for the error and its correction so you won't type the wrong words and have to erase.

UNIT II — CHARTS, MAPS, AND GRAPHS

General Information

Diagrams, Charts, and Graphs:

Have you ever heard the old proverb, "One picture is worth a thousand words"? A picture, chart, map, or graph can be used to explain things clearly and quickly. They save using many words.

Diagrams, charts, and graphs are frequently used in magazines, books, and newspapers. They can present certain kinds of facts more clearly and quickly, using less space.

There are many kinds of graphs. Some common ones are line graphs, bar graphs, and circle graphs. They are all used to give a quick, clear view of related facts.

Maps:

Maps are used to establish the boundaries of national, public or private properties; to locate or describe the physical features within these boundaries; and to direct the courses of travelers on land, on the sea, or in the air.

The information from which various kinds of maps are drawn is called field data. The branch of civil engineering that has to do with gathering these data is known as surveying. The map draftsman works from the surveyor's data and field notes, or from aerial photographs.

Maps of small areas of the earth's surface, such as states, counties or cities may be thought of as top views, giving an out-

11. Transcribe all material on Belt No. 19. Do not follow the book directions. No carbons are required. Correct any errors you hear.

    Sometimes when a boss is dictating he is reminded of other duties that need to be done. He, therefore, might dictate these instructions on the belt to his secretary. The secretary should type up these directions so that she will have a written reminder and will not forget them

    On Belt No. 19 you are working for Mr. Joseph C. Newman, Assistant Manager. He will give you some instructions as to some duties you should perform. Type up the special directions, but you do not have to carry out the instructions.

12. If you have successfully completed the above assignments, you will be given a test belt to transcribe. You will be given one class period for this test. Ten points per page will be given with one point deducted for each error.

UNIT II

DUPLICATING MACHINES

BEHAVIORAL OBJECTIVES

At the conclusion of this unit the student will be able to prepare spirit duplicating masters, offset masters, and cut stencils for the mimeograph. The student will also be able to operate the spirit duplicating machine, the stencil duplicating machine, copying machines, and the illuminated drawing board. Evaluation will be on the following:

1. A written test will be given on the preparation of a master sheet and a written test will be given on the preparation of stencils. Eighty per cent accuracy will be required to pass these tests.

2. All duplicating assignments will be graded. They will be judged on neatness, placement, sharpness, and originality. Ten points will be given for each assignment. Eight points are required to pass.

20th Century Typewriting, Eighth Edition, Lessenberry, Crawford, Erickson, Southwestern Publishing Company, Cincinnati, 1962.

A Guide to Duplicating and Copying Processes, Olga B. Brown, Weber State College, 1969.

- - -

When only a few copies of an item are involved, carbon copies are an effective and inexpensive means of reproduction. When many copies of manuscripts, schedules, policy statements, memorandums, personnel bulletins, and other company news are needed, duplicating equipment is used for this purpose.

It is your responsibility to determine which type of duplicating process to use. After reading and completing the assignments in this unit, you will know the advantages and disadvantages of each process.

16367

Assignments:

Stencil Duplicating and Illuminated Drawing Board

1. Read Section 4, pages 352-356 in Applied Secretarial Practice, Sixth Edition. Read these pages carefully because you will be tested on this material. Check with your teacher if you have any questions. (Addition information may be found in Secretarial Office Practice, Seventh Edition, Pages 366-383.)

2. Obtain a test from your teacher. Follow directions carefully. When you have completed this test, hand it to your teacher for checking. If you have obtained at least 80 percent accuracy on the test, you will proceed to the next assignment.

3. Obtain a stencil from your teacher. With the use of the illuminated drawing board, prepare the stencil by illustrating various types of letter styles. Use the different lettering guides and styli available (see page 356). You may use any words you wish. This is a practice stencil.

   You should also use the shading screens in at least one letter style. Sign your name in the lower right corner of the stencil. You will be using a regular 8 1/2" x 11" paper so do not go beyond the horizontal line indicating this size paper on your stencil. When you have completed this stencil, hand it to your teacher. When all stencil assignments are complete, you will be shown how to run them off on the stencil duplicating machine. Five copies of this stencil are required.

4. Obtain a stencil from your teacher. Prepare a stencil for announcing some type of an event or advertising some type of merchandise. Use both lettering guides and pictures. This should be complete as to "when", "where," and "what," Pictures that may be used as illustrations are available on the shelf, or you may use pictures from magazines, newspapers, etc. When you have completed this stencil, hand it to your teacher. Five copies of this stencil will be required.

5. Obtain a stencil from your teacher. Prepare a program for a fashion show, banquet, or a party. List the menu (if it is a dinner program), program, committee members, etc. Appropriate pictures should be used to make this program attractive and "eye catching." This is the type program that is folded four ways (French fold). Type a copy of what you want to reproduce on a regular sheet of paper before making the stencil. This will enable you to prepare your material correctly. Check the illustrations on the board. After you have completed this assignment, hand it to your teacher. Five copies of this stencil will be required.

6. Obtain a stencil from your teacher. Turn to page 326 in 20th Century Typewriting (Text). Type the form letter 253C. Do not follow the book instructions. Choose your own letter style. Read the following instructions before you begin:

   As you type this letter, you must not type the date or the inside address, but you must leave space for these items to be added after you run off your stencil.

   This is a form letter and various information has to be inserted in the letter as it is sent to different people. Therefore, there are also some other blank spaces that will have to be left when you type the body of the letter.

   Check the three problems to the right of the letter and under each item determine the longest one in the three problems. This will tell you how many blank spaces you will have to leave on your stencil for that particular item. Run ten copies of this stencil. You will then have to insert three of these forms in your typewriter and type the information in Problems 1, 2, and 3, page 326.

7. At this point you will be shown how to run your stencils on the duplicating machine. Hand in two copies of each stencil. One of the french fold programs should be folded and the other one left flat. Hand in the three copies of the form letter that has been completed. Put a paper clip on these papers to keep them together. Be sure your name is on them.

Spirit Duplicating

1. Read carefully Section 3, pages 348-351, in Applied Secretarial Practice, Sixth Edition. You will be tested on this material. If you have any questions, be sure to check with your teacher.

2. Obtain a test from your teacher. Follow directions. When you have completed the test, hand it to your teacher for checking. If you have obtained at least 80 per cent accuracy on this test, you will proceed to the next assignment.

3. Obtain a master sheet from your teacher. Make a multi-colored master. Use red, green, purple, blue, or black carbons. You must use at least three colors. (The colored carbons are available on the shelf.) You may use the illuminated drawing board for tracing pictures on to the master sheet with a light pencil outline, then copy the illustration using carbons. DO NOT TRACE DIRECTLY ON THE ILLUSTRATIONS YOU ARE COPYING WITH PENCIL OR PEN UNLESS THEY ARE YOUR OWN.

16369

Illustrations are available on the shelf for your use, or you may find your own pictures in magazines, newspapers, etc. You may make a bulletin, an announcement, an advertisement, or an illustration. Your page should be well balanced and should include typing and printing as well as illustrations (pictures).

When you have completed this master, check with your teacher. She will show you how to operate the spirit duplicating machine. Run 10 copies of this master.

4. Obtain two master sheets from your teacher. For this assignment you will make a folded program for a school, church, or community function. Take a sheet of type paper and fold it in half. Make a rough draft of your program on this sheet of paper. This will show you the placement necessary of the material on your master sheets.

   Two masters are necessary for one program because the paper must be run through the machine twice to get print on both sides. When typing the masters, be sure that you are typing on the right portion of it so that it will come out right on the paper. Be sure to check with your teacher before you type the master.

   When you have completed this assignment, run 10 copies of this master.

5. Hand in two copies of each master. One of the folded programs should be folded and the other one left flat. Put a paper clip on these papers to keep them together. Be sure your name is on them.

Offset

1. Read pages 46 to 53 in "A Guide to Duplicating and Copying Processes."

2. Obtain an offset paper master from your teacher. Reread instructions, "Preparing a Paper Master" one through seven starting on page 50 of the booklet before you prepare your master.

3. Type an exact copy of the attached sheet, "Success Calls for Special Qualities," on your offset paper master. Follow each step outlined in the booklet carefully.

   Center your name one inch from the bottom of the page.

4. Examples of offset reproductions are shown on the bulletin board.

5. After completing the master, hand it to your teacher. If an offset machine is available, you will be shown how to run off your master.

16370

Copying Machines

1. Read Unit 10, pages 351-363, in Secretarial Office Practice, Seventh Edition.

2. On a sheet of type paper, make a copy of a medium length letter. You may choose any letter and style from any of the reference books on the shelf. When you have completed this letter, your teacher will show you how to make a copy of it using a copying machine.

3. Turn to page 163 in Secretarial Office Practice, Seventh Edition. On a sheet of type paper, make an exact copy of the minutes illustrated. Substitute your name as secretary and sign your name in ink. When you have this completed, your teacher will show you how to make a spirit master from a copying machine.

   After you obtain the spirit master, run 10 copies on the spirit duplicating machine.

4. Hand in the one copy you made of your letter and two copies of the minutes from the spirit master. Put these papers together with a paper clip and be sure your name is on them.

After successfully completing Unit I and Unit II of this course, you will be awarded a letter grade and one-fourth credit.

16371

SUCCESS CALLS FOR SPECIAL QUALITIES

The girl who finds her greatest reward in being part of a team, rather than a solo star, shows the natural talent to work for and with others toward a joint goal that is essential to success as a secretary.

Loyalty, judgment, integrity and adaptability are high on the list of other requirements.

The girl who makes and keeps friends, and who sticks up for them and for her family at all times, shows the loyalty in word and deed that a secretary must bring to her boss and her company.

Can you accept sudden changes of plan amiably and without flurry? The secretary must be able to turn on a dime, occasionally, and work efficiently under heavy pressure when an emergency challenges her chief.

Are you accurate? Your boss must be able to rely with total confidence on your reports. Neatness, good spelling, and promptness in completing school papers show the respect for detail and the reliability needed by a secretary.

Are you adaptable? The secretary deals with all kinds of people. The girl who is liked by teachers and neighbors as well as by many fellow students shows the capacity to make her way in a big group--rather than stick with a clique--that is needed by the secretary.

Perhaps a prime requisite for success in the profession is approaching secretaryship as a chosen career--not as a stop-gap before marriage, or as a stepping stone to other positions.

The girl who does will gain experience in her working years that will serve her well, no matter what life brings, because she will have learned the secret of greatest happiness in all human relations; the more imaginatively, loyally and consistently she works for and with another person for his success, the more she benefits herself.

By Clare H. Jennings, CPS

16372

PART FOUR

BUSINESS ENGLISH

16373

BUSINESS ENGLISH

BEHAVIORAL OBJECTIVE:

At the conclusion of this course the student will be able to write business letters that will achieve the results desired. Practical letterwriting principles and techniques will be used pertaining to organization, completeness, clarity, conciseness, accuracy and similar aspects of written communications. The student will also be able to type these letters in "mailable" form. In order to attain this goal the student will be able to apply the fundamentals of practical English. He will be able to pass basic English tests with at least a 75% accuracy. These tests will involve the parts of speech and the rules of grammar which are the tools needed to construct a sentence, the basic unit of communication. Two spelling tests will be given (words will be taken from the words given in the worksheets). The student will be able to pass these spelling tests with at least 90% accuracy.

The student will also be able to locate information on a variety of topics quickly and accurately according to the standards set up in the "Sources of Information" unit.

The student will be able to improve his spelling and business vocabulary by developing special spelling techniques through the completion of assignments according to the standards set up in the "Spelling Improvement" unit.

The following units will be included in this course:

Unit I	Business English Essentials
Unit II	Sources of Information
Unit III	Spelling Improvement

After the successful completion of the above units, one-half credit and a letter grade will be awarded.

16374

UNIT I

BUSINESS ENGLISH ESSENTIALS

"English is for you a 'bread and butter' subject. In whatever position you find yourself after graduation, you will display your brand of English in letters and reports, in telephone conversations and personal conferences. Clear and accurate use of English can be the deciding factor in getting a good job, in being promoted to a position of responsibility, in making a sale, and in making a satisfactory adjustment with a customer.

The ability to speak and write well is an accomplishment well worth a considerable investment of time and effort." (Business English Practice, Pitman Publishing Corporation.)

- - - - -

Text: Business English Essentials, Third Edition by Greta LaFollette Henderson, Gregg Division, McGraw-Hill Book Company, New York, New York 1965.

The following parts will be included in this unit:

Part I Review of English Essentials
Part II English for Business Communications
Part III Punctuation for Business Letters
Part IV Writing the Business Letter

Directions:

Read page iv of your text carefully and take the pretest, "English Essentials Inventory." If you pass the pretest with 90% accuracy or better, you are to omit Part I of the Unit.

16375

line of the shape of the area and relative distances within it. The making of top-view maps is known as topographical drawing. Some maps give the elevations and irregularities of surface or area included and are known as relief maps and contour maps.

Symbols are devised to represent data on the map or chart. Some examples of symbols which may be used to represent facts are found on Illustration Sheet 4, page 19.

Using Topographical Maps:

An athletic field must be a level plot of ground which is well drained. However, some athletic fields are located where the original contour of the land is rather rough and it becomes necessary to grade down hills and make fills in order that a suitable plot may be obtained.

Much preliminary work must be done by the civil engineer or the surveyor before the grading and leveling process can take place. Preliminary grade drawings are made from data obtained by the surveyor. These drawings are then used by the grading contractor in the actual grading process.

When the grading is complete, both the track and the football field are layed out by the surveyor. These measurements must be very accurate since they must conform to the rules set up by the National Federation of State High School Athletic Associations. The curves on the track must be calculated together with the straightaway in order to determine a definite distance from a specific starting point. Illustration Sheet 5, page 21, shows one use of a topographical map. It shows the shape and size of a high school athletic field. What other facts can you figure out from this map?

PART I

REVIEW OF ENGLISH ESSENTIALS

BEHAVIORAL OBJECTIVE:

At the conclusion of this part, you will be able to use the tools of communications skillfully. You will be able to construct a grammatically complete sentence expressing the thought you wish to convey.

You should be able to complete Assignments 1 through 23 with at least 75% accuracy and pass a test on Part I with at least 75% accuracy.

Assignments:

1. Read and study the material under Topic 1, page 1 of your text.

2. Complete Worksheets 1, 2, and 3.

3. Hand Worksheets 1, 2, and 3 to your teacher to be checked.

4. If you were able to complete Worksheets 1, 2, and 3 with at least 75% accuracy, you should proceed to the next topic in your text.

5. If you were unable to reach 75% accuracy on the worksheets, you will be required to do supplemental work provided by your teacher before proceeding to the next topic. Check with your teacher for help. Do not try to go to the next step unless you understand the previous one.

6. Continue through Worksheet 23 using the steps outlined in Assignments 1, 2, 3, 4, and 5.

7. After successfully completing all of the assignments in Part I, you will be given a test on the fundamentals of grammar.

8. If you were able to pass the test on Part I with at least 75% accuracy, you may proceed to Part II.

9. If you were unable to reach 75% accuracy on the test for Part I, check with your teacher for additional help before proceeding to the next part.

16376

PART II

ENGLISH FOR BUSINESS COMMUNICATION

BEHAVIORAL OBJECTIVE:

At the conclusion of this part, you should be able to avoid common errors in language usage both in speech and in writing. You should be able to write so as to convey the meaning intended without the possibility of misunderstanding.

You should be able to complete Worksheets 24 through 63 with a minimum of 75% accuracy and pass a test on Part II with a minimum of 75% accuracy. This test will consist of words for which you are to supply the possessives (singular and plural), indentification of parts of speech in sentences, being able to use active and passive voice correctly, and the correct usage of words in a sentence. You will also be given a 50-word spelling test (words taken from Worksheets 43 and 63). You must pass this spelling test with a minimum of 90%.

Assignments:

1. Read Topic 7 in your text on pages 9 and 10. Be sure to study each example carefully.

2. Complete Worksheets 24 and 25 and hand your papers in to be corrected.

3. If you were able to attain at least 75% accuracy on Worksheets 24 and 25, you may proceed to the next topic.

4. If you were not able to reach 75% accuracy on Worksheets 24 and 25, your teacher will give you some supplemental material for you to do before proceeding to the next topic in your text.

5. Continue through Worksheet 63 using the steps outlined above.

NOTE: Worksheets 43 and 63 are spelling reviews. These words are given to you on an attached sheet. You are to study these words and you will be tested on them at the end of Part II.

6. After you have successfully completed all the worksheets in Part II, you will be given a 50-word spelling test on the words in Worksheets 43 and 63. You are required to pass this spelling test with a minimum of 90%. If you do not reach this standard, you will be required to take another test on these words.

16377

PART III

PUNCTUATION FOR BUSINESS LETTERS

BEHAVIORAL OBJECTIVE:

At the completion of this part you should be able to use punctuation to provide clear and understandable sentences.

You should be able to complete Worksheets 64 through 73 with a minimum of 75% accuracy and pass a test on Unit III with at least 75% accuracy. This test will consist of a number of sentences for you to punctuate correctly. It will also consist of sentences including numbers. You should be able to write these numbers correctly.

- - - -

This part supplies you with a comprehensive list of punctuation rules and with worksheets for applying these rules. This section is a handy reference source for your use. You should refer to it whenever a question arises about correct punctuation.

A punctuation mark is merely a "signal" from the writer to the reader. For example, a period shows that a sentence has been ended or that an abbreviation has been used. A comma may show a slight break in thought, separate the two parts of a compound sentence, or be used in one of several other ways.

Some sentences may be punctuated in more than one way to convey the meaning of the writer.

Some professions and businesses have their own style of punctuation. A journalist, for example, may omit some punctuation marks which normally are included in a business letter. A lawyer uses many more punctuation marks when preparing a legal form than are necessary for most types of business writing.

The great majority of all questions about punctuation may be answered with a knowledge of a few simple principles. These principles are given in Part III. No attempt is made to give the principles covering the occasional, rare, and difficult problems that may arise.

- - - -

Assignments;

1. Study each topic in this unit carefully.

16379

2. Read each rule and study the example so that you can use it in your own work.

3. At the end of each topic complete the worksheets listed.

4. After completing the worksheets at the end of each topic, hand your papers to your teacher for correction.

5. Your teacher will check your papers and go over them with you.

6. If you are able to complete the worksheet with 75% accuracy or better, you can proceed to the next assignment. If you do not reach 75% accuracy, your teacher will guide you to supplementary material on the specific subject.*

7. When you have completed Worksheets 64 through 73 with 75% accuracy or better, you may take your test on Part III.

8. If you were able to complete the test on Part III with 75% accuracy or better, you may proceed to the next part.

9. If you were unable to complete the test on Part III with 75% accuracy or better, you will be given supplementary material to complete before going on to the next part.

*NOTE: Worksheet 71 is to be omitted.

16380

PART IV

WRITING THE BUSINESS LETTER

BEHAVIORAL OBJECTIVE:

At the conclusion of this part you should be able to write business letters that achieve the results you want. You should be able to use correct letter-writing principles that pertain to organization, completeness, clarity, conciseness, and accuracy. You should be able to type these letters in mailable form.

You should be able to pass a test on Part IV with a minimum of 75% accuracy. This test will consist of questions on the parts of a business letter discussed in Part IV, arrangement and punctuation, styles of letters, and various types of letters.

- - - - - -

Letters are very essential in business. There are times when the letter is the only contact a company has with its customers. Letters are sometimes used to create new business or build good will. It is necessary, therefore, that the letter say what you really want it to in order to reach this result.

Planning is necessary to write a good letter. The letter will represent "you" and your company. The message intended must be clear to get the desired result.

Certain fundamentals apply to all types of business letters. The following points would be kept in mind when writing a letter:

1. Write from the reader's point of view. Use "You" and "yours" instead of "I", "mine", "we", and "ours," You want the reader to feel that the letter was written especially for him.

2. The first sentence is important. The first sentence is the most important one in the letter. It sets the "tone" for the entire letter. Go directly to the point and purpose of the letter without wasting time by referring to long references to previous correspondence. Stress what the reader wants to know.

3. Be concise. You should make every word count. However, don't lose completeness in working toward brevity. You should make your letter just long enough to make your message clear without wasting the reader's time.

4. Be courteous. In making your letter concise don't let your letter sound abrupt. Courtesy will follow naturally if you write with the reader in mind. Don't ever send out a letter in anger. The friendly tone should be evident.

16381

5. Use a positive approach. Even though difficulties may arise in business they can be acknowledged in a friendly tone that suggests that a satisfactory solution can be reached.

6. Be accurate. A letter becomes a record. You must be accurate. If you quote anyone, be sure that the quotation is accurate and the person being quoted would not mind being quoted. Do not talk against anyone's character. Do not make a claim that you cannot back up.

7. Paragraph wisely. Paragraphing in business letters can often be used as an attention getter. Often a business letter is just one idea, but it is more easily understood if it is broken up into more than one paragraph.

8. Be grammatically correct. Good writing depends on the correct use of English. To write a clear, concise letter, the writer must know the rules of English and use them. A letter containing errors in English reflects on the writer and the company.

9. Make your closing effective. Your closing sentence or paragraph should be carefully stated. In short letters the complimentary closing is often the only closing that is needed. Avoid the participal endings such as "trusting," "hoping," and "thanking." These are very weak.

10. Watch your spelling and punctuation. Your spelling should be correct. If you are not sure, use your dictionary. Punctuation helps make the meaning clear to the reader.

- - - - -

Assignments:

1. Read Section I on Business Letter Mechanics in your text. Study this material carefully. Be sure to check with your teacher if you have any questions. The test on Part IV includes questions on this material.

*NOTE: Worksheets 75, 89, and 95 are spelling reviews. These words are given to you on an attached sheet. You are to study these words and you will be tested on them at the end of Part IV.

2. Complete Worksheets 74, 76, 77, and 78.

3. Read Section II of your text on Letters of Inquiry. Study it carefully and check the illustrations. If you have any questions, be sure to check with your teacher.

4. Complete the assignments and worksheets under this section.

16382

NOTE: All Letters must be set up on the typewriter in letter form. You may choose the style you want. Ten points will be given for each letter with one point deducted for each error. Seven points are required to pass. Each letter should be identified in the upper left corner, directly under your name.

5. After completing the worksheets and assignments under this section, hand them to your teacher for checking.

NOTE: Letters and worksheets should be handed in after completing each topic.

6. Your teacher will go over your letters carefully. If you have any problems with a specific letter, she will give you supplemental work to help you overcome your problem. She will also check your worksheets.

7. If you attain at least 75% accuracy on your worksheets and your letters are satisfactory, you may proceed to the next topic.

8. You are to follow the same directions given for Section II (Assignments 3, 4, 5, and 6) for the remaining sections in the book. Be sure to hand letters and worksheets in after completing each topic.

9. After successfully completing all the letters and worksheets in Part IV, you will be given a spelling test on the words in Worksheets 75, 89, and 95. You are to pass this test with a minimum of 90%. If you do not reach this standard, you will be required to take another test on these words.

10. After successfully completing the spelling test for Part IV, you will be given a test on the material covered in Part IV. This test consists of a review of the various parts of the business letter and the arrangement and punctuation styles of business letters.

11. After you have completed the test for Part IV, hand it in for checking.

12. If you were able to attain at least 75% accuracy on the test for Part IV, you will be given the Final Test on Business Essentials. This test will consist of a review of punctuation, capitalization, numbers, vocabulary and sentence completion.

13. If you were unable to attain 75% accuracy on the test for Part IV, you will be given some supplemental work and help from your teacher before repeating the test and going on to the final test.

14. When you complete your final test, hand it to your teacher for checking.

16383

15. If you were able to pass the final test with at least 75% accuracy, you will be given the next unit (Sources of Information) in this course.

16. If you were unable to attain 75% accuracy, your teacher will give you supplementary material and help before retaking the final test.

When you have successfully completed this unit, you will be given Unit II. (Sources of Infotmation)

UNIT II

SOURCES OF INFORMATION

BEHAVIORAL OBJECTIVE:

At the conculsion of the unit you will be able to locate information on a variety of topics, when it is needed, quickly and accurately by being acquainted with the standard reference sources. No test will be given on this unit. This is a continuous unit and should be applied through the course.

- - - -

Text: Applied Secretarial Practice, Sixth Edition, by Gregg, Fries, Rowe, and Travis; McGraw-Hill Book Company, New York, New York 1968.

In most jobs it is not so important to know details of information not primarily connected with your work as it is to know where to find what you want, when you want it. Therefore, you must be acquainted with standard reference sources as well as the resources of your own company office and library. A list of reference sources is included with this unit.

Assignments:

A. Read and study Unit 7, pages 145-161 in Applied Secretarial Practice, Sixth Edition so that you will be able to complete the succeeding assignments successfully.

B. Using the attached sheet, "Reference Sources," And the facilities in the library and the reference material available on the shelves in the Business Department, type the correct answers to the following inquires on a separate sheet of paper. Type the questions and then the answers. Be sure to include the source of your information:

1. Today the following words were misspelled. What is the correct spelling?

   (a) Czecholovakia
   (b) Phillipines
   (c) Wilkes Barre
   (d) Cincinatti
   (e) Milwalkee

2. Your employer has asked you to find a quotation about "friends" which he can use in a speech he is giving on Monday of next week. Locate a quotation on "Friends".

3. Some words are frequently overworked in letter writing. Prepare a list of synonyms that could be used for each of the following:

   (a) nice
   (b) unusual
   (c) important
   (d) fine
   (e) put

4. What is the correct salutation for a clergyman?

5. Should cooperate and reread be hyphenated?

6. Is there a space after the first period in writing Ph.D.?

7. Find the names and addresses of five firms in your community or area that sell linoleum.

8. What is the population of Philadelphia?

9. What is the difference in the meaning of each of the following pairs of words?

   (a) effect
       affect

   (b) accede
       exceed

   (c) principle
       principal

   (d) elicit
       illicit

   (e) correspondents
       correspondence

10. Who said, "He who rebukes the world is rebuked by the world"?

11. Who are the present members of the U. S. Supreme Court?

12. What was the population of St. Louis, Mo., at the last official census?

13. What do the middle initials stand for in the name Samuel F. B. Morse?

14. What was the enrollment at Utah State University last year?

15. Your employer has dictated the following quotations from memory:

    (a) "He that has a merry heart has a continual feast."

    (b) "If you laugh, the world laughs with you; If you weep, you weep alone."

    (c) "The old order changes, giving place to new;
    And God fulfills himself in many ways, For fear
    one custom should corrupt the world."

    Verify the accuracy of each quotation. Give the name of the author and the source (book, play, poem, etc.) of each quotation.

16. What is the source of the expression, "Something is rotten in Denmark"?

17. List ten kinds of information found in the World Almanac or Information Please Almanac.

18. James Rogers used "S. J. D.," after his name, as author of a magazine article. What does it stand for?

19. Using a secretarial handbook, make a list of twelve kinds of information found there that you believe would be especially helpful to you as a secretary.

20. Correct the spelling of the following geographical names:

    (a) Wooster, Massachusetts
    (b) Muncie, Pennsylvania
    (c) Annarber
    (d) San Deago

21. What do the abbreviations sec., opp., prop., wrnt., and asst. stand for?

22. What is the correct formal salutation for all military and naval personnel irregardless of rank or rating?

23. Name two plays written by Thornton Wilder.

24. In looking up quotations, you will find the following abbreviations: ib., ibid., can., v., l., and st. What words do they stand for and what do they mean?

25. Using the two-letter state abbreviations that can be used with zip code, how would you abbreviate the following states? Ohio, Wyoming, Iowa, Florida, and New Mexico?

26. What do e.g. and i.e. stand for and how does one distinguish between their usage?

27. Find the meanings for the following abbreviations: USES, FDIC, CPA, CLU, EKG, and VIP.

28. How would you address a letter for the Governor of Utah? Give the complete inside address for the letter.

29. How far is it from Salt Lake City to Boise, Idaho? to Chicago? to New Orleans?

30. Whose face was said to have "launched a thousand ships"?

31. What do the following abbreviations used by the post office stand for:

    (a) ct.
    (b) sta.
    (c) R.
    (d) Al.
    (e) Ter.

32. A visitor remarked, "This office would be Utopia if it had air conditioning." What does "Utopia" mean?

33. In military or governmental correspondence, how is the date typed?

34. What cities have buildings over 1,000 feet in height? Also, list the name of the buildings.

35. What are the zip codes for the following addresses or cities:

    (a) 180 Fair Oaks Way
        Salem, Oregon

    (b) City Hall
        Inston-Salem, North Carolina

    (c) Monroe Community College
        Rochester, New York

    (d) 6396 Borg Circle
        Ogden, Utah

    (e) Utah cities: Leeds, Hiawatha, Thistle, Deseret, and Sunnyside

36. Look up, identify, and give the correct pronunciation by markings of the following: Pierre, Worcester, Baton Rouge, Eau Claire, San Joaquin, Puerto Rico, Oahu.

37. What is the size of Baronial stationery and the preferred envelope size number?

38. How high is Mt. McKinley?

39. What is the address and zip code for Hill Air Force Base?

40. What is the correct form for an unmarried woman to use on the signature line of a letter?

41. Who won the World's Series in baseball last year?

42. The following address was found on a letter in today's mail: 1439 West 205 North, N.W. What does the "N.W." stand for and should there be a space after the first period? Should this abbreviation be spelled out?

43. In what year and where was Richard M. Nixon born?

44. What title should be used if you do not know if a woman is Miss or Mrs.?

45. What is the fastest means of sending a short written message to England? How will the charge for this message be determined?

46. In what year did George Washington become the first president of the United States?

After successfully completing this unit, you will be given Unit III (Spelling Improvement).

REFERENCE SOURCES

The following list has been prepared that will group reference books under various headings to make it easy for you to locate information:

Information concerning people and business concerns:

1. Telephone directory--contains names and addresses of subscribers.
2. Classified directory--a telephone directory classified according to types of business or professions.
3. City directory--contains names and addresses of residents of a community.
4. Who's Who in America--an alphabetical list of important living people in the United States.
5. Trade, Professional, or Institutional Directories--lists doctors lawyers, insurance agents, and many others.
6. Credit Information--Dun and Bradstreet gives information concerning credit ratings of businessmen and firms. The local credit bureau gives information concerning credit ratings of individuals in a community.

Information concerning words:

1. Dictionaries--spelling, pronunciation, syllabification, meaning of words, and so forth.
2. Synonyms and Antonyms--show words of same meaning and words of opposite meaning.
3. Thesaurus--collection of words according to ideas.
4. Quotations--collection of quotations listed alphabetically according to authors and topics.
5. Secretarial Handbooks

Information concerning facts:

1. The Encyclopedia--gives information on many subjects.
2. The World Almanac and Information Please Almanac
3. The New York Times Index--guide to news items
4. Reader's Guide to Periodical Literature
5. Specialized dictionaries, encyclopedias, and handbooks, based on subject or profession.

Information concerning geography, travel, and transportation:

1. Atlases--collections of maps
2. Automobile guidebooks
3. Gazetteers--names and descriptions of town, cities, rivers, mountains, and countries
4. Maps--road maps, subw ay maps, and so forth
5. Official Hotel Red Book and Directory
6. Shipping and railway guidebooks
7. United States Official Postal Guide
8. National Zip code directory

UNIT III

SPELLING IMPROVEMENT

BEHAVIORAL OBJECTIVE

At the conclusion of this unit the student will demonstrate his mastery of business vocabulary through spelling correctly, according to the rules set up in the unit. He will complete various assignments and be able to pass three diagnostic tests and one achievement test with a minimum of 90% accuracy.

- - - - - -

Text: English Style Skill-Builders, Joseph B. Cleary, Ed.D.; McGraw-Hill Book Company, New York, New York 1967

The major area of knowledge in which stenographers need improvement is SPELLING. Correct spelling is a "must" for the prospective stenographer. The "mailable" transcript is the only standard for judging the quality of a transcript--a misspelled word automatically makes the transcript unusable.

Assignments:

1. Obtain a spelling improvement booklet from your teacher.

2. Read and study carefully the material on page 1 and 2 of the booklet. Pay particular attention to the "Study Techniques" listed on page 1. These techniques give good suggestions on how to spell better.

3. Go over the list of "Business Words" on page 2. This list is made up of words frequently misspelled in business correspondence. You can master the spelling of these words if you follow the procedure set forth under "Study Techniques" on page 1.

As you study this list of words, start your own "study list" of the words that may give you trouble. You should add to your "study list" from time to time as you come across words that are difficult for you to spell in your various transcription assignments.

You will be tested on your mastery of these words in the drills to follow--study them well.

4. After you have studied the words on page 2 carefully, ask your teacher for Drill 1.

5. You are to type your answers to the questions in the drill on a piece of type paper. Be sure to number each question (you do not need to type the lines). You should identify your paper by typing

16394

your name and drill number in the upper left corner of your paper. Use double spacing. You may use both sides of the paper when necessary so all of the drill can be on one sheet.

6. After you have completed Drill 1, check it with the key. Take one point off for each error. Put the total errors at the top of the paper. Add the words you have missed to your "study list" so that you may master these words. Hand your drill in to be recorded.

Read and study page 3 in the spelling improvement booklet. You may also add cities in your own area, that might give you trouble, to your list.

The "memory aids" are good suggestions--make some of your own.

7. Obtain Drill 2 from your teacher and proceed as directed in Assignment 5 and 6. The letter in Drill 2 should be typed twice--single spaced on the back of the paper used for Drill 2. This is a typing drill, and the errors should be counted in the total for Drill 2.

8. Read and study 1, 2, and 3 on page 4 of the spelling improvement booklet.

9. Obtain Drill 3 from your teacher and proceed as indicated in Assignments 5 and 6.

10. Study 4, 5, 6, 7, 8, 9, and 10 on pages 4 and 5 of the spelling improvement booklet.

11. Obtain Drill 4 from your teacher and proceed as directed in Assignments 5 and 6. In Drill 4B type the entire word in each case.

12. Obtain the Diagnostic Test A from your teacher. Type your answers on a piece of type paper. Use double spacing and number each item. You do not need to type the line or the rule number. Be sure to identify your paper as you did on your drills.

13. After completing the Diagnostic Test A, hand your paper to your teacher for checking. If you were able to attain 90% or more accuracy on this test, you may proceed to the next step. If not, your teacher will give you supplementary material.

14. Study the words frequently confused in transcription on pages 5 and 6 of the spelling improvement booklet. Even though words may sound alike they are spelled differently. It is necessary to know the meaning of the word to be able to spell it correctly.

15. Obtain Drills 5 and 6 from your teacher. Type the answers to Drill 5 on one piece of paper and Drill 6 on another. In Drill 6, type the entire letter using single spacing. Fill in the correct word and underscore it.

ILLUSTRATION SHEET 5.

1637

16. After completing Drills 5 and 6, check them with the key according to Assignment 6.

17. Obtain the Diagnostic Test B from your teacher and complete it according to Assignments 13 and 14.

18. Read and study the material under "One Word or Two?" on pages 6 and 7.

19. Obtain Drill 7 from your teacher and proceed as directed in Assignments 5 and 6. Type the entire letter Drill 7 using single spacing. Fill in the correct word and underscore it.

20. Read and study the material on pages 7 and 8.

21. Obtain Drills 8 and 9 from your teacher and proceed as instructed in Assignments 5 and 6. Be sure to put each drill on a separate piece of paper.

22. Obtain the Diagnostic Test C from your teacher and complete it according to Assignments 13 and 14.

23. Obtain the Achievement Test from your teacher. Type your answers on a sheet of type paper. Use double spacing and number each item. You do not need to type the line. Use one sheet of paper. If necessary, use both sides of the paper.

24. After completing the Achievement Test, hand it to your teacher for checking.

25. If you were able to attain at least 90% accuracy, you have completed the unit on Spelling Improvement. If you were unable to attain 90% accuracy, your teacher will give you supplementary material and help before retaking the test.

After you have completed Unit I, Unit II, and Unit III of this course, you will be awarded a letter grade and one-half credit.

PART FIVE

ON-THE-JOB TRAINING

16397

ON-THE-JOB TRAINING

BEHAVIORAL OBJECTIVE:

The student should be able to adapt herself to an actual job situation. This is accomplished by working in one of the school offices performing the various tasks of that office or completing a simulated office unit. Students will be evaluated on ability to perform on the job as to skills, attitudes, dependability, initiative, grooming, and personality. No test will be given on this unit.

- - - - -

INSTRUCTIONS:

You must complete Unit I. Review of Typing, of the Secretarial Procedures or Clerical Office Course. This unit is presented the first week of school. However, if more training is needed on a certain skill, it must be completed before you are placed on the job.

You will be placed in one of the school offices two hours a day for a nine-week period where you will have various tasks to perform.

A copy of the evaluation sheet used is attached. The evaluation given will determine your grade for the course.

After completing your nine-week training period, you will be issued a letter grade and one-half credit.

NOTE: If a simulation unit is used, it will substitute on-the-job training in a school office and will be given the second semester, one hour a day for a nine-week period. At the conclusion of this simulation unit, you will be awarded a letter grade and one-fourth credit.

Directions: Read over each line carefully. Circle the number over the phrase which describes the student most accurately. Make only one circle on each line, and be sure to circle every line.

1. Appearance

10	9	8	7	6	5	4	3
Makes an excellent appearance		Usually neat and tidy in appearance		Sometimes neglects appearance		Should improve appearance	

Comments: _____

_____

2. Personality

10	9	8	7	6	5	4	3
Personality is outstanding		Has a pleasing personality		Personality is unimpressive		Does not get along well with others	

Comments: _____

_____

3. Interest

10	9	8	7	6	5	4	3
Usually enthusiastic about work		Shows interest in work most of the time		Interested only in certain phases of job		Should show more interest in work	

Comments: _____

_____

16399

4. Cooperation

10	9	8	7	6	5	4	3
Goes out of way to cooperate		is usually cooperative		helps only when asked		Does not work well with others	

Comments: _____

_____

5. Directions

10	9	8	7	6	5	4	3
Reliable in following Directions		Usually follows Directions well		Sometimes careless in following directions		Cannot always rely on to follow directions	

Comments: _____

_____

6. Initiative

10	9	8	7	6	5	4	3
Recognizes work to be done and does it without direction		Sometimes goes ahead in work not assigned		Performs regular routine duties only		Seldom seeks work beyond regular routine duties.	

Comments: _____

_____

7. Judgment

10	9	8	7	6	5	4	3
Wise in actions and in making decisions		Usually shows sound judgment		Sometimes shows lack of judgment or discretion		Lacks ability to make sound decisions	

Comments: _____

_____

8. Absence

10	9	8	7	6	5	4	3
Has perfect attendance		Occasionally absent but with good excuse and advance notification		Occasionally absent without good excuse		Frequently absent	

Comments: _____

_____

9. Tardiness

10	9	8	7	6	5	4	3
Always on time		Occasionally late but with good excuse		Sometimes late without good excuse		Frequently late	

Comments: _____

DESCRIPTORS - *INSTITUTES (TRAINING PROGRAMS); JOB TRAINING; *FIRE FIGHTERS; *TRADE AND INDUSTRIAL EDUCATION; *FIRE SCIENCE EDUCATION; SIMULATION; CITY GOVERNMENT; TRAINING TECHNIQUES; INSTRUCTIONAL FILMS; *INSTRUCTIONAL MATERIALS; TEACHING GUIDES; CURRICULUM GUIDES; STUDY GUIDES

ABSTRACT - Developed by the Instructional Materials Laboratory of the California State Department of Education for use by local fire departments in planning, developing, and maintaining fire training programs, this instructional manual provides a guide for intensive training in controlling and extinguishing oil and gas fires. The contents, following the plans used by oil industry instructors and by several fire service schools, are divided into four parts: (1) Fundamentals, (2) Oil Fire Control Problems, (3) Practical Training Techniques, and (4) Oil Fire Training Films. The manual is illustrated with numerous photographs and diagrams. (GEB)

FOREWORD

Firemen must be properly trained to meet their responsibilities. Not all of their training can be acquired early in their employment because fire problems change as new combustible materials are invented or used, new kinds of structures are designed, and new methods of fire protection are developed. Training, therefore, must be an on-going process to keep the experienced man abreast of developments as well as to teach the rookie. Training is also necessary for the special areas of fire work, of which the control of flammable liquids and gases is one.

The greatest problem in training firemen for oil fire control is providing adequate experience. This manual shows how to set up practice fires with small, inexpensive props. It outlines practice drills step by step and presents demonstrations for the drill field and the classroom. In addition, it contains related information and sources of visual aids.

This manual should be most useful in planning, developing, and maintaining fire training programs. It should also stand as a tribute to the public servants and members of the oil industry who developed these important techniques.

Max Rafferty

Superintendent of Public Instruction

16407

Assignment

WS. 7. Circle Graph: A circle is given which represents a 24 hour day. First make a plan of how many hours you spend each day on each of the activities shown in the chart in the lower left-hand corner of the Work Sheet. The hours should total 24, the number of hours in one complete day (day and night). Draw guide lines in the blank spaces of the chart and letter carefully the number of hours you have chosen for each of the activities shown. Try to allot your time so that you have no fractions of hours under ½ hour, such as, meals 1½ hours. Now letter in the ratio of hours each activity takes in relation to the whole day. An example of this might be the case of a boy who spends 9 hours in sleep. The ratio would then be 9/24 (or reduced - 3/8).

From our study of arithmetic, we know that a complete circle divided into 24 parts (360° ÷ 24) would equal 15 degrees for each part, or 15 degrees represents 1 hour. To find how many degrees each activity will take up on the circle, multiply the number of hours for the activity by 15 degrees. As an example, if a boy slept 9 hours of the day, he would multiply 9 times 15 degrees and his answer would be 135 degrees to represent hours spent in sleeping.

Find the degrees for each activity, as in the example above, and check to see that the total comes to 360 degrees. Now letter-in neatly (do not write as in arithmetic) the degrees for each activity.

PREFACE

Most firemen are experienced in fighting average structural fires, such as fires in residences, business establishments, and factories. Some firemen are specialists in forest and brush fires. Some are experienced in ship fires and airplane crash fires. Large oil fires are also in a special category. In some areas of California, where oil fields and refineries are concentrated, the local firemen have had much experience with oil fires, and they work closely with the oil industry fire protection engineers.

For many years the fire protection personnel of the oil industry have conducted small oil fire training sessions with firemen in limited areas. In 1955 the Fire Training Program of the Bureau of Industrial Education, California State Department of Education, organized a statewide Oil Fire Control School at Bakersfield. The Kern County Fire Department, with long experience in fighting oil fires, and the oil industry fire protection personnel (through the Western Oil and Gas Association Fire Committee) cosponsored and operated this school in cooperation with the State Fire Training Program.

This three-day school started March 24, 1955, with 583 firemen attending the indoor classroom sessions and outdoor fire demonstrations and participation drills. A repeat school was held on March 9-11, 1961, with 641 firemen in attendance. Obviously, many firemen were unable to participate in this training, and they have asked for more schools. Since these large-scale projects are costly and time-consuming, however, they cannot be held often.

To assist local fire departments in conducting their own oil fire training programs, therefore, members of the California Fire Training Program staff decided that this manual should be prepared. It contains most of the material from the manuals used at the Bakersfield schools. The papers have been revised and brought up to date, and a large amount of new material has been added.

The writers have had long experience in the practical side of the prevention, control, and investigation of oil and gas fires. Men who know them consider them experts in this field. Each of the papers indicates the name of its author except the papers that have been added by the editor, James E. Hill, formerly of Union Oil Co. of California. The editor also wrote introductions to help the

16408

reader relate the subject of each paper or group of papers to the entire field of oil fire fighting. The project was developed under the auspices of the California Fire Training Program, Thomas S. Ward, Supervisor.

INTRODUCTION

Gasoline causes more fires than solvents . . . kerosene . . . diesel, stove, and fuel oils . . . lube and grease stocks . . . and asphalt--or all of these combined, even though their total volume is more than that of gasoline. These products are nonvolatile and less hazardous than gasoline, and their fires are much easier to extinguish.

Most vehicles use gasoline. In 1961 there were 63 million automobiles and 11 million trucks in the nation. In 1962, in California alone, 8.6 million cars and trucks used more than 6 billion gallons of gasoline. Still more is used in motor boats, power lawn mowers, stationary engines, etc.

When the enormous consumption of gasoline is considered, it is surprising that more fires do not start from the misuse and mishandling of this fuel. Possibly it speaks well for the fire prevention codes and standards and safe practices within the oil industry itself. Continuing education of fire service personnel, oil industry people, and the consumer is the most important factor in reducing the annual national fire loss of $1.5 billion. This loss presents a continuing challenge to us all.

Part of the answer to this challenge is, it is hoped, the publication of this manual. It is a guide for intensive training in controlling and extinguishing oil and gas fires. Its content follows the plan developed by oil industry instructors for training oil industry employees and used in several fire service schools in addition to the Bakersfield Oil Fire Control Schools of 1955 and 1961. Parts 1 and 2 of this manual present topics covered in the classroom sessions of the Bakersfield schools. These represent the theory of the course--basic information and techniques of fighting oil fires.

Part 3 covers the outdoor, practical portion of the instruction. Firemen often find this to be the most interesting part of the work. Included are drills for the men and demonstrations to be presented by the instructors, together with instructions for constructing inexpensive, adequate props for many fire problems. Questions and answers, to test readiness for these field problems and to stimulate discussion and review, are included in Part 3. So is a history of fire schools, which contains photographs of additional props.

16410

Part 4 lists films that are helpful in training men for oil fire duty.

Although the authors are members of the western oil and gas industry, they do not necessarily describe the opinions or practices of all participants in the Bakersfield Oil Fire Control Schools or of the members of the Western Oil and Gas Association. Nor have they attempted to cover completely all of the subjects relating to oil fires.

PART 1 FUNDAMENTALS

16413

1 BASICS OF OIL FIRE PROTECTION

This is an elementary explanation of the term "fire protection" and of the burning characteristics of different gas and oil fuels. It lays the groundwork for the papers that follow.

Every fireman knows that water should not be put directly into a hot tar pot--and why. He knows that he should not extinguish a gas fire unless the gas fuel has been shut off. However, he may not know other important techniques that are not so obvious. Many oil fires are handled improperly and unsafely because the fireman has not learned the fundamentals. This applies to all phases of fire fighting but it is especially important with oil fires, because different fuels sometimes behave differently.

The fundamentals presented in this paper should be reviewed thoroughly. While reading the material, for instance, underline what is meant by "flash point" and "flammable limits" of a fuel. After you have finished reading, try to recall the meanings of these terms and the other important facts. Then answer the questions in No. 5 of Part III, and compare your answers with the answers provided. (This paper is a revised reprint from the manuals of the 1955 and 1961 Bakersfield Oil Fire Control Schools.)

"Fire protection" is a combination of fire prevention, fire control, and fire extinguishment. Fire prevention is taught to acquaint people with the causes of fires so they can be prevented more readily. Fire control is taught to minimize the spread of fire and to decrease the damage from fire. Some fires are fought best by permitting the fuel to burn out under control until the source of fuel can be shut off. Fire extinguishment is taught so that fires can be fought quickly, skillfully, and effectively.

Essentials of Combustion

In order for fire to start, three factors must be present together and under the right conditions: fuel, air, and a source of ignition.

Fuel. Fuel is something to burn. Oil fuels normally must be in the form of vapor to burn. Some fuels already are in vapor form or will release vapor at ordinary air temperatures. LP (liquefied petroleum) gas and gasoline are examples of this type of fuel. Heavier oils, wax, asphalt, tar, and most solid fuels, such as wood, will supply vapor when heated. They must be raised to their flash point before they can be ignited.

16414 J/

The "flash point" of an oil is that temperature to which the oil must be heated to give off enough vapor to ignite when a flame is brought near it. The flash point test is performed in standardized laboratory apparatus. Gasoline, being very volatile, has a low flash point, about -50° F. When the very volatile fractions are removed from gasoline in the refinery, a relatively safe cleaning solvent (Stoddard Solvent) is made. Its flash point is about 105° F. Other oils have still higher flash points, as shown in Table 1, which also indicates the flash points of two oils that are less volatile by far than the rest. All these oils are termed "nonvolatile."

TABLE 1
Flash Points of Various Oils

Type of Oil	Approximate Degrees F
Kerosene	125-140
Stove oil	120-165
Diesel oil	150-180
Heavy fuel oil	150-180
Lube oil	450
Petroleum wax	450

Nonvolatile oils, which are any oils with flash points higher than the ordinary temperature of air, are relatively safe if not heated above their flash point.

Under some rare conditions, mists or sprays of high flash oils may actually ignite. Such an occurrence is similar in principle to explosions of flour or coal dust.

Air. The second essential for combustion is air, which is needed to supply the oxygen necessary for combustion. Air contains 21 percent oxygen. The remaining percentage is composed primarily of nitrogen, which, being an inert gas, neither burns nor supports combustion. All oil and gas fuels require air to burn. For example, one volume of gasoline vapor requires nearly 16 volumes of air to burn. This is equivalent to a mixture containing about 94 percent air and 6 percent vapor.

A practical example of the burning limits of an air-gasoline vapor mixture is illustrated by the automobile engine. Under atmospheric conditions, if there is less than about 1 percent vapor in the mixture, it is too lean to burn, and

16415

if there is more than about 6 percent vapor present, the mixture is too rich to burn. This range between 1 and 6 percent for gasoline is called its "flammable" range. Kerosene and other common oil vapors have approximately the same range or limits.

Flammable ranges of other common fuels are shown in Table 2.

TABLE 2
Flammable Ranges

Fuel	Approximate Percent
Fuel gas (methane)	5-14
Propane	2-10
Butane	2-9
Hydrogen	4-75
Acetylene	3-81
Grain or ethyl alcohol	4-19

The specific figures for each fuel are called its "lower flammable limit" and "upper flammable limit." Although the term "explosive limit" sometimes is used, it is not accurate, since ignition and fire usually occur without an explosion.

A source of ignition. A fire cannot start without a source of ignition. The heat must be in sufficient quantity and at a sufficiently high temperature to ignite petroleum vapors.

The ignition temperature of a fuel vapor is the lowest temperature to which a flammable fuel-air mixture must be heated to ignite. The ignition temperature of a fuel is not a fixed value since it depends upon the method of contact of the flammable mixture with the heating surface and other factors. For example, the ignition temperature of gasoline vapor may vary from about 500° F to above 1000° F, depending upon the testing method. The NFPA Handbook of Fire Protection, twelfth edition, lists the ignition temperature of gasoline vapor at 536° F to 880° F, depending on the grade. These are temperatures established by special testing methods where a static film of fuel is exposed to a hot surface. In ordinary practice, when gasoline vapor flows over a hot surface or liquid is sprayed on it, as has been determined by practical tests, the hot surface must be well above 1000° F to produce ignition.

Some fuels ignite more readily than others. For example, gunpowder, hydrogen, and acetylene and some others ignite much more easily than LP gas or gasoline vapors.

16416

Ignition temperature values should not be confused with flash points. The flash points indicate ease of evaporation; ignition temperatures indicate the ease of ignition. The lighter oils (such as propane, butane, gasoline, and others), being highly volatile, have flash points much below zero but, being stable chemicals, ignite at high temperatures--over 1000° F. Heavy oils, like lube oil, wax, and asphalt, have high flash points but ignite at temperatures relatively lower than the lighter oils. Also, as heavy liquids, they may remain in contact with a hot surface, while the lighter oils will not.

A flame is an unfailing source of ignition. Hot arcs from electric power or lighting circuits and storage batteries are well-known ignition hazards. Minute, low-energy electrical sparks from some sources, such as a three-cell flashlight, do not ignite petroleum vapors. But sparks from static electricity may be ignition hazards.

Friction sparks from hand tools have been found to have too little energy to ignite petroleum vapors, although they may ignite gunpowder, hydrogen sulfide, or other easily ignitable materials. Friction sparks from a cigarette lighter come not from steel, but from a special alloy; they contain sufficient heat to light vapor from lighter fluid (similar to gasoline). The glowing coal from a cigarette usually is at too low a temperature to ignite petroleum vapor in air, but impurities in the tobacco or paper can cause ignition. The hot ash can ignite paper, which, as it burns, can in turn ignite oil vapor. The discarded match is also a great potential hazard.

To summarize, fire requires three conditions to start:

1. Fuel in vapor form (or under some conditions, in a finely atomized form).
2. Air in proper proportion with the fuel vapor (within the flammable range).
3. A source of ignition, with heat of sufficient amount and temperature to ignite the particular fuel vapor.

Fire Prevention

To prevent fires, one of the three essentials of combustion must be kept away from the other two. Fuel should, as much as practicable, be kept in closed substantial containers and should not be permitted to escape. Air is present almost everywhere; hence, except in special cases involving closed vessels or gas-blanketed or inerted systems, exclusion of air is not a practical way of preventing fire.

Sources of ignition should be controlled. In many areas, smoking is prohibited, "hot work" (welding) cannot be done without special safety permits;

16417

Using a protractor divide the circle into parts representing each activity by degrees.

Shade each division according to the legend shown in the right-hand corner of the Work Sheet. Use the T-square and triangle for drawing your lines. Now letter the title strip and have your drawing checked and graded.

WS. 8. Bar Graph: Complete the lines of the bar graph using the figures given in the table. The table shows the miles per hour (M.P.H.) traveled by an automobile, the distance traveled while thinking, and the distance traveled while using the brakes before coming to a complete stop. Use the scale given at top of the sheet for projecting down the number of feet required for "thinking" and the number of feet required for "braking". Use the 60 degree triangle for the lines which indicate "thinking". Shade in with your pencil the solid part which indicates "braking". Letter your title strip. Have your drawing checked and graded.

WS. 9. Oil Field Map: This Work Sheet shows twelve sections of a township. A section is a square 1 mile on a side, so a section is 1 square mile in area. By projecting with a T-square and triangle, draw light lines from the scales at the left and bottom of WS 9. This will give you a system of grid lines for locating objects on the map. Locate the following wells and structures as indicated by the coordinates given below. The first of the two numbers given is found on the bottom scale. The second number is found on the scale at

electrical work is done by qualified persons; and certain static protection devices and procedures are used.

Fire Extinguishment

To extinguish fires one of the three essentials of combustion must be removed from the other two. These three methods are commonly known as:

1. "Starving"--removing fuel from air and heat.
2. "Quenching"--removing heat from fuel and air.
3. "Smothering"--removing air from fuel and heat.

Common methods of extinguishing oil and gas fires employ one or more of these methods. For example:

Starving. Removing fuel supply is the best method of extinguishing gas and LP gas fires and many fires involving liquid fuels. Certain positive methods include closing valves, crimping, or plugging pipelines. Water can be pumped into a leaking pipeline or tank so that the water replaces the oil at the leak. Closing a dome on a tank truck prevents escape of the vapor.

Quenching. Cooling with water is a common method. The use of water fog to chill a burning oil surface below its flash point or the use of water on wood fires is considered to be quenching by some. Actually, this is a method of starving, as it consists of stopping the source of flammable vapor.

Smothering. Removing the air supply is the third method. Using steam, carbon dioxide, or carbon tetrachloride vapor reduces the oxygen content of the air at the seat of the flame to 12-15 percent, or below, and smothers the fire. When water fog is used on gasoline fires in deep containers, the steam generated may smother the fire.

Applying a foam blanket on a gasoline fire or frothing a fire of viscous oil with water can be considered either starving or smothering. In practice, it simply is separating the air from the vapor or vice versa.

The use of chemical powder does not clearly fall into any one of these three categories. It does not supply sufficient CO_2 by decomposition of the sodium bicarbonate to smother the flame. The subject of dry chemical extinguishers is discussed later in this paper.

Extinguishing Agents

Each type of extinguishing agent has its own special applications and limitations. For this purpose, oil and gas fires may be divided into two subgroups;

16418

1. Oil fires burning from a substantially flat horizontal surface, such as in a tank, vat, trench, or a spill on the ground. Sometimes they are referred to as "two-dimensional" fires.

2. Oil fires involving jets, sprays, or falling burning streams of oil or fuel flowing down a vertical or a slanting wall or surface. Sometimes they are referred to as "three-dimensional" fires. Vapor or gas fires are in this class.

The best type of agent or agents to employ depends upon the nature or type of fuel and whether it is a two- or three-dimensional fire.

Foam. Formerly considered the most effective extinguishing agent for all oil fires, foam seldom is used today, primarily because of the rarity of tank and large-area spill fires and because of the modern development in the use of fog nozzles and dry chemical extinguishers. Spill fires involving high flash oils (like kerosene and diesel) used to be fought with foam, but today they are extinguished successfully with water fog. The only exceptions are very large spills, which are beyond the reach and capacity of fog nozzles, and large tank fires, where foam must be used. Tank fires are relatively uncommon in the oil industry, considering the enormous number of tanks in use. Since they require special techniques, they are not discussed in this paper on basic principles. Fires involving large spills or open areas of gasoline, light crude oil, and jet fuels (as in a tank) normally are handled by foam. The flash point is too low for the fuel to be extinguished by water fog. Sometimes foam is applied to an unburning spill of gasoline to stop rapid evolution of vapor and reduce risk of ignition.

To form an effective blanket, the foam should be applied gently so it flows across the surface. In some cases, the foam may be applied to some smaller gasoline fires as a "fog foam," gently raining down onto the burning oil surface to form a blanket. Some liquid fuels (alcohol, ether, ketones) quickly decompose a foam that is effective on oil fires. For such fuels a special "alcohol foam" is required.

Of course, foam must not be applied to a hot asphalt tank, because it will froth over. Such fires sometimes can be extinguished by very skillful and gentle applications of long-range water streams by frothing the burning surface. Spill fires involving hot asphalt and other high flash, froth-producing oils can be controlled best by water fog or broken-up straight streams.

Water fog or spray. This is the most common and the most satisfactory extinguishing or controlling agent for most oil and gas fires. As water evaporates, it absorbs more heat than any other material. The fine droplets of water in water fog provide large surfaces for evaporation and greatly reduce

16419

the fire intensity or extinguish the fire of high flash oils. The steam produced may act as a smothering agent.

Fog is effective in controlling and reducing the intensity of gasoline, LP gas, and gas fires; it protects personnel while they close valves or perform other emergency operations. It may be used on two- or three-dimensional gasoline fires until the proper extinguishing agent or means is available. It is excellent

Los Angeles County Fire Department

Fig. 1. Cooling the top surface of an LP gas tank truck that is half full of butane. The fuel to the ground fire under the tank truck has been shut off, and the cooling of the two sides of the shell is continuing.

16420

for controlling a gas or an LP gas fire and it minimizes damage and spread until the source of fuel can be shut off. Fog is also very effective for extinguishing two- or three-dimensional fires of fuels having a flash point above atmospheric temperature, if they are within the capacity of the nozzles.

Some firemen have been prejudiced against the use of water on an oil fire because, when misused, water has caused bad spread of the fire. Also there was some prejudice against fog nozzles because early nozzles were inefficient. Oil industry fire fighters, using modern nozzles, have demonstrated the great effectiveness of fog on the most stubborn and difficult types of oil fires.

Straight streams. Straight streams of water also have their place for certain fire control and extinguishing uses. Although the large coarse drops from straight streams are much less effective than water fog, they do cool hot surfaces at long range. Water, either in the form of broken straight streams or fog, is effective in cooling and protecting pressure containers and preventing them from overheating and rupturing in an exposure fire (see Fig. 1). As little as 0.1 gpm per square foot of surface often is adequate.

Broken straight streams are effective in frothing certain viscous oils and extinguishing flat surface fires of such oils.

Dry chemical extinguishers. The most effective hand extinguishers utilize sodium bicarbonate (baking soda), which, being a solid, may be projected at a considerable range into the seat of the fire. The dry chemical powder in the flame zone interferes with the complex chemical chain reaction of burning and extinguishes the fire. A technical discussion of this complex subject appears in the NFPA Quarterly, April, 1960, page 334. The powder is milled with a water-repellent agent. This not only keeps it fluffy when dry but also permits the solid powder to be projected through a water fog blanket. A very severe fire may be reduced in intensity by water fog and extinguished simultaneously by the dry chemical.

When a fire has burned for some time, it may form embers or hot surfaces. If these are not cooled by water fog first, the dry chemical may extinguish the fire, but the vapor may reignite. The effectiveness of dry chemical extinguishers may be enhanced greatly by using them in combination with water fog. This special technique should be learned by training with live fires.

Carbon dioxide. CO_2 is effective where the entire area or front of the fire can be blanketed to prevent reignition. Its range is much less than that of the dry chemical, and it is seriously affected by wind.

Carbon tetrachloride. The "CTC" extinguisher agent was good in its day but it has passed out of favor because of the toxicity of the vapor and its lack of

16421

236 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

effectiveness in comparison with CO_2 and dry chemical. Also, "CTC" extinguishers are less dependable mechanically. Carbon tetrachloride is electrically nonconductive.

Soda acid extinguishers. These extinguishers have their place for combating ordinary combustible fires, but they are being replaced by water pump tanks and garden hoses.

Miscellaneous Notes

Problems of spontaneous combustion are encountered wherever paints are involved. The mineral ingredients in paints are mixed with a thinner (turpentine or mineral oil thinners) and a vehicle (linseed oil or equivalent). When paint is applied to a surface, the thinner evaporates and the vehicle oxidizes and hardens the paint. This oxidation liberates heat, but the heat is conducted to the air without an appreciable rise in temperature. If paint or linseed oil is left in wadded rags, the oil will oxidize slowly, just as it does on a wall. Because the heat of oxidation cannot escape, however, the temperature rises and the oil-soaked rags finally may burst into flame.

Common oily materials (other than paint oils) that may cause spontaneous combustion include okum, tung oil, and fish oil. Petroleum or other mineral oils do not oxidize in this manner to cause spontaneous ignition. Any oily rag, however, must be considered dangerous unless the type of oil is known. Rags containing grease lubricating or other mineral oils act as a good kindling medium when involved in a small fire. Unless disposed of promptly, they represent poor housekeeping.

Sources of information. For the past 30 years, fire protection engineers in the petroleum industry throughout the United States have corresponded and have met periodically to discuss oil fires, compare tests on fire fighting methods and equipment, and exchange information. Through this interchange, much valuable information on fire protection has been accumulated, and some of it has been published. Copies are available by writing to Director, Division of Science and Technology, American Petroleum Institute, 1271 Avenue of the Americas, New York 20, N.Y. The National Fire Protection Association also has published some excellent papers on fire protection of flammable liquids. Write to Flammable Liquids Engineer, NFPA, for information.

236 16422

2 IGNITION AND COMBUSTION

Oliver W. Johnson
Standard Oil Co. of California

Before starting to read this paper, glance through it and read the headings. Reading them will provide an idea of the scope and content prior to more detailed study. Note that the paper deals mainly with fire prevention, which is closely allied to fire extinguishment and is equally important. The discussion still concerns proper terms and their meanings. Necessarily, there is some overlap with the preceding paper, and this is good. It re-emphasizes the important facts but presents them in slightly different ways. It also lays the groundwork for the applied phase of oil fire fighting, which follows in Parts II and III.

This paper is more technical than the first, and it shows that fire protection in the petroleum industry is not a simple subject. Study it carefully, because it contains much valuable information. It should correct some prevalent misconceptions and aid in the investigation of fires. (This is a revised reprint from the manual of the 1961 Bakersfield Oil Fire Control School.)

Prevention of accidental and uncontrollable fires is the principal objective in fire protection. The word "accident" implies something neither planned nor expected, but it does not mean that the event is ruled by chance. In the words of one authority, "An accident is viewed as occurring in the regular course of things, but subordinate to the main purpose, or aside from the main design." Since an accident is something unforeseen, it follows that accidents may be prevented by forethought and knowledge. This is true of accidental fires.

Fire prevention is sometimes approached with the goal of eliminating everything that will burn. At other times the approach is to attempt to exclude everything that could be a means for the start of a fire. Neither course, however, can be carried to its conclusion in an industry where all principal products are combustible, and where heat (and fire) is the principal agent in the refining process and the basis of transportation of the products.

In petroleum operations generally, the most practical approach to fire protection is, first, to learn how accidental fires start; and, second, to work out procedures and practices that will be both effective and economical in assuring that the unexpected does not happen. If all contingencies are considered, there may be "incidents" but no "accidents."

An intelligent approach to fire prevention requires knowledge of the processes of ignition and combustion. The following sections give some basic information on these subjects and indicate sources of more detailed information.

 16423

Definitions

"Combustion" may be either burning or only a chemical process. It is the rapid reaction of oxidizable material with oxygen (usually, oxygen in the air), accompanied by heat and, usually, flame.

"Fuel," used in the broad sense, means a material capable of undergoing combustion. It particularly designates the material (gas, liquid, or solid) that feeds a fire.

"Flammable" refers to any material that is very easily ignited or that burns rapidly. It is usually applied to gases or liquids. The synonymous term "inflammable" is now considered obsolete because it was too readily confused with "nonflammable." Flammable liquids, as legally defined, have a flash point under 200° F.

"Combustible" refers to that property of a material that can burn, and the term implies less risk of accidental ignition and flame spread than "flammable" does. There is, however, no precise demarcation between a material that is flammable and one that is combustible. The word "combustible" is frequently applied to solid fuels and sometimes to liquids having flash points of 200° F and above.

Fire Triangle

The three essentials that must be present in order for a fire to start are frequently illustrated by a triangle, in which the three sides are labeled "fuel" (vapor), "air" (oxygen), and "source of ignition" (heat).

Fuel. For this demonstration, fuel must be present in dispersed form as a vapor. Liquid fuel mists or finely divided solid fuels that are readily converted to vapor have much the same combustion characteristics as vapor. (Carbon and some metals are exceptions to the general rule that fuel must be in the form of vapor before it can burn.)

Air. Air (which supplies the oxygen necessary for combustion) must be present and mixed in suitable proportion with the fuel vapor to form a mixture that can be ignited.

A source of ignition. Some source of ignition (high temperature and energy sufficient to initiate the chemical reaction of combustion) must be present.

The start of a fire requires the presence of all three at the same time and place. Extinguishment usually requires that either the fuel or the air be eliminated or that they be prevented from reaching one another.

16424

Elements of Fire Prevention

Practical fire prevention requires a thorough understanding of:

1. Vaporization--the conditions under which flammable and combustible materials vaporize.
2. Flammable mixtures--what is meant by "suitable proportions."
3. Ignition sources--and how combustion spreads from such sources.

Torrance Fire Department

Fig. 2. Typical apparatus for a tabletop demonstration on flammable liquids. Note the fire triangle.

Vaporization. To understand the process of vaporization, consider the surface between a liquid and a closed, air-free space above it. Molecules of the liquid tend to escape from the liquid state and assume the properties of a gas. Other molecules previously released may strike the liquid surface and

16425

re-enter it. When the number of molecules leaving and re-entering the surface becomes equal, a state of "equilibrium" is said to exist. At equilibrium, the pressure exerted by the molecules in the vapor state is called the "vapor pressure" of the liquid at that temperature. Vapor pressure is a characteristic of any liquid. The vapor pressure of a liquid increases as its temperature is raised.

If the space above the liquid already contains a gas--say, air--vaporization will proceed exactly as above. When equilibrium is established, the space above the liquid will contain just as many vapor molecules as though the air were not there. The liquid evaporates just as though the air were not present. The total pressure exerted by the vapor-plus-air mixture, however, now will be greater by the pressure exerted by the air. The partial pressure of the vapor divided by the total pressure of air-plus-vapor is the volume percent concentration of the vapor.

For easy comparison, vapor pressures of petroleum liquids usually are measured at a standard temperature--100° F--by the Reid method described in ASTM Standard D-323. From the fire protection standpoint, it is the vapor pressure of a liquid petroleum product at the temperature at which it is handled that is significant, because it is this vapor pressure that controls the composition of the air-vapor mixture over the liquid surface.

Vapor pressure cannot readily be measured in the low range where it is significant as a criterion of fire hazard. Hence, the results of another test, the flash point test (described later in this paper), is more generally relied upon for this purpose.

Flammable mixtures. A fuel vapor-air mixture cannot be ignited unless the ratio of vapor to air lies within certain well-defined limits, called the "lower" and "upper limits" of flammability, usually expressed in terms of volume percent at atmospheric pressure and temperature. The least concentration (percentage by volume) of fuel vapor in a vapor-air mixture that can be ignited is called the "lower limit" of flammability. The highest percentage by volume of fuel vapor in air in which ignition can be produced is called the "upper" or "higher limit" of flammability. The region between these two percentages is called the "flammable range."

For gasoline vapor this range extends from about 1 percent to about 6 percent by volume of gasoline vapor in air. Mixtures containing less than about 1 percent are said to be "too lean" to burn; they cannot be inflamed by any source of ignition, however intense. Mixtures containing more than about 6 percent are said to be "too rich" to burn. A closed space filled with such a mixture cannot be ignited; but, if allowed to escape into the open air so that further dilution can occur, the issuing mixture can be ignited.

WS. 10. Athletic Field: Fill in the blanks provided on the Work Sheet to make the statement correct. Refer to Illustration Sheet 5, on page 21 to find the correct answers.

When the vapor is mixed with an atmosphere containing more than the normal 21 percent of oxygen, the lower flammable limit is only slightly lowered; but the upper limit is raised, thus broadening the flammable range. With mixtures of fuel vapor in pure oxygen, the range may be as much as seven times that of vapor in air. Conversely, when an atmosphere contains less than the normal 21 percent of oxygen, the flammable range is narrowed. Here, again, the lower limit is only slightly affected, but the upper limit is reduced. At some point, where the oxygen in the original atmosphere is reduced to around 12-15 percent, depending on the diluent gas used, it becomes impossible to produce a flammable mixture with any proportion of fuel vapor. This process of diluting the atmosphere with some gas lean in oxygen (such as nitrogen, carbon dioxide, or flue gas), which will prevent the possibility of the formation of a flammable mixture, commonly, though somewhat incorrectly, is called "inerting."

The flash point test involves the concepts of both volatility and flammable range. Consider a flammable liquid at a temperature so low that the vapor pressure is insufficient to produce, over the liquid surface, an equilibrium mixture within the flammable range. As the temperature slowly is increased, the vapor pressure will rise and the amount of vapor in the mixture above the liquid surface will increase. Until the lower flammable limit is reached, introduction of a source of ignition--such as a small flame--into the vapor space will not cause combustion. When the composition reaches the lower limit of flammability, introduction of a flame will cause ignition and a flame will spread momentarily across the oil surface. This is the method used in the closed-cup flash test. The flash point is the lowest temperature at which the vapor pressure of liquid is just sufficient to produce a mixture at the lower limit of flammability.

Contrary to what the words might seem to imply, "flash point" does not mean the temperature at which a flash appears spontaneously: introduction of a source of ignition is essential. It is also worth noting that increasing flash point temperature is usually associated with decreasing hazard; "high flash point" means low hazard, and vice versa.

There is no generally accepted similar test to determine the temperature at which the vapor composition over a liquid passes out of the flammable range into the "too rich" region. Consequently, temperatures corresponding to the upper flammable limit are not as generally available as those for the lower flammable limit.

The flash point of gasoline, the most commonly used volatile petroleum liquid, is well below zero at atmospheric pressure. Under ordinary handling temperatures, the vapor pressure of gasoline is high enough to produce an equilibrium mixture above the upper limit of flammability. Kerosene and domestic

16427

fuel oils usually have flash points within the range 100-130° F. For industrial fuel oils, the minimum flash point is usually above 130° F. This means that these oils will not usually produce ignitable mixtures over their surfaces unless heated.

Crude oils vary widely in their characteristics and may range from practically water-white liquids more volatile than ordinary gasoline to thick, heavy substances such as asphalt. Therefore, to determine the flammability of any particular crude oil, it is necessary to know its characteristics. So-called refinable crude usually contains sufficient light components to place it in a flash point classification comparable with gasoline.

Ignition sources. In the preceding discussion of the fire triangle, the third requirement for fire was designated simply as a "source of ignition," with the reservation that, for the particular chemical reaction concerned, considerations of both temperature and energy are involved. An ignition source starts the process of combustion. Thereafter, the heat of combustion itself provides the energy for continuation of the reaction so long as proper proportions of the other two ingredients--fuel and air--are available.

A "source of ignition" is actually defined in terms of the result. If fire occurs, then an ignition source must have been present. Other things (like the proper mixture) being favorable, absence of fire proves the absence of the proper combination of temperature and energy to meet the requirement of an ignition source. Different fuel substances have different ignition characteristics, and whether or not ignition can occur is influenced by the factors of the temperature, size, duration, and energy of the potential source of ignition.

Under these circumstances, it is impossible strictly to define an ignition source and equally impossible to assign to any fuel substance a particular ignition characteristic (such as the so-called ignition temperature) that will be an unvarying property under all conditions. Even though a source of ignition cannot be strictly defined, it is still desirable, however, to review in general terms the applicable principles so as to establish a basis for evaluation of practical problems.

The ignition susceptibility of various fuel substances varies widely, depending on physical state, chemical composition, nature of the ignition source, and conditions under which the two are brought together. For gas-air mixtures, ignition is commonly thought of as being an almost instantaneous process, although this is not true under some conditions to be discussed later. Solid substances must usually be vaporized before ignition can occur, bringing in the time element. Also, if the atmosphere contains more than the normal amount of oxygen, ignition is made easier. Although rigid classification is impossible, common fuel substances fall roughly into three groups:

16428

1. Easily ignited--chemically active vapors and gases such as carbon bisulfide, acetylene, and hydrogen.

2. Less easily ignited--hydrocarbon gases and vapors, including all of the products of petroleum together with most oxygen-containing organic chemicals, such as alcohols, ethers, and acetones, which have higher ignition energy requirements.

3. Slowly ignitable at low temperature--cellulose-containing solids, such as paper, wood, and rags, which under long exposure to relatively low temperatures may dry out, char, finally glow, and possibly burst into flame.

Within each group of fuel substances, there are variations in ignition susceptibility, which in turn may vary with the nature of the ignition source. Common sources of ignition are:

1. Flames--All flames, except very tiny ones that can be produced only under controlled laboratory conditions, are sources of ignition.[1] Flames of the shortest possible duration will ignite properly proportioned vapor-air mixtures; continuing flames can also volatize solid or liquid fuels and ignite the vapor released. As mentioned previously, once the chemical reaction of combustion has been started, the heat of the reaction releases the energy (flame that perpetuates the process).

2. Electric sparks--Electric sparks are a well-recognized ignition source. Here, however, practical limitations arise. All electric sparks are extremely hot, but the total energy is subject to extremely wide variation. The fact that a spark is readily visible is not proof that it is capable of producing ignition. The electrical characteristics of the system--open circuit voltage, resistance, capacitance, and inductance--control the energy available. Although the limiting minimum spark energy necessary to produce ignition of some one fuel mixture can be determined for some simple system--for example, a jump spark, where capacitance and length are the only variables--it has not been found possible to relate, other than directionally, the effect of all the variables. These include, in addition to those previously enumerated, the size and shape of the electrodes and their spacing or rate of separation.

   In some electric devices, the total energy available for production of sparks is strictly limited--for example, a hand flashlight or an

[1] J. H. Holm, Philosophical Magazine, 7th Series, 14 (July, 1952), pp. 18-56.

16429

electric tachometer generator--and it is possible by test to determine that for certain atmospheres the device is "intrinsically safe." This means that under no condition of mechanical failure is it possible to produce a spark capable of producing ignition. For a tachometer generator, the most dangerous fire hazard is a short circuit of one of the windings. To establish the factor of safety, the test could include abnormally high speed and the use of a mixture that can be ignited more easily than any mixture liable to be present under service conditions.

In general, all sparks produced by line-powered devices are considered to be incendiary. If desired, however, some line-powered devices can be made intrinsically safe by a combination of steps such as voltage or current limitation and the use of capacitors, rectifiers, Zener diodes, and limitation of rate of electrode separation or gap length. Sparks produced by short-circuiting a few ordinary dry cells will not produce ignition of petroleum vapors.[2] Neither will the sparks produced by interruption of noninductive circuits, even when carrying large currents at low voltage.[3]

Sparks produced by release of charges of static electricity can produce ignition if enough energy is involved. The conditions required to store up sufficient energy to be dangerous cannot be strictly defined, but they are usually associated with large metallic bodies well insulated from the earth (a tank truck on very dry rubber tires) or with extensive surfaces of oil inside tanks.

Ignition by an electric spark requires the release of a certain minimum amount of energy across a gap of optimum length, called the "quenching distance" (about 0.08" for C_2-C_5 hydrocarbons).[4] The energy required increases sharply at lesser distances. The fact that short sparks can harmlessly dissipate a relatively large amount of energy is important in connection with bonding for the equalization of static charges. In many cases, a bond connection can have high ohmic resistance because of rust and other causes; yet it will be

16430

effective even if there is a small air gap, because as the potential builds up, a short harmless spark can occur across this gap, and a longer dangerous spark is prevented.

3. Hot surfaces--Hot surfaces, if large enough and hot enough, are an unfailing source of ignition. It has been shown that, as the area of the surface becomes smaller, the temperature required to produce ignition becomes higher.[5] This refers to the introduction of relatively small heated bodies into a much larger combustible mixture held at ordinary ambient temperature.

   If the heated surface becomes very large, so as to completely envelop the mixture under test, the temperature required to produce ignition (after a lapse of time) becomes much lower. The so-called autogenous ignition temperatures tabulated in numerous publications frequently are determined by methods in which the heated surface completely encloses the test mixture. In such tests, a time lag between introduction of the fuel and appearance of the flame may be as much as several minutes.[6] The temperature obtained might properly be called the "environmental ignition temperature," because it is actually the temperature of the environment at which the oxidation reaction starts, progressing, with self-heating, up to the point at which the flame appears.

   This process is similar to the "spontaneous ignition" at ordinary room temperature in a rag soaked with linseed oil, with the important difference that, for mineral oils, the slow oxidation that produces self-heating and ultimate ignition does not take place until the temperature of the surroundings is raised to a relatively high level. Spontaneous ignition of oil-soaked insulation at a temperature in the range of 600° F is an example. Environmental ignition temperatures are much lower than those obtained by the introduction of a heated body into a large volume of cold mixture or the contact of a drop of liquid fuel with a heated surface in an atmosphere of ordinary ambient temperature. For example, the environmental temperature for the

16431

ignition of gasoline is 478° F,[7] but a hot plate would have to reach 1200° F to ignite a drop of gasoline splashed against it. These figures support the observation that bare pipes carrying hot oil or gases (such as hot exhaust pipes) seldom are sources of ignition, even when they are at a temperature well above the temperatures determined by environmental methods.

Environmental ignition temperature is substantially lowered by an increase in the pressure of as little as five atmospheres. This probably explains in part the internal burning occasionally observed in hot asphalt lines when blown with air.

The above explains why sparks produced by the impact of steel on steel, stone, or other hard substance (dropping tools, for instance) ordinarily will not ignite vapors of gasoline or other petroleum products. The temperature of the sparks so produced is relatively high, but the particles are small and the time of exposure short, and the energy transmitted to any one volume of vapor-air mixture is insufficient to produce ignition. Incendiary sparks can be produced, however, by the impact of large bodies or by high velocity rubbing at high unit pressure (for example, the sliding of some steel part of a vehicle along the pavement as the result of a crash). No sharp dividing line can be drawn between steel objects that produce harmless sparks and those that produce incendiary sparks. In some areas, power tools are arbitrarily placed in the latter category.

These facts, often of little importance, may become very important when a suspected source of ignition in an unexplained fire is investigated. Hasty and incorrect conclusions may result in failure to find the real cause of the fire; a waste of time, money, and effort; and the risk of another fire.

Spread of Flame

In a flammable vapor-air mixture, flame will spread in all directions until the entire mixture is consumed. The rate at which the flame front moves--called "rate of flame propagation"--is subject to wide variation. In mixtures of either low-limit or high-limit composition, in which the reaction is barely self-sustaining, the rate of flame propagation is low--half a foot per second or less--and no significant pressure rise results. Mixtures closer to the center of the flammable range produce more vigorous flames, which spread faster initially and tend to accelerate. The rate is also influenced by the

---

[7] Journal of Research, National Bureau of Standards (July, 1954), pp. 49-66. The addition of lead tetraethyl usually results in a substantial increase in the observed temperature of ignition.

16432

nature of the combustion. Maximum rates of flame propagation, with accompanying maximum explosive effects, occur in mixtures slightly on the rich side.

The bunsen burner provides an example of a type of flame propagation that is industrially important. Premixed air and gas in proportions with the flammable range can be ignited above the burner tube, where the velocity slows because of expansion of the steam, but the flame does not pass down the tube (or "strike back") because the normal rate of flow is higher than the rate of flame propagation in the turbulent mixture in the tube. If the rate of flow is sufficiently reduced, a condition may be reached where flashback can occur.

Earliest attempts to measure the rate of flame propagation employed this method. The flame velocity so obtained depends on the composition of the mixture and, to a lesser extent, on the tube diameter. Velocities determined by this method are reproducible and are free of the variations and uncertainties that accompany rates of burning of mixtures initially at rest in pipes or vessels. Hence, velocities so measured may be used with confidence in the design of burners and in the appraisal of risk of flashback in pipes, certain types of flame arresters, and the like.

In the open, burning a petroleum vapor-air mixture may produce speeds up to about 8 or 10 feet per second, with no spectacular manifestation beyond the

Los Angeles Fire Department

Fig. 3. Showing the principles of vapor drift at a tabletop demonstration.

16433

appearance of the flame and an outward rush of gases sometimes described as a "whoosh." If the burning takes place in a closed space, the heat produces a rise in pressure. If the pressure exceeds the strength of the container (a tank, for example), failure will result, and an "explosion" is said to have occurred. If the container is strong enough (the cylinder of a gasoline engine, for instance), there may be no outward sign at all.

Detonation

In a container that provides opportunity for a long path of flame travel, such as a pipeline or large process vessel, ignition of a mixture capable of producing a fast-moving flame may lead to the development of "detonation." Instead of a layer-by-layer process of flame spread, the energy to initiate flame is transferred, by means of a shock wave, ahead of the flame front to the unburnt gas mixture. Detonation in gas mixtures travels over the speed of sound in atmospheric air, often 6000 to 8000 feet per second, and the sudden release of energy can produce destructuve effects that are many times more severe than the relatively slow pressure rise of ordinary burning.

Detonation is the result of shock waves reflected from the walls of the container; hence it does not develop in flames burning in the open, is unlikely in containers of highly irregular shape, and is favored by containers permitting long, uninterrupted flame travel, such as pipes.

Detonation as used here should not be confused with engine "knock," which is believed to arise from a different mechanism. The difference is illustrated by the fact that tetraethyl lead will not slow down or arrest detonation in a pipe. Detailed discussion of the mechanism of detonation and calculation of detonation velocity and pressure are beyond the scope of this discussion.[8] The tendency to detonate is associated with a high initial rate of flame travel and high energy release per unit volume; and detonation is favored by high initial pressure, oxygen-enriched atmospheres, and such fuels as hydrogen and acetylene.

Mixtures of petroleum vapor and air at high pressure have developed detonation in process vessels and long pipelines. No similar incidents have occurred at atmospheric pressure, probably in part, because under practical conditions it

V; and: The Standing Committee on Combustion Symposia (Bernard Lewis, et al.), Fourth International Symposium on Combustion, Combustion and Detonation Waves (Baltimore: The Williams and Wilkins Company, 1956).

16434

is unlikely that a uniform mixture within the necessary narrow composition range can be present throughout a large space. In carefully controlled experiments, a flowing stoichiometric mixture of natural gas and air has produced detonation in a two-foot diameter pipe, 300 feet long, at atmospheric pressure and below.

Explosion Hazard

From a practical standpoint, determination of the percentage composition of mixtures of flammable vapor with air is of great importance. Mixtures that are too lean to burn do not constitute a fire hazard. If a mixture should be close to the lower flammable limit, however, some concern should be given to the possibility that changing conditions--such as an increase in temperature--might change the composition sufficiently to make it flammable.

Mixtures that are too rich to burn do not constitute a fire hazard. In some cases, however, such mixtures may become diluted with enough air to be flammable. Therefore, the surrounding conditions must be carefully studied to determine whether a potential explosion hazard exists.

Mixtures that are within the flammable range are potentially very dangerous since they require only the presence of a source of ignition to burn or explode. The degree of hazard depends on the volume of the mixture, its location, the degree of confinement, and the likelihood that a source of ignition might occur accidentally. Flammable mixtures in large volume in partially or wholly confined spaces (such as tanks and basements) are particularly dangerous because the force of the explosion may not only destroy the enclosure but also damage adjacent equipment. The likelihood of severe destruction is increased when the mixture is initially at above-atmospheric pressure in a vessel capable of sustaining a proportionally high pressure before failure. The hazard will be particularly acute if men are required to be in, or adjacent to, such structures.

The presence of petroleum vapors in the range from zero to the lower flammable limit readily can be determined by portable combustible gas indicators. The scale of the "J-W" combustible gas indicator, as generally used throughout the company, provided a figure "1" near the upper end, to indicate an explosive mixture; the space between zero and this point is divided into tenths, marked ".2," ".4," and up, to indicate fractions of the lower explosive limit. Thus the safety range of any mixture easily can be determined. Tests of atmospheres within any confined space are usually required before hot work is done or men are permitted to enter. Departmental rules generally prescribe the methods for testing and set limits within which entrance is prohibited. These limits are generally only a small fraction of the lower explosive composition, because breathing richer mixtures might cause discomfort or even have toxic

16435

effects if long continued. In some states legal requirements have been established for hot work and the entry of spaces in which flammable or toxic vapors may be present (for example, State of California Petroleum Safety Orders, No. 6777, 6793, 6810).

A special problem is the determination of the exact composition of vapor mixtures within or above the flammable range. An approximate idea of the composition may be obtained by the use of the combustible gas indicator or a dilution valve or by other special techniques, but precise knowledge of the flammability of rich mixtures or those containing "inert" gas must be derived from laboratory analysis or direct explosion test. The need to know the exact composition of mixtures above the lower flammable limit seldom arises. All such mixtures must be considered potentially dangerous because of the possibility that dilution might bring them within the flammable range, which depends more on the source of vapor and the physical surroundings than it does on the original composition.

16436

UNIT III — ELECTRICAL DRAFTING

General Information

Electrical Drafting:

The result of electrical drafting is the schematic drawing. The "schematic" is to the electronic engineer or technician the same as a road map is to a motorist in a strange country. It can show how to wire a house, construct a radio, or trace the ignition on an automobile. Constructing and servicing electrical appliances would be impossible without electrical drafting.

Each symbol on the "schematic" represents an electronic part, and shows exactly how it is connected into the circuit.

The drawings included in this unit will introduce you to some of the terms and symbols used in this field of drafting.

It will be necessary for you to become familiar with the symbols given on Illustration Sheet 6, page 29. You will also want to know the definition of and be able to spell the following words:

a. electronic	f. transistor
b. schematic	g. current
c. technician	h. condensor
d. symbol	i. resistor
e. circuit	j. antenna

Examples of the use of the data in Table 3 are:

1. About how much liquid butane is needed in an empty 1000-gallon butane tank to make the atmosphere explosive?

   The table shows that the lower flammable limit of butane is 2 percent; therefore, the tank should contain 980 gallons of air and 20 gallons of butane vapor. The table shows that 1 gallon of liquid normal butane produces 238 gallons of vapor. The minimum amount of liquid required would be 20/238, or about 1/10 gallon, or roughly 1 pint of liquid.

2. Gasoline is not shown in the table because it is a mixture, not a pure compound. Its lower flammable limit is about 1.4 percent and its liquid-vapor ratio is about 1:200. With these data the minimum volume of liquid gasoline, fully vaporized, would be about 14/200 × 1 gallon or 1/15 gallon--or less than that for butane.

3. Assume there has been a severe explosion in a 5000-gallon gasoline tank. How much liquid gasoline is needed?

16437

A severe explosion would call for a vapor concentration in about the middle of the flammable range, or about 5 percent vapor. Five percent of 5,000 gallons would be 250 gallons of vapor or 1.3 gallons of liquid, assuming the entire amount vaporized and filled the tank uniformly with the 5 percent mix. However, it would not be necessary completely to fill the tank with this mixture to cause a severe explosion. If the vapor stratified near the bottom and a blanket of 5 percent mix located near the source of ignition, less than 1.3 gallons would be needed. It should be evident that precise calculations are impractical when various assumptions are involved. Approximate results, however, may be of value.

Some of the data in the table have no practical application for the average reader; they are included only for comparative interest. For example, liquid hydrogen is only 7 percent as heavy as water.

16438

3 STATIC ELECTRICITY AND FLAMMABLE LIQUIDS

Oliver W. Johnson
Standard Oil Co. of California

Static electricity has no direct bearing on fire fighting, but it is important to fire prevention concerning flammable oils and gases. To most people static electricity is a mysterious, and often misunderstood, subject. Very little has been written about it in layman's language.

The following paper was prepared by an expert in the petroleum industry who has had much practical experience with problems of static electricity. His paper covers both theory and practical application, and it is written in non-technical language. Those who wish to study the subject further may write to Director, Division of Science and Technology, American Petroleum Institute, 1271 Avenue of the Americas, New York 20, New York, to obtain a copy of the API Manual RP-2003, Protection Against Ignition Arising Out of Static, Lightning and Stray Currents, $1. The NFPA Pamphlet 77M "Static Electricity," $1, is excellent. (The present paper is a revised reprint from the manual of the 1961 Bakersfield Oil Fire Control School.)

To the average person the term "static electricity" means either a noise in the radio receiver that interferes with good reception or an electric shock that is experienced after walking across a carpeted floor or sliding across the plastic seat cover in an automobile. Some women wearing wool, silk, or synthetic fiber garments also may hear mysterious crackling noises and notice a tendency for some of their clothing to cling. Most people recognize that these phenomena occur mainly when the atmosphere is dry. They are simply annoyances.

Safety and fire protection engineers have a much more than superficial interest in the occurrence and properties of these sparks, which frequently are blamed for fires and explosions. They are concerned because, if static electricity actually causes fires, they should know how to prevent them. But, if static electricity does not cause fires, they should know this in order to locate and correct the cause.

Terms and Definitions

The word "electricity" is derived from the ancient Greek word "electron," meaning "amber," because it was with amber that the phenomenon of electrification first was observed. For centuries the word "electricity" had no meaning other than "the property exhibited by some substances of being able to attract or repel light objects after being rubbed with a material like silk

16439

or wool." In recent times, when the properties of flowing electricity were discovered, the word "static" came into use as a means of describing the first type of electricity.

Without attempting to be technically precise, we may say that electricity behaves as though it were an imaginary, weightless, and indestructible fluid, which can flow freely through some substances (such as metals) that we call "conductors," but which can flow with difficulty or not at all through or over the surface of a class of substances called "nonconductors" or "insulators." The latter group includes most gases, glass, rubber, amber, resin, sulfur, paraffin, and most dry petroleum oils. When electricity is present on the surface of a nonconducting body, where it is trapped or prevented from escaping, it is called "static" electricity. Electricity on a conducting body that is in contact only with nonconductors also is prevented from escaping and can be said to be "static." In either case the body on which this static electricity is present is said to be "charged." The implication that static electricity always stays at rest is, of course, erroneous; it is when static electricity finds a means of escape and is discharged that it causes the most concern to fire protection personnel.

A "charge" may be either positive or negative. At one time it was thought that there were two kinds of electricity, positive and negative, and that in a neutral (uncharged) body they were present in exactly equal amounts. Instead of there being two kinds of electricity, however, there actually are two kinds of particles in an atom. The negatively charged particle is called the "electron"; in electric conductors this particle is only loosely bound in the atom and it is therefore free to move from one atom to another. The positively charged particle is called the "proton"; this is a part of the atomic nucleus and therefore does not move among atoms. When there is an excess of electrons in any atom, that atom has a negative charge; when an atom has lost electrons, so that there is a deficiency, that atom has a positive charge.

A charged body, then, is one in which an electrical imbalance exists. The charge resides on the surface. On a conductor the charge is free to migrate over the surface and does so under the influence of charges on adjacent bodies. Like charges repel; unlike charges attract. On a nonconductor the charge is not mobile. If the body were a perfect insulator it would remain indefinitely. As a practical matter, a charge on the surface of a nonconductor remains only a portion of an hour at most, because no insulator is "perfect." Even the air exhibits a very slight conductivity.

Electricity is a form of energy and may be produced by expenditure of energy in some other form such as mechanical energy, chemical energy, heat, or visible radiation. Likewise, when electrical energy is expended, its equivalent appears in one or the other of these same forms.

16440

Static electricity, then, is an electric charge on the surface of an insulator or an insulated conducting body. It is "generated," usually, by the expenditure of mechanical work, although it must always be remembered that in this sense "generated" means "liberated" or "made alive"; electricity cannot be created.

Since electricity cannot be created but can only be moved from one substance to another, it follows that in any system the total quantity of electricity is constant, and that the sum of all positive and negative charges is zero. For every (+) charge there must be somewhere, as close as the conditions will allow, enough free electrons to make up an equal and opposite (-) charge. This concept of equal and opposite charge is extremely important.

The "generation" of static electricity is a mechanical separation of charges. When two bodies are in contact, the distribution of electrons at the contact surfaces is likely to be unequal, and a certain attractive force exists between the surfaces because of this unbalanced distribution. When the surfaces are separated, work is done in opposition to these attractive forces, and the work appears as an increase in the electrical tension, or voltage, between the two surfaces. If a conducting path is available, the charges thus separated will immediately reunite. If no such path is available, the potential may easily build up to several thousand volts.

Practically, static electricity is generated by contact and separation of two bodies, at least one of which usually is an insulator. Some examples are the rolling of rubber tires along the pavement, the flow of oil through a pipeline, the rubbing of dry shoes on a carpet, and the like. Under most conditions the creation of a static potential immediately sets up a flow of current; the separated charges flow back together, following any and all available conducting paths. If the resistance of the path is high enough, however (that is, if the two bodies on which the charges reside are highly insulated, one from the other), a potential of several thousand volts may develop before the discharge rate equals the rate of generation. Under these conditions the potential may become high enough to produce a visible spark if the two bodies are brought close together, or if some conducting body partially bridges the gap between them. Such sparks may be an ignition hazard if they occur in the presence of the vapors of a flammable liquid in ignitable concentration.

Control of Hazard

Three things are necessary in order that static may produce a hazard:

1. A generating mechanism.
2. An insulated conducting body to serve as an accumulator.
3. A discharge path, including a spark gap at a point where combustible vapors may be present.

16441

The generating mechanism is inherent in many operations, such as the transfer of oil, and cannot be avoided; and the presence of the possible discharge path may be beyond reasonable control. Therefore, practical measures for minimizing static hazard usually place emphasis on avoiding the presence of an insulated body on which a charge might accumulate. This can be accomplished by making sure that all bodies in the path of possible flow of static electricity are electrically interconnected.

The word "bonding" usually is employed to describe the connection of a conductor between two bodies for the specific purpose of reducing the electrical resistance between them. Bodies or structures are "inherently bonded" when they are, by the nature of the installation, connected with an electrical path having a resistance low enough to prevent the accumulation of dangerous static charges. A "ground" is the special case of a bond, one end of which is connected to the earth or to a body in contact with the earth. If each of two bodies is grounded, the two are in effect bonded together. It should be noted that here the importance of the connection to the earth is incidental. If the two bodies are electrically connected, such as when a bond is used to connect two vessels between which oil is being transferred, building up a hazardous potential difference between the two vessels will be prevented--whether or not the containers are grounded. At other times a charge might build up on a body insulated from the earth (the equal and opposite charge residing on the earth itself), and a ground connection is the bond that provides a path for the dissipation of the charge.

Practical Considerations

Although manifestations of static electricity are fairly common in everyday life, most of these arise under circumstances that constitute only a petty annoyance and involve little or no hazard.

In the petroleum industry the generation of static electricity by transfer of products is unavoidable. The ability of different products to generate static electricity varies widely and uncontrollably. However, the presence of static electricity can be a hazard only where some flammable vapor is present. Experience shows that static is a hazard in few circumstances:

1. In pouring flammable liquids from one container to another--If both of the containers are of metal, a difference in potential may develop between them; and if the spacing is not too wide, or a conducting body partially bridges the gap, a dangerous spark may result. A simple remedy adequate for most circumstances is to keep the two containers in metallic contact during the transfer. When only one of the containers is metal, the hazard is much reduced, although it is still possible for the metal container, if insulated, to accumulate a dangerous

16442

potential with respect to its surroundings. This condition may be avoided by placing the container in some conducting surface so that any charge delivered to it is equalized with the surroundings. When both containers are nonconductive, the electrostatic capacity is so low that it is almost impossible for dangerous sparks to result.

Fig. 4. Bonding while filling containers. If both containers are resting on a metal plate to provide inherent bonding, no bond wire is needed (right).

Fig. 5. Bonding while filling container. Metal strips fastened to the floor and bonded to the fill pipe serve as an inherent bond. If the fill nozzle maintains firm contact with the barrel head, no other bonding is needed.

2. In filling or emptying tank vehicles supported on rubber tires--Under some circumstances the generating mechanism can produce a potential difference between the vehicle and the supply piping that can become highly dangerous. In wet weather, rubber tires are sufficiently conductive to prevent dangerous charges, but in dry weather a vehicle so filled can accumulate a high potential unless some conducting path is provided. When vehicles are filled through open domes (the fill pipe either nonconductive or not touching the tank) sparking may occur at the opening where vapor is present unless some deliberately applied "bond" connection is made between the fill piping and the vehicle to provide a path over which the separated charges

16443

3. In tank filling--Pumping a petroleum product through a pipe can produce a charge of static electricity within the liquid, an equal and opposite charge being left on the pipe. As soon as the liquid comes to rest in a container, the charge tends to migrate toward the vessel walls and also toward the upper surface of the liquid. The rate at which the charge reaches the wall, where it is neutralized, depends on the conductivity of the liquid. The charge that reaches the surface cannot escape so readily, and in extreme cases the surface voltage may build up to a point where a spark may jump across the surface to the vessel wall. Such "surface charges" cannot be prevented by any process of bonding or grounding. Fortunately, the conditions that produce dangerous charges by this means seldom occur. Since the rate of charge generation is roughly proportioned to the velocity (rate of pumping), a precaution sometimes followed is to employ slow pumping rates at the start of filling. Agitation, which seems to assist in bringing the charge to the surface, will thereby be reduced.

A somewhat similar condition can result when a petroleum liquid in a tank is agitated by bubbling air through it, or by propellers, or even by filling through an overshot line. The effect will be intensified if water or chemical solutions are present. The mechanism of possible spark discharge is as previously described, and "grounding" the tank can have no influence either on the generation of static sparks by this means or on any hazard that may be associated with it. The only way to prevent this type of generation of static electricity is to avoid the agitation. The charge can be prevented from becoming dangerous by limiting the surface area on which it can accumulate. Experience has indicated that dangerous static sparks are unlikely in tanks with diameters under about 10 feet. Other methods of control are to eliminate the vapor space above the oil surface by using a floating roof or to inert or to use other equivalent means to insure that an ignitable mixture is not present.

Bonds

It has been emphasized that a static charge can accumulate only on a highly insulating surface or on a conducting body completely insulated from its surroundings. It is difficult to appreciate the high degree of insulation necessary to prevent escape of a static charge. All common concepts based on experience with electricity from batteries or power sources must be discarded, not because electricity from different sources is different, but because of the vast difference in the quantity involved and the voltage available. Ohm's law applies, but the magnitudes involved are unfamiliar.

In tests made at California Institute of Technology, Dr. S. S. Mackeown found that, while filling a tank truck with gasoline at 800 gpm, the rate of current generation was less than one-millionth of an ampere. With currents at this

16445

magnitude and voltages up in the thousands, a static charge will leak away as fast as generated if there is any path available having a resistance lower than a few hundred or thousand million ohms. Insulation to this degree can be achieved only with extreme care and special materials. Objects permanently resting on the earth are likely to have a resistance to the ground of very much less than this, and hence will be immune from the accumulation of a dangerous static charge.

Summary

1. Static electricity will be manifest only where highly insulated bodies or surfaces are found.
2. If a body is charged with static electricity there will always be an equal and opposite charge somewhere in the vicinity.
3. If a hazard is suspected, the situation should be analyzed to determine the location of both charges and to see what conducting paths are available between them.
4. Tests of the resistance of possible conducting paths should be made with an applied potential of at least 500 volts. Resistances below about 10,000 megohms will provide an adequate bond in many cases.
5. Where artificial bonds are applied, they should connect the bodies on which the two opposite charges are found; connection to the earth is incidental.

16446

Transistor Receiver:

During recent years many inventions have been made in radio receiving. One of these has been the use of transistors in the place of electron tubes (radio tubes). Transistors use less electrical current and generate less heat. For this reason transistor receivers can have smaller batteries and smaller, lighter cases.

4 SPONTANEOUS COMBUSTION

C. H. Van Marter
Union Oil Co. of California

Spontaneous combustion is another subject that sometimes is misunderstood, and hence is included in this manual. As stated in the following paper, vegatable and animal oils are the prime offenders; pure mineral oils are not subject to spontaneous ignition in the same manner. You may ask, therefore, "Why is this paper included in a manual about petroleum oil fuels?" The reason is that paints and paint oils commonly are used in the petroleum industry, and fires have started from the spontaneous combustion of paint rags and have destroyed oil property.

The subject of spontaneous combustion is included to round out the fireman's knowledge of fire prevention. Because this book can serve as a reference text as well as a training manual, this brief discussion may prove useful. (It is a revised reprint from the manuals of the 1955 and 1961 Bakersfield Oil Fire Control Schools.)

The Combustion Process

"Combustion," according to the dictionary, means "oxidation or the combining of some substance with oxygen accompanied by the evolution of heat." Everyone is acquainted with two common forms of combustion: rusting and fire. In the rusting of iron and, similarly, in the drying of paint, oxidation occurs, but it takes place so slowly that the heat that is given off is carried away by air circulation, and therefore, there is no temperature rise. In the case of fire, however, oxidation occurs so rapidly that not only heat but also light is given off.

Between these extremes spontaneous combustion lies. In spontaneous combustion, oxidation is occurring, and heat is being given off. Usually, however, air cannot carry away the heat because of insulation or poor circulation. Thus, a paint-soaked rag lying in the bottom of a locker may undergo spontaneous combustion. No more heat is being given off than would be given off by the drying of the same quantity of paint on a wall; but because air is unable to circulate and carry away the heat, the temperature rises. In some cases the temperature rises only very slightly, and no damage results. In other cases the temperature may rise to such an extent that the rag is charred. In extreme cases the temperature may rise to such a point that the rag actually catches on fire. When this does occur, we say that the material has been spontaneously ignited.

16447

Paints and Paint Oils

A great many substances can induce spontaneous heating or spontaneous combustion and may even result in ignition. In this connection vegetable oils and some animal oils are particularly dangerous. Since these oils are used to a large extent in paint, the following suggestions are presented for the guidance of those who use paints and paint oils:

Housekeeping. Whenever any painting is done, care should be taken that all rags are properly disposed of and all paint cans are capped tightly after use.

Los Angeles City Fire Department

Fig. 8. Ingredients of spontaneous combustion.

16448

Disposal. The proper disposal for paint-covered rags and clothing is either to burn them in an incinerator or to place them in a fireproof container, such as a metal trash can with a tight-fitting cover. They should never be dumped into the general trash can, because they are likely to ignite other materials.

Storage. A separate storage space should be chosen for paint cans. If possible, this should be a shelf with a rim or bead at the front to prevent their falling to the floor. All cans should be closed tightly and stacked no more than one can high. Under no circumstances should rags, trash, excelsior, cartons, and other ignitable items be stored on or underneath the paint shelf.

Closed lockers are not the best for storing paints, for these lockers often serve as catch-alls for other miscellaneous materials and add to the fire hazards unless particular care is taken to insure that the locker is used only for paints. If paints are stored on open shelves, any poor housekeeping is evident to anyone passing by; and therefore, the storage is more likely to be maintained safely. Some plants, however, have old steel truck lockers that are used effectively for paint storage, and these are acceptable.

It is safer not to store paints in areas closely adjacent to warehouses containing large quantities of readily combustible mineral oils. Paints should be stored in cool places where the cans will not overheat and pop off their lids. Paint oils should not be stored in glass containers.

Brushes. Brushes used for painting should be thoroughly cleansed. It is not necessary to use high-priced paint oils, turpentine, or solvents for this purpose. It has been found that stove oil makes an excellent brush cleaner and leaves a film of mineral oil on the brushes that keeps them soft and serviceable for future use.

Commercial Mineral Oils

The regular commercial lines of mineral oils are not subject to spontaneous ignition. However, mineral oils, oily rags, and oily trash will greatly accelerate a fire. Good fire protection demands good housekeeping for all such materials.

16449

5 USING WATER ON OIL FIRES

Oliver W. Johnson
Standard Oil Co. of California

The following paper was presented at the 1961 Bakersfield Oil Fire Control School, but copies were not available to include in the manuals distributed at the school.

Although the paper contains some technical discussion, it presents the subject clearly with much information of value to firemen. Study it carefully.

Ever since the days of the bucket brigade, water has been recognized as the principal agency for the control of accidental fires. The grading schedule of the National Board of Fire Underwriters gives 75 percent of the credit to water supply and equipment for the use of water. Without such facilities, no city could possibly achieve a rating above Sixth Class. In the NFPA Handbook of Fire Protection, nearly half of the space is devoted to discussion of water sources, distribution systems, and equipment used for applying water. Most fire department training devotes much time to teaching how to pump and handle water, how to apply it to a fire, and how to prevent damage when excess water gets to places not intended or desired.

Water is the basis for the control of the type of fire that occurs in what are loosely termed the "ordinary combustibles"--the materials of building construction and the objects of fabric, wood, paper, and similar products that surround us in our daily lives. But how about the use of water on fires in flammable liquids--specifically, the products of petroleum?

Once we often heard, "Never put water on an oil fire," but we know now that water is the best and most effective agent for controlling oil fires. Compared with the use of water on structural fires, there are differences in methods and results, which will be discussed. First, however, consider the role of water in controlling the "ordinary" fire.

Water as a Cooling Agent

Water is said to be pre-eminently a cooling agent. In an article by E. A. Hibbitt, Senior Fire Prevention Officer, Fire Brigade, Manchester, England,[1] the following appears:

---

[1] E. A. Hibbitt in Fire Research Abstracts and Reviews (September, 1960).

16450

> Water has always been the principal medium used for fighting fires, and it is unlikely that it will be superseded in the forseeable future. Water is cheap, usually plentiful, and has the highest specific heat of any known substance, which gives it remarkable cooling properties. The difficulty has always been to find the best method of using it.
>
> Theoretically, the ideal way to extinguish a fire with water is to use exactly the right quantity, which in vaporizing will absorb sufficient Btu to cool the burning substance below its ignition temperature. If this could be achieved, the danger of damage by water to valuable commodities untouched by the fire would be eliminated.

Mr. Hibbitt goes on, under the heading of "The Arithmetic of Fire-Fighting," to show that the rate of heat release is likely far to exceed the rate of heat absorption of all the water that it will be practical to apply.

Much the same thought is expressed in an article by S. D. Klinger:[2]

> As a corollary to the principle of finding the fire and hitting it with water, it might be added that even though you are hitting the fire, it cannot be extinguished unless the cooling effect of the water exceeds the rate at which the fire is producing heat.

In both of these quotations the underlying idea is to relate the cooling effect of water to the heat release in the fire. This relationship will be developed in more detail. Since the properties of water are more familiar, the cooling effects of water will be explained first.

It is obvious that if equal quantities of hot and cold water are mixed, the resulting mixture will have a temperature between the two initial temperatures. The water at the lower temperature absorbs heat from the hot water and "cools" it but is itself heated up in the process. The amount of heat required to heat one pound of water by 1° F is called a "British thermal unit," abbreviated "Btu." This term is used in engineering calculations in the U.S.

Since water used for cooling must be heated, the number of degrees by which its temperature is raised is a measure of its cooling effect. If a stream of water at 62° F was used to cool a hot object, and all of it ran off at exactly 212° F, the total amount of cooling effect would be 212° F minus 62° F or 150 Btu's per pound of water used, or 150 × 8.34 = 1251 Btu per gallon of water applied.

---

[2]S. D. Klinger, "Make Better Use of Men and Equipment," Firemen (February, 1961).

16451

When water is applied to a fire, at least some of it is converted to steam, and in this process it absorbs a much greater amount of heat. The relative heat quantities involved are tabulated below. You see that boiling a gallon of water absorbs almost six times as much heat as is taken up in heating it from 62° F to the boiling point.

TABLE 4
Water as a Cooling Agent

Heating Operation	Heat Absorption, Btu	
	Per Lb.	Per Gal.
Heat 62° F to 212° F	150	1250
Boil at 212° F	970	8080
TOTALS	1120	9330

The maximum cooling effect of water applied in fire fighting would be achieved if all of the water was converted to steam and none of it ran off. The location of the seat of the fire and many other factors combine to make it difficult to achieve this ideal efficiency in the use of fire fighting water. When the runoff feels barely warm to the touch, it is apparent that, for some reason, most of the useful cooling effect of the water has been wasted. Often, through a change in technique, the water can be used more effectively.

The Rate of Heat Release

Now to turn to the other half of the question: the rate of heat release. Both of the authors just quoted have concluded, in effect, that, to extinguish a fire, it is necessary to apply enough water to absorb all of the heat produced by the fire, as fast as it is released. The writer cannot agree with this conclusion, for reasons that will be explained later. Before analyzing this, however, consider the matter of the rate of heat release in a fire. You may say that this is a profitless subject--that it is impossible to estimate how fast a fire will burn; that the rate depends on too many unknown and variable factors; that there is no sense in trying to make calculations because in any actual fire the best approach is to put on all the water you can as fast as you can.

Probably you are right to a great extent--the brute force method has worked many times and will continue to be successful in many cases. It may be possible to demonstrate, however, that there is a great deal to be gained by considering the maximum probable heat release from a fire and that this approach will have great usefulness in explaining some of the characteristics of oil fires.

16452

The "heat release" from a fire--in other words, the rate at which the fire burns--obviously depends on a number of factors. As one extreme, consider a jet of gas released from a pipe and burning in the open. The rate of burning depends primarily on the rate at which the gas is escaping. In the surrounding atmosphere there is an unlimited supply of oxygen and--except for the small amount of carbon that escapes combustion and appears as smoke--all of the fuel burns as fast as it is released. The size of the flame adjusts itself on the basis of the rate at which the oxygen from the surrounding air can reach and mix with the gas. A big gas release produces a big flame; a small release produces a small flame--because the air supply is not the controlling factor. When a fire starts inside a closed building, however, the situation may be quite the opposite. Here, there is probably a large quantity of material that can burn. But because there is a limited access of air, a fire within a building or other enclosure may develop slowly until the breaking of windows or a structural collapse augments the air supply and permits the rate of burning to accelerate.

To assess the value of water in absorbing the heat of a fire, it is necessary to know how fast the heat is being released. It is somewhat surprising that this subject has not been investigated more completely. Although no single figure applies to all cases, some order-of-magnitude figures are of interest.

The NFPA Handbook of Fire Protection does not, at first glance, appear to be of much help. Under the heading, "Quantity of Fire," it states:

> There is not in use any generally accepted method of measuring quantity of fire, as distinguished from its severity. Measurement in terms of Btu's per minute has been suggested, but has not been used except for a few specialized applications.

Although this statement might appear to discourage further consideration of the subject, the discussion of fire loads in the pages that immediately follow gives an interesting approach to the problem. Time-temperature plots are given of the actual burning of six different structures, including an office occupancy, a record storage vault, a household furniture storage, and a dwelling. These were full-scale tests. The total fire load, or amount of combustible material per square foot, is given in each case. By noting the period of time during which combustion proceeded at the most rapid rate, as indicated by the temperature curve, it is possible to make a fair estimate of the rate at which the fuel substance was being consumed and hence also the rate of heat release. The estimated rate of fuel consumption in all six fires averaged between .30 and .46 pounds per minute per square foot, amounting roughly to a heat release of 3000 Btu per minute per square foot of building area. This is an average figure that prevailed over periods of 30 to 60 minutes; the peak rate must have been several times higher.

16453

Another basis for estimating the rate of burning of a solid fuel is available in the tests of the furnaces of steam boilers. Here the rate at which fuel is supplied is known, the area of the grate on which the fuel burns is known, and the air supply is adequate. Even though boiler furnaces vary greatly in size and shape, the results of numerous tests fall into a fairly consistent pattern. In one textbook the results of tests of some 30 different boilers are tabulated. The lowest rate of heat release was 2000 Btu per minute per square foot, and the highest, 20,000 Btu per minute per square foot; but the great majority were around 12,000 Btu per minute per square foot of grate area. This is four times the average figure derived from the tests on the burning of actual buildings. This ratio seems quite reasonable in view of the ample and controlled air supply in a boiler furnace as compared to a partially enclosed building; it is about the same as our estimate of peak rate for structures.

Another interesting source of information is the rate of burning of flammable liquids in open-top containers. In addition to practical experience that has been acquired in actual fires of large size, a great amount of laboratory work has been done in this area, mostly with petroleum oils. It has been determined that, for any one fuel, the rate of burning per square foot of surface remains substantially constant as the area increases above some minimum size--usually only a few square feet in area. Also, the burning rate is influenced by the kind of fuel and, for outdoor fires, by wind and other factors. Nevertheless, the range of rates observed is fairly narrow--about 5 to 18 inches per hour, and a figure of 12 inches per hour for gasoline will be a good average or a little high. By simple arithmetic, one foot per hour is 1/60 of 1728 or 28.8 cubic inches per minute per square foot, or 1/8 gallon per minute per square foot. This last figure is easy to remember and can be useful in several ways, which will be discussed later. One-eighth of a gallon per minute per square foot is equal, for an average oil, to a heat release rate of 14,000 Btu per minute per square foot.

The three heat release figures just discussed are given in Table 5. It is readily seen that there exists an indication of how fast a fire burns. The next question is how this information can be usefully applied.

TABLE 5
Rates of Fuel Consumption and Heat Release

Type of Fire	Lb./Min./Sq. Ft.	Btu/Min./Sq. Ft.
Structural Fire, Average	.4	3,000
Structural Estimated Maximum	1.6	12,000
Furnace, Coal-fired	.9	12,000
Oil Fire, Open Tank	1.0 (1/8 gal.)	14,000

16454

Extinguishing Oil Fires

If extinguishment were to depend, in fact, on the removal of all of the heat of combustion by fire fighting streams, the quantities of water needed could be easily computed, as shown in Table 6. Even casual inspection, however, shows that these figures are unrealistically high. A fire building 50 × 100 feet would need over 5000 gpm. Remember, these figures assume that all of the water would be used. You have seen extinguishment with much smaller water rates, even with a large runoff.

TABLE 6
Water Required to Absorb Total Heat Release of a Fire

Type of Fire	Btu/Min./Sq. Ft.	Gal./Min./Sq. Ft.	
		Heat 62 -212 F	Heat and Boil
Structural	3,000	2.4	0.32
Structural	12,000	9.6	1.27
Furnace	12,000	9.6	1.27
Oil	14,000	11.2	1.50

In spite of the two references that are quoted, it is apparent that the "total heat" theory of extinguishment must be abandoned. Extinguishment from a slightly different point of view--one that will bring us closer to the main subject of oil fires--will now be discussed.

Ordinary combustion. First, consider the actual mechanism of combustion. The NFPA Handbook states:

> In the burning of most substances, the actual combustion takes place only after the solid or liquid fuel has been vaporized or decomposed by heat to produce a gas, and the visible flame is the burning gas.[3]

It naturally follows that anything that interferes with the transfer of heat to the as yet unvaporized fuel will interfere with the process.[4] (This is implied, but not explicitly stated in the Handbook.)

When water is applied to a fire in wood or other similar combustible, its principal effect is to cool off the unburned wood, stop the evolution of vapor

---

[3]NFPA Handbook of Fire Protection, p. 93.

[4]Ibid., p. 99.

16455

from it, and thus starve the flame that feeds upon this vapor. Later, of course, it can quench the red-hot embers to result in complete extinguishment. The fire is stopped at its source because the material on which it feeds (the vapors from the heated wood) ceases to be given off.

Certain oils burn in the same way. Consider heavy fuel oil, lubricating oil, or asphalt. None of these produces vapor in a significant amount until heated to a high temperature. This is why they are said to have a high flash point. But, if a fire is once started by combustion of some other material close by, the oil will give off enough vapor to burn. Once started, the supply of vapor is maintained because the flame continues to supply heat to the oil surface to create more vapor.

If no preventive steps are taken, the fire will continue until the fuel is consumed. However, if water (preferably in the form of a light spray) is applied to the surface, the surface will be cooled down, the release of vapor to feed the flame will cease, and the fire will presently be extinguished.

Thus, for fire in some kinds of oil, water is well suited for extinguishment and accomplishes extinguishment in much the same way as it does with wood or other ordinary combustibles--by cooling the material to the point where vapors are no longer given off. For nonvolatile or "heavy" oils, cooling is a means of shutting off the vapors that feed the fire.

Fires in heavy oil. For fires occuring in heavy oil, the data in Tables 6 and 7 give the basis for estimating the theoretical quantity of water required to effect extinguishment by interrupting the fuel supply. It was seen that the total heat released of 14,000 Btu per minute per square foot was produced by burning 1/8 gallon per minute per square foot. The latent heat of vaporization of oil is around 800 Btu per gallon, so it would take only about 1/8 of this, or 100 Btu per minute per square foot of fire area, to produce the vapor to achieve this burning rate. You will note that this is only a very small fraction of the total heat release of 14,000 Btu per minute per square foot. If a way could be found to intercept this small amount of heat so that it could not reach the oil surface, vaporization would cease and the fire would go out.

If the oil should have a boiling point above 212° F, any water reaching the oil surface would boil preferentially, and would exert its maximum possible cooling effect. Even if the water was heated to 212° F in passing through the flame, all that reached the oil surface would still be capable of absorbing nearly 8000 Btu per gallon. Thus, it would require only that 100/8000 or 1/80 of a gallon per minute per square foot to actually reach the oil surface to accomplish all of the desired cooling, and thus extinguish the fire. This is .012 gallon per minute per square foot. These figures are summarized in Table 7.

16456

ILLUSTRATION SHEET 6.

1643

TABLE 7
Water Required to Absorb Heat from Flame--Exposed Surfaces

Type of Fire	Gpm/Sq. Ft.		
	Theoretical Heat 62-212° F	Boiling Point At 212° F	Practical Rate
Oil Surface 100 Btu/Min./Sq. Ft.	.08	.012	.10
Tank Shell 330 Btu/Min./Sq. Ft.	.26	.04	.20

When considering a fire in a heavy oil, with a boiling point above 212° F, you will see that theory suggests that water applied at rates that are wholly practical should be effective. Naturally, only a part of the water will reach the oil surface, and the total quantity used will be somewhat greater than, but still far below, that required by the total heat theory.

However, with the class of flammable liquids that is called "light," or "volatile," NFPA Class I and II, a different situation prevails. These oils give off sufficient vapor to burn at ordinary temperatures. Any water reaching the oil surface will not boil; it will probably sink to the bottom without being greatly heated; hence its cooling effect is negligible. The principal effect that it will have will occur within the flame itself, where any small drops can, of course, be vaporized to remove heat. But this means fighting the flame, not the fire. The figures just shown indicate that vastly greater quantities of water will be required if the "total heat" is to be absorbed.

In general, water is ineffective as an extinguishing means on fires fed by gases or vapors from volatile oils. However, there are other important functions that water may perform, to be covered later.

Special considerations. The discussion so far is intended to demonstrate that oil fires basically are the same as ordinary fires. There are, however, some important differences, which arise from the following:

1. Since oil fires usually occur in the open, the rate of heat release may be higher than in a building where access of air is restricted.
2. Oil can flow from one place to another, whereas a structural fire usually "stays put."
3. Since oil floats on water, the act of applying water in an attempt to control the fire may introduce complications, which are discussed below.

16457

Consider what will happen if, as a result of an accident, a pipe is broken, and gasoline leaks out at the rate of, say, 10 gallons a minute. Assume that this gasoline is ignited immediately. The fire area will be small at first, but it will speedily enlarge until the area is sufficient to consume all of the fuel just as fast as it escapes. From the figures previously given, the burning rate is 1/8 gallon per minute per square foot, or 8 square feet for each gallon per minute. A leak of 10 gallons a minute will produce a fire area of at least 80 square feet. This is equivalent to an area 4 feet wide by 20 feet long, and if the terrain is such that the flow tends to follow this pattern, the fire will approach this area and then cease to expand. It will continue to burn, occupying about this same area, so long as the rate of fuel supply is maintained. It can grow no larger because the fuel burns up as fast as supplied. It will not grow smaller because just this much fire area is required for access, heat transfer, and vaporization to balance the feed rate. This situation leads us next to the question of what will happen if a water stream is applied.[5]

Some of the water will be in small drops even if a straight stream is used. Some of the small drops will be evaporated to absorb heat from the flame, thus slightly decreasing the rate of heat transfer to the oil surface. The water that reaches the surface will cool it slightly, decreasing the rate of vapor release. Both effects will be to decrease the burning rate per square foot. Since the fire is being fed at a constant rate, the fire (if the terrain permits) will expand its area to make up for the decreased burning rate. The fire will spread. Of course, if it is so restrained that it cannot spread, the level will rise until the enclosing walls cease to contain it.

Remember, this is a gasoline fire. Most of the water used on such a fire sinks beneath the oil, floating it so as to raise the level; this also will tend to make it overflow any existing restraining walls. The oil may flow to a new place, but it cannot burn any faster than the rate of fuel supply or any slower than the rate at which heat transfer releases vapor from the oil surface.

To conclude this part of the discussion, it may be said that water is an extinguishing means for fires in "heavy" nonvolatile oils and that it cannot extinguish a fire involving gas or light volatile oils, except under highly unusual circumstances.

Cooling with Water

The use of water to keep cool or "protect" objects exposed to flame is known to every fire fighter. Wood structures will ignite and burn if exposed to flame

---

[5]This was demonstrated in the field at the Bakersfield Oil Fire Control School in 1961, but with the use of less than 10 gallons per minute of fuel. See p. 161.

16458

or even to intense radiant heat. Steel structures are less likely to be affected by radiant heat, but flame contact can heat them so that they soften and ultimately fail. Water, applied properly and in sufficient quantity, can absorb this heat and prevent damage. Here again, the water can take the maximum amount of heat only from surfaces that are above its boiling point. A heat transfer rate of 20,000 Btu per hour per square foot is often mentioned as a peak rate for heat transfer to fire-exposed steel, such as the shell of a tank. This is 330 Btu per minute. If the surface was above 212° F, so that all of the water that reached it would boil, this amount of heat could be absorbed, and the steel could be protected from overheating--that is, kept from rising above 212° F--if only about .04 gallon per minute reached the surface. Of course, in any practical case, only part of the water can actually reach a surface to do this maximum amount of cooling, and a rate of about five times as much, or .20 gallon per minute per square foot is frequently recommended, as shown in Table 7.

Selection. With regard to the subject of cooling, it is well to emphasize one other point. Many of the liquid petroleum products that you will encounter have boiling points well below 212° F. Gasoline, kerosene, and stove oils all start to boil below the boiling point of water. If a tank contains such an oil, the part of the shell that is below the liquid level will be kept cool by the liquid inside. Even though this contained liquid is boiling, the steel that it contacts cannot get very hot. Fire fighting water applied to such a surface cannot absorb the maximum amount of heat. Water from the lower oil-wet parts of a tank may run off barely warmed, and thus be largely wasted.

This point should always be remembered: Water does its most effective job of cooling when it is converted into steam. Judgment is required to direct the available water supply in such a way as to make it most effective. Select the areas most severely exposed and avoid wasting water on objects that are so far from the flame as to need no cooling.

As far as tanks and other similar petroleum equipment are concerned, it is a safe rule to say that equipment will not need cooling unless flames actually touch it. Radiant heat will not damage equipment. The parts of the equipment that are invisible because they are enveloped in the flame need the protection; the parts that can be seen are unlikely to be endangered.

Application. Water applied to an oil fire may be used in two principal forms--spray (or fog) and straight stream. Each has its particular advantages, disadvantages, and scope of application. If we consider the type of pattern delivered by the usual fully adjustable nozzle, there are, of course, a variety of intermediate patterns between the wide angle fog and the straight stream, and each of these in turn has advantages and disadvantages. In general, it may be said that the straight stream has the greatest range and driving force, that the wide

16459

angle fog has a short range and affords the maximum protection for the fire fighter, and that some in-between position, which combines the two, will in most cases be the most desirable.

A dense spray of water may stand as a barrier between flame and fire fighters, to protect them against radiant heat, thus permitting closer approach for such important steps as closing a valve to shut off the flow of fuel feeding the fire. This use is too well-known to require discussion.

There is no need in this paper to take a position in the arguments on high pressure versus low pressure or on the merits of various types of nozzles. Although firemen may have opposing opinions as to how this can best be accomplished, the object is to get the water where it will do the most good.

Mechanical Effects of Water

Most of what has been previously said relates to the cooling effect of water. The mechanical effects are almost of equal importance. The place where oil burns may be very important. Oil floats on water, and flooding a fire area may cause burning oil to flow to an area where it could do a great deal more damage. Again, it may be diverted into an area where it could burn without doing any damage at all. This may be accomplished by the combined effects of floating and the force of hose streams.

If a container develops a bottom leak, adding water may float the oil above the level of the leak.[6] This method has been used to stop the flow of oil feeding an otherwise uncontrollable fire, and also to cut off a leak before fire has occurred. Water for this purpose may be added to the top of the container by hose stream or pumped into a line that communicates with the tank.[7]

- One word of caution: Don't overflow the tank! The rate of water addition must match the rate of leakage.

If a stream of oil is issuing from an open-end pipe or valve, fed at a pressure lower than the nozzle pressure, it is possible completely to stop the escape of fuel by playing a hose stream into the opening. This can often successfully be done even though the leak has already taken fire.[8] If a leak in a pipeline has occurred in such a way that a hose stream cannot be played directly

[8] Loc. cit.--Editor.

16460

against the leak to stop it, it is sometimes possible to make an emergency connection somewhere else on the same line. The connection can be used to force water through the line so that water leaks out of the opening instead of oil.[9]

Summary

Water is the best fire-extinguishing medium available in the quantities required for large fires. For oil fires it is valuable in three principal ways:

1. As a cooling agent, water may be used to:

   - Cut off the release of vapor from the surface of a heavy oil, thus extinguishing the fire.
   - Protect fire fighters from flame and radiant heat when closing a valve or doing other work requiring close approach to the fire.
   - Protect flame-exposed surfaces, most effectively when the surface is shown 212° F.

2. As a mechanical tool, a water stream can do work at a distance to:

   - Control leaks.
   - Direct the flow of oil to prevent its ignition or to move the fire to an area where it will do less damage.
   - Dissipate escaping gas into the atmosphere to prevent widespread ignitable vapor clouds.

3. As a displacing medium, because water is heavier than oil, it may be used to:

   - Float oil above a leak in a tank to interrupt a leak, either before or during a fire.
   - Back-pump a line to cut off fuel escape.

Water may be misused because, injudiciously applied, it may push fire to new areas to increase the fire damage, and may overflow containers.

Conclusion

In the space available it is not possible even to mention all of the ways in which water may be used in fighting oil fires. In whatever quantity it is available, water will be employed most usefully when all of its capabilities and limitations are known and when fire fighting strategy is carefully planned with these facts in mind.

16461

6 IGNITION OF HYDROCARBONS BY HOT SURFACES

Oliver W. Johnson
Standard Oil Co. of California

In the oil industry much attention is given to fire prevention. This includes frequent inspections of operating equipment and work procedures and, most important, a careful analysis of past fires. Sometimes the source of ignition is obscure. Simply guessing at the cause is never satisfactory, since the true cause may pass undetected and no lessons can be learned from it.

Oils and gases can ignite from hot surfaces--but not from every hot surface, because the degree of heat, time of exposure, and the nature of the oil are controlling factors. When a fire service inspector checks the cause of the fire, he can do a much better job if he knows these facts.

The control of fire hazards in industrial plants requires a knowledge of the factors influencing the ignition of various materials that accidentally may come in contact with hot surfaces, such as steam pipes or engine exhaust manifolds. The temperature to which a surface must be heated in order to produce ignition can be determined experimentally. It is influenced both by the nature of the combustible material and the manner in which it contacts the surface. It is impossible to establish any general rules that will apply to all conditions.

In general, fixed gases are more difficult to ignite than the vapors produced by charring solid materials or by evaporating and cracking the residues of heavy oils. Also, as a general rule, any circumstance that tends to increase the time of contact of the vapor with the heated surface will promote ignition at lower temperatures. When ignitable vapors remain in long contact with the heated surface, it can be shown experimentally that oxidation may proceed first at a slow rate, yielding heat, which raises the temperature of the mixture; this temperature rise in turn accelerates the reaction, resulting ultimately in flame. This effect cannot occur where the surface is in the open air so that normal convection currents prevent retention of the mixture close to the heated surface. As an extreme example, flame can result from introducing a drop of gasoline into an enclosure, the walls of which are heated to about 500° F; whereas, when a pipe or other similar metallic surface is exposed to the air under ordinary atmospheric conditions, a surface temperature of over 1200° F will be required to produce ignition when a drop of gasoline is splashed or sprayed against it. The lowest temperatures reported in fire prevention literature as "ignition temperatures" for various substances all are determined by the method that is used to introduce the material into a heated enclosure.

16 462

Following in Table 8 are results of tests recently made to determine the temperature to which a surface exposed to free convection on all sides must be heated in order to produce ignition of various substances. The heated body was made of cast iron, about 3 inches by 4 inches in horizontal dimensions and 1 inch thick, and was supported on a vertical rod so as to be completely surrounded by air. It was electrically heated, and the temperature was measured with a thermocouple placed in a hole in the upper surface. As a matter of convenience, the substances to be tested generally were placed on the top surface; a few trials made by bringing materials into contact with the sides did not produce different results.

TABLE 8
Ignition Reactions

Material	Reaction	Degrees F
Sulphur	Ignites	570
Paper	Smokes and chars	630
Paper or sawdust	Shows first spark	880
Paper or sawdust	Ignites and burns	1000
Drops of ethyl ether	Ignite	1100
Lube oil	Ignites when held in contact with hot surface by charred paper	1170
Gasoline	Ignites when held in contact with surface as above	1200
Drops of petroleum ether or lube oil	Ignite when placed on bare metal	1230
Spray of petroleum ether	Fails to ignite when directed at surface	1240
Petroleum ether vapor	Ignites when released close to the surface	1300

The conditions of these tests closely simulate field conditions, wherein drops of petroleum may be sprayed on heated surfaces or where the vapors from petroleum are carried across such surfaces by the wind. The figures given above may be used as a rough guide in evaluating the hazards of ignition from accidental exposure of this kind. The figures obviously do not apply to the case where oil or vapor is held for long periods in contact with the heated surfaces, such as when insulation around a hot oil line is wet with liquid oil.

16463

PART 2 OIL FIRE CONTROL PROBLEMS

53

16464.

7 PRINCIPLES OF OIL FIRE FIGHTING

W. B. Klaus
Tidewater Oil Co.

The first paper in Part II covers general principles. The fire-fighting practices described may be applicable to fires in an oil field, in a refinery, bulk plant, service station, or any oil plant or consumers' property. In a practical way the author describes various methods of fighting oil fires and brings out the necessity for properly assessing the job in order to select the most effective and safest method, depending upon the type of oil involved and the situation at hand. The paper sets the stage for subsequent papers, which deal with specific types of oil properties such as bulk plants, tank trucks, and service stations. (This paper, which was presented at the 1955 and 1961 Bakersfield Oil Fire Control Schools, has been revised for this book.)

Long Beach Fire Department

Fig. 9. Many fire departments use tabletop demonstration apparatus for discussion of the "three essentials."

Oil fires are not conflagration breeders. There are no flying brands to carry over the heads of the fire fighters. Although spectacular clouds of black smoke make oil fires look threatening, those very clouds absorb the heat of burning gases and reduce exposure temperatures. There are fewer exposure hazards. Sometimes it is better to control an oil fire and let it burn until the

16465

fuel supply can be shut off than it is to extinguish it. Because such facts are not generally known outside the industry and oil fires always seem to make good newspaper copy, stories with erroneous terms, such as "explosive gasoline fires," and spectacular photographs of massive columns of smoke have engendered a fear psychology in the public mind.

You know that a fire requires three essentials. First, you must have fuel in vapor form. Second, you must have air mixed with fuel vapor in the right proportion to form a flammable mixture. And third, you must have some source of ignition. These essentials provide three avenues to fire control and extinguishment.

Disregard the kind of fuel involved for the purpose of the following discussion. Assume that a fire is under way and select one or more of the principal methods to extinguish it.

Controlling or Shutting Off the Fuel

Each of you has used gas appliances or gasoline camp stoves. You have extinguished fires in them by closing the fuel supply valve. Similarly, the most common method of extinguishing petroleum fires is to shut off or interrupt the fuel supply by closing a valve.

Sometimes, if there is no valve and if the leaking pipeline is small, you may be able to crimp or flatten the pipe and shut off the fuel. Gas companies have viselike tools for this purpose. If a leak develops in a drum or tank, or if an open pipe is discharging gas or liquid, the flow may be stopped by directing a hose stream into the opening; and if the volume and the pressure of the fire stream is greater then the pressure inside the drum, tank, vessel, or pipeline, the flow of fuel can be stopped. If a pipeline is leaking, fire hoses can be connected to the line and water can be used to displace the fuel in the line. This method has been used successfully on many occasions. Fuel leaking from a valve on the bottom or side of a tank may be stopped by adding water to the tank and floating the fuel above the leak, thereby cutting off the source of the fire. When the fuel is floated like this, care must be taken that the flammable contents of the tank will not overflow. You must know the fuel level of your tank.

So far the topic of discussion mainly has been shutting off the source of liquid fuel or gas fuel from a pipeline, tank, container, or similar equipment. Sometimes the fuel cannot be shut off, but it can be flushed or piped away and burned at a safe location. Burning gasoline from a leaking bottom connection of a tank truck on an open highway could be washed away to burn in a safe place. In a closely built-up area, however, another method may be more practical. Simultaneously with extinguishing operations, firemen must also protect

Fig. 11. A Christmas tree ablaze.

16467

exposures and confine the fire. Water fog or spray absorbs heat very rapidly, covers exposures most efficiently, and confines the fire. Heat-absorbing fog or spray is excellent for protecting personnel and providing a means of approaching a valve for closure. After the source of fuel has been shut off, the water spray must be continued to protect the exposed facilities and to prevent spread while the remaining fuel is consumed.

When large leaks of gas or volatile oil such as gasoline are the source of fuel and when there is a chance of reignition, extinguishment without control of the fuel may be extremely dangerous. The only safe method may be to let the fire burn under control until the source of fuel is exhausted or shut off. Fires in ordinary fuels, such as wood and similar combustibles, generally are extinguished by cooling or quenching the fuel to a point where fuel vapor is no longer formed in sufficient quantities to sustain combustion.

Kern County Fire Department

Fig. 12. A safe approach to the shutoff valve.

16468

The same principle can be applied to kerosene or diesel oil fires. The burning surface may be cooled down with water fog to below the oil's flash point; no more vapor will be released and the fire will go out. This is just another way of shutting off the fuel vapor. Heavier oils, such as fuel oils and asphalts, may be extinguished with water sprayed on the surface of the oil. When the water droplets strike the hot, viscous oil, the steam that is formed produces a froth on the surface. This froth is further cooled until it no longer gives off sufficient vapor to burn, and the fire is extinguished. This method of control is effective on fires involving relatively thin layers of crude oil--that is, up to a few inches in depth--resulting from spills, leaks, or boilovers. If the fire burns long enough to consume the light fractions, the residue is similar to a heavy fuel.

Actually, two kinds of extinguishment are occurring simultaneously when a viscous oil is frothed. As the cool froth shuts off the source of fuel vapor, by holding the oil temperature below its flash point, it also blankets oil surface and shuts off the supply of air from above. This leads us to the second method of extinguishment.

Shutting Off the Air or Smothering the Fire

A fire in an open-top can or tub can be extinguished by placing a tightly fitting metal cover over the can or tub. The fuel vapor-air mixture is controlled by putting a cover on, and the fire is smothered. Using a wet blanket as a cover is utilizing the same principle. It may be impossible to get a cover of sufficient size and proper shape to fit all situations. If a bucket of burning gasoline was leaking onto a table, and the burning gasoline was running onto the floor, a mechanical lid or cover would be impractical; a gas blanket of CO_2 may serve very well.

Blanketing a fire or smothering it with an inert gas has its limitations. Before extinguishment is attempted, sufficient equipment and manpower must be at hand to permit covering the entire area with a concentration adequate to smother the flame. Partial covering is ineffective. Any burning wood or highly heated metal must be cooled before a fire can be extinguished. The same applies to extinguishing with dry chemical powder.

Care must be taken in smothering a fire fed with gas under pressure, such as natural gas, butane, or propane. If there is a relatively small leak, with little likelihood of reignition, extinguishment by smothering may be accomplished safely. But as mentioned previously, a large leak with little chance of being rapidly dissipated by the wind may become dangerous if extinguished without shutoff. The gas, continuing to flow, will form a cloud over an area where men may have moved in, and they may be caught in the flash of reignition.

16469

We have been speaking of covers or blankets for fire extinguishment. One type of blanket, which has proved to be very effective on standing oil pools and tanks, is a blanket of chemical, mechanical, or air foam. The foam blanket, however, must be applied at a sufficient rate and in a proper manner to overcome breakdown by heat or oil submersion. If foam is floated gently onto an oil surface, rates as low as 2/100 to 3/100 gallon per minute per square foot of burning oil surface are adequate. These are water rates supplying the generating equipment, or foam solution rates. Less efficient splash application from a tank top may require rates up to 1/10 gallon per minute per square foot of burning oil surface. Hose stream application on a large fire may not be effective with rates of less than 3/10 to 4/10 gallon per minute per square foot of burning oil surface. For example, a vat of burning gasoline that has 2500 square feet of oil surface may require hose stream equipment capable of delivering water or foam solution at 750 to 1000 gallons per minute for extinguishment.

Fig. 13. Small CO_2 extinguishers are particularly suited to fires on laboratory benches where cleanup and contamination in surrounding areas may be a problem.

Each extinguishing agent has its special field and limitation. Foam, CO_2, dry powder--all have limitations. Water is the most versatile extinguishing agent--and fortunately, the most plentiful--as well as the most readily available and the least expensive.

When using water, you must remember that too rapid application results in an additional problem of waste water, for which drainage is absolutely essential. It is seldom that you can control the use of water to the point where drainage is not necessary. Be practical--drainage must be considered.

Controlling the Source of Ignition

Once a fire has started and the flame from burning shows, the extinguishment of this flame automatically removes this source of ignition. Not all fires are so simple. In other conditions there may be secondary sources of ignition that must be controlled as well. Burning embers, very hot metal surfaces, and sometimes, faulty electrical circuits must be controlled to prevent reignitions. Therefore, in sizing up a fire prior to extinguishment, you may have to plan to quench the embers, cool the hot surface, kill the electric circuit, or take other steps before extinguishing the main fire.

16470

We have covered the three essentials or principles of oil fire control and extinguishment:

- Flame arresting is not a practical approach.
- Smothering with a blanket of inert gas or foam has many limitations.
- Controlling or stopping the flow of fuel, coupled with the intelligent use of water, is the most advantageous approach.

Water is economical and plentiful and has a great heat-absorbing capacity. It is your best weapon for the control and extinguishment of all fires, including oil fires.

16471

8 OIL GATHERING AND PIPELINE OPERATIONS

S. D. Clithero
General Petroleum Corp.

In the application of fire protection principles to specific oil industry operations, it is logical to arrange the subjects in the order of the flow of the oil from its source in the oil field, through the various stages, to the ultimate consumer. These stages were discussed briefly in the Introduction to Part I. An important early stage in this operation is the pumping of the oil at high pressures and rates through hundreds of miles of pipelines to and from the refineries. This paper describes fire protection in pipeline operations, evaluates the potential fire risks, and points out that fighting fires from leaking pump glands in pipelines, and in storage tanks, is no different from fighting fires in other operations. (This paper was presented at the 1955 and 1961 Bakersfield Oil Fire Control Schools.)

This branch of oil industry activity includes dehydration and long-line pumping. Wet crude oils are dehydrated at field gathering stations and then pumped to refining centers. From refineries the refined products are pumped to terminals and distributing centers.

The principal character of each element of this operation follows.

Oil Gathering and Dehydration

Dehydration (removal of water and sediment) is generally done at oil lease gathering tanks. Generally it involves the use of stable, noncombustible chemicals, heat, and sometimes, special electrical processes conducted in low pressure treating shells. In this phase of operation, most difficulties result from lack of proper temperature controls for heating the oil. Overheating occasionally causes treating tanks to boil over and their vapors to spread to ignition sources that normally are safely located. In the electrical method, proper design and measures to control or relieve container pressure have proved effective; fires have been very rare.

Gas engine drives are quite common for pumping from the lease gathering tanks to the main pipeline junctions. Lack of fire incidence strongly discounts concern over this practice.

Pipeline Pump Stations

Pipeline pump stations frequently include substantial tankage. The stations generally are a good many miles apart, necessitating pumping at high pressures.

16472

Steam, electric motors, and reciprocating engines all are common prime movers for the pumps. The distances and pressures, together with a requirement for continuous operation, have resulted in high standards of design and inherently rugged equipment. These features have contributed to an exceptionally good fire record. Proper separation between pumps and their boilers or engines and sensible layout also have proved to be effective safeguards against fire.

The tank fire experience at pipeline stations is similar to other tank experience. The same factors that prevented or caused tank fires elsewhere apply here in about the same degree. One necessary practice, however, is somewhat of a problem, and has caused some fires. Oils pumped into the system come from various and often unrelated sources. The nature of products ranges from butane or unstabilized casinghead to heavy crude. A median blend of pipeline oil is produced by coordinated pumping, which is subject to a variety of circumstances that are difficult to control perfectly. Any one of these circumstances may cause an important change in the character of the oil at any given interval. As a result, slugs of high vapor pressure product getting into the wrong type of tankage or unanticipated deviation in flow rates have caused three or four West Coast fires. However, an elaborate frequent check-call program to the operating or dispatching headquarters (often at one-hour intervals), electronic gauging and recording flow meters, and numerous other special devices are designed to minimize the likelihood of such occurrences and obviously are quite effective in doing so. Considered in relation to the scope of pipelining operations on the West Coast, the lack of difficulty clearly points to a splendid degree of coordination in widespread operations.

Long-Line Piping Systems

The long-line systems unavoidably must be routed through some developed areas. Customarily the line routings are under continuous surveillance by line-walkers, line-riders, airplanes, and remote pressure indicators. The pipeline itself is generally subjected to periodic elevated pressure tests. Internal corrosion is not a special problem; external corrosion is safeguarded against by highest quality of pipe coatings, by cathodic protection, etc. Therefore, most troubles in this part of the operation result, as would be expected, from human failure. Company employees are responsible for only a small proportion of these errors. The majority of accidents result when persons outside the industry carelessly operate heavy duty machinery, which cuts into pipelines. Some serious fires have resulted, because most excavation work is done in built-up areas. Fires caused by "hot work" in connection with repairs of pipeline leaks have been few because the job routine is careful, competent, and planned.

16473

The Fire Record

According to long-term API records, pipeline operations are well within the best half of the industry divisional averages. The records indicate an average experience of one $3000 fire during each 50 years of station operation. This equals approximately $60 loss per year per plant, an overall average loss of about 6¢ each year for every $100 of insurable value.

The West Coast fire record has been substantially better than the national average since the early 1920's, when a series of disastrous reservoir and tank farm fires occurred in wood roof tanks without lightning protection. This type of storage for crude oil was discontinued thereafter, and the subsequent experience has indeed been gratifying in relation to the volume and scope of operation. Some of the details are noteworthy: One company reports 40 years of operating 25 stations without a single station fire. A loss of a total of only $466 is reported for 15 years of entire pipelining operation over Southern California. Another company reports only one tank fire in 45 years of extensive operation.

Several companies equal or surpass one or more of these excellent records. A summary of the composite records of two of the larger companies, which in total fairly well reflects approximately 25 years of the principal West Coast operations, shows that what fires have occurred have been caused:

- 40 percent, human error or faulty judgment
- 15 percent each, lightning and outsiders
- 7 percent, electrical installations
- 38 percent, miscellaneous or undetermined factors

The sources of ignition for these fires were:

- 39 percent, open flames and sparks, including hot work
- 20 percent, lightning
- 4 percent, exposure fires spreading to the company operation
- 9 percent, excavating machinery
- 10 percent, electric sparks
- 18 percent, other or unidentified sources

The Fire Control Pattern

The typical long-term record suggests certain areas in which the fire services could contribute most in preventing losses.

Tankage. Good maintenance is essential; modern all-steel tanks are most unlikely to have fires. So far as pipeline blending and product control is concerned, it appears unlikely the fire service can add very much to what the

16474

companies are already attempting to accomplish internally. The fire service certainly should be informed about a pumping control program, and most assuredly the service is directly concerned with an adequate communication system. The dehydration problem is largely isolated from public interests, but the fire service has a legitimate interest in heat control in individual cases.

Torrance Fire Department

Fig. 14. Prefire planning at a pipeline station. Firemen learn the layout of the plant, its built-in protection facilities, and how to coordinate their work with that of the plant personnel.

Pumping stations. The fire service should participate in prefire planning. Although characteristically good, housekeeping is, of course, of interest.

Layout. Conformity with basic good practice is clearly adequate. Although NFPA 30, Recommended Standard on Storage and Handling of Flammable

16475

Liquids, is an acceptable guide for developed areas, it is entirely too conservative for application to isolated pipeline operations.

Pipelines. Outsiders should never close pipeline block valves on their own initiative. If volatile oil leaks occur, prompt notification of the pumping source, diversion of traffic, and above all, extinguishing of dangerous flames in the vicinity all can be expedited by the fire service. Keep in mind the possibilities of using artificial ventilation by hose streams to disperse vapors from oil leaks.

The fire service can most definitely assist on the problem arising from excavation by outsiders. Franchises require the accurate recording of the identity, routings, and locations of pipelines. In developed areas, excavations should be done only under a permit system. The authorities thoroughly should review every permit, and where there is any need indicated, they should advise the pipeline operator of the contemplated excavation, so that both the operator and the authority can inspect the site and, if need be, stand by.

16476

Cond. = Condenser which stores electricity. In electronics work, the term condenser has been replaced by capacitor.

Point Assembly = Breaker points which make and break current flow in low tension primary circuit.

Dist. Cap = Distributor cap directs high tension current from secondary windings of H.T. coil to spark plugs in firing order of engine.

WS. 13. Geiger Counter: Complete the drawing by inserting the proper symbols found on page 29.

B = Battery which supplies current for system.

R_1 = Resistor for slowing current flow.

V_1 = Counter tube filled with a gas which will conduct electricity when rays of a radio-active substance pass through it.

P_1 = Earphones for hearing clicks of battery current when gas conducts it between electrodes of V_1.

S_1 = SPST, switch turns counter on and off.

Gnd = Electrical ground.

WS. 14. Transistor Receiver: Complete the drawing by inserting the proper symbols found on page 29.

Ant. = Antenna

C_1, C_3, C_4 = Paper or mica condensers

C_2 = Variable condenser

9 BULK PLANTS AND TERMINALS

S. D. Clithero, General Petroleum Corp. and
Frank Bartholomew, Socony Mobil Oil Co., Inc.

Bulk plant fires are rare, considering the number of bulk plants in the nation. The average fireman has had little experience in fighting them. As a result, some fires have been poorly handled, and some firemen have been killed. The bulk plant fire at Kansas City on August 18, 1959, is a well-known example.

Experience has shown that no plant can be made 100 percent safe, especially where bulk products are flammable and where the public is invited. Even with the most conscientious dealer and the safest plant, a careless employee or careless customer can set the stage for an emergency. Firemen should have the knowledge and skill to control it properly.

Firemen should know all the plants in their area. They should hold prefire training sessions at each plant, know where the most likely fire problems are at each plant, and plan the best procedure to use for each type of emergency that could arise. Techniques that are applicable to the average industrial plant may not apply to a bulk plant fire.

In the following paper, which was presented at the 1961 Bakersfield Oil Fire Control School by Mr. Bartholomew, Messrs. Clithero and Bartholomew evaluate the hazards and recommend fire control procedures.

To meet the demand for a variety of petroleum products, bulk distributing plants are located in a good many communities. Many of these plants are locally owned or operated. The business they do and the salaries and taxes they pay help the economy of a community. The products distributed are essential to nearly every activity. At the moment, however, our interest is concerned with the emergency rather than economic aspects.

A properly constructed and operated bulk plant or terminal is not a menace to its neighbors or the community. But some fires do occur, and most of these are the same kind of fires that occur in other commercial and industrial activities. In other cases, the petroleum products or special facilities become involved or exposed. When this happens, you need to be able to anticipate the behavior of the involvement in order to work safely and efficiently.

The National Fire Protection Association's suggested ordinance on the storage, handling, and use of flammable liquids (NFPA 30) defines a bulk plant as, "That portion of a property where flammable liquids are received by tank vessel, pipelines, tank car, or tank vehicle, and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipeline, tank car,

16477

tank vehicle, or container." Such a plant usually consists of tanks of from 500- to 5000-barrel capacity with the piping, pumps, and accessories needed to receive and pump the oils. It includes a loading rack where the local delivery trucks are filled. Generally, there is a warehouse for barrel and package goods. In the small plants, this structure often includes an office and garage space for the trucks. At more extensive operations, there may be facilities for reconditioning and filling barrels and for mechanical and automotive maintenance, along with larger tanks and perhaps a pier or wharf for ships and barges.

Before these products, facilities, and operations are examined in detail, their over-all fire record should be considered. An American Petroleum Institute summary covering over 300,000 plant years of operation indicates a fire frequency of about 165.5 plant years with an average loss per fire of about $1720. The average loss of $10.40 per plant per year is probably considerably below the average annual fire insurance premium on your home.

Three of the larger companies operating in the West found that 39 percent of their fires were related to the usual gasoline transfer operations and that another 12 percent resulted from the maintenance and repairs to gasoline-handling facilities or from the use of volatile products for cleaning.

The Products

A preliminary to considering factors that are most likely to give trouble is a review of the fire hazard characteristics of the products. These can be grouped in two general classifications based on the temperatures at which the oils are normally encountered. The first group includes gasoline, and sometimes liquefied petroleum gases. These are called "low flash, volatile products." The second group includes the solvents, kerosenes, and burner and diesel oils. These are called "high flash, nonvolatile products." This group also includes lubricants and greases that have such low volatility that they are not considered flammable liquids in the National Fire Protection Association classifications. To define the first group as "hazardous" and the second group as "nonhazardous" is not altogether correct. Certain features of the low flash volatile oils actually contribute to the safety of their storage in closed containers. Therefore, the characteristics must be analyzed more closely in order properly to evaluate the conditions under which the various oils may be of concern.

Fire requires a proper mixture of air and vapor. Too much or too little oil vapor in the mixture makes it not flammable. Between the upper and lower flammable limits is the ignitable range. For most bulk plant products, the ignitable range is within 1 percent to 7 percent oil vapors in air. It is necessary to be concerned, therefore, with the conditions under which oils may give

16478

off vapors to produce or exceed this flammable range. All oils have a tendency to evaporate, and they evaporate more rapidly at increased temperatures. Oils that evaporate more rapidly and at lower temperatures are referred to as more "volatile" than other oils that vaporize more slowly. Gasoline is volatile; it produces enough vapor to reach the lower flammable limit at temperatures much lower than does diesel oil. The flash points are roughly minus 50° F for gasoline and plus 150° F for diesel oil.

Oil vapors have a tendency to diffuse into the surrounding atmosphere. When vapors are free to diffuse into the atmosphere without restriction, the area of ignitability extends farthest from the volatile oil. When dispersion is restricted, as by the shell and roof of a gas-tight tank, the volatile oil (gasoline) can make the mixture so rich that combustion within the tank vapor space is impossible. Then, if such a tank is properly vented to limit the pressure the oil vaporization can exert, explosion is impossible. At normal room or atmospheric temperature, the less volatile oils do not form ignitable mixtures within tanks or even at the oil surface. In the open, only gasoline and LP gas produce ignitable vapors over large areas and a breeze disperses them. JP-4 may be stored at large terminals but not at bulk plants (see p. 97).

Vapors from bulk plant products are heavier than air. They may tend to seek and remain in low spots. Vents, therefore, preferably should discharge upward and at some reasonable elevation above grade.

The Facilities

When petroleum handling is involved, most fires occur at the tanks, pumps, and loading racks, the latter having the greatest number of fires. Although some of the most dangerous fires originate around tanks, the factors responsible are clearly recognizable deficiencies in design.

Bulk plant and terminal fires almost never start with the explosion of gasoline tanks. Troubles in tank areas most frequently originate as spills and ground fires. When tanks are inadequately vented to withstand direct fire envelopment, they may burst. Vertical tanks, which are most common in California, behave differently from horizontal tanks when exposed to surrounding fires. (This subject is discussed in some detail later in this paper.) Some poorly vented horizontal tanks have rocketed dangerously. If elevated tanks drop, due to failure of supports to resist fire exposure, contents are likely to be spilled. Actually, there is little excuse for any of these occurrences. Experience points up the following procedures.

Avoiding spills. Most oil spills result from operational failure. The source (pumps, truck, tank car, ship, or barge) from which oil is being discharged into tanks often is remote or out of sight. Good operation includes: (1) Before

16479

starting oil transfers, gauge the tank, check the valve and piping lineup, then recheck the delivery orders and communications. (2) After starting the transfer, check to be certain that piping is tight and that the stream is going into the proper tank at the anticipated rate. (3) At reasonable intervals, recheck the tank gauge to verify the receiving rate. This procedure eliminates most spills or reduces the quantity of a spill.

If the initial spill is high flash oil, fire seldom results. If the spill is volatile low flash oil, few ignitions occur at sources more than 50 feet from oil accumulations, even with such products as gasoline.

Specifying piping and tanks. Piping subjected to ground fire is more vulnerable to damage than tanks are. Cast iron fittings are subject to earlier failure from thermal shock and expansion strains than steel fittings; flanges and threaded joints are relatively more vulnerable than cast iron valve bodies. Total failure of cast iron fitting details is common in from 15 to 30 minutes unless there is cooling by water streams or product flow. Prolonged severe fire exposure seriously damages steel pipe and fittings; however, leakage rather than total failure is the rule. A little cooling water can do a great deal of good. The main valve against the tank is, of course, of prime importance.

Most tanks installed in recent years conform with API Standards 12-A or 12-C, the specifications for riveted and welded tanks, respectively. NFPA has specifications for shop-fabricated small tanks. Many older tanks, while deviating in minor details from the high API standards, are entirely adequate. The criteria are the type of attachment of roof to the shell and the adequacy of vents. It is the intent of both NFPA 30 and API specifications to guard against failure of the tank shell or bottom. It is contemplated that, at worst, the roof of a tank will blow off, leaving the shell and bottom intact to contain oil. It will do this because the shell is not vulnerable so long as it is moistened by the contents. Dry portions of the shell (above liquid level) may distort or crumple; the steel below the liquid level, however, will be kept cool by the oil inside and retain its full strength.

Venting tanks. To preserve product quality and reduce vapor losses, most companies use gas-tight bulk plant tanks for low flash volatile oils like gasoline. Gasoline gives off rich vapors. These are valuable components. Gauge openings on gasoline tanks, therefore, are equipped with tight covers. Vents, to accommodate oil movements and normal breathing with temperature changes, have small pallet valves, which are designed to hold a slight pressure on the tanks most of the time. The inbreathing valve in the pallet opens under slight vacuum as the temperature drops at the end of the day or at night or during rain; it also may open to admit air when the product is pumped out. The outbreathing valve in the pallet opens while the tank is being filled or when heated by sunlight. The capacity requirements of these vents, not only for normal

16480

breathing but also for fire exposure, have been carefully developed by test and experience. The specifications are set forth in API Bulletin No. RP 2000, entitled "Guide to Tank Venting," and have been adopted by NFPA 30.

As brought out clearly by NFPA 30, all tanks also need provisions for emergency venting in the case of an exposed fire. The NFPA film Fighting Tank Fires describes the difference between the venting needs of vertical and horizontal tanks. In brief, it states that:

- In vertical welded tanks designed according to NFPA 30 and API Standard 12-C, the special roof-to-shell seam attachment is designed as a weak seam that will open under overpressure and release vapor from the vapor space. It is designed to be weaker than the bottom-to-shell seam or the seams in the shell itself.

- Some other means of emergency venting must be provided for all other vertical tanks that are not fitted with this special roof-to-shell weak seam. Various means are used, including: (1) large-size conventional relief valves of adequate capacity, or (2) a hinged manhole cover plate, which opens under low pressure or, (3) conventional flat manhole cover plate, which is loosely aligned on the manhole flange with long flange bolts that permit the plate to lift under low pressure.

Fig. 15. The location of the special roof-to-shell "weak seam" attachment, which is typical of vertical tanks found in bulk plants and oil storage tanks. This figure is not drawn to scale.

16481

Fig. 16. Typical pressure-vacuum pallet type of operating vent for a storage tank. Coarse screens in the opening exclude foreign material.

- Horizontal tanks must be fitted with emergency venting such as described in the preceding item.

High flash, nonvolatile oils give off so little vapor that gas-tight tanks are unnecessary. However, openings through which the tank must vent should conform with NFPA venting standards.

Oil tanks exposed to fire of adjacent structures have not proved vulnerable so long as they are properly vented; neither is the propagation of fire from tank to tank likely in the light of modern practices. Extensive experience shows that spacing between tanks, or from tanks to adjacent property lines, is clearly of less importance than considerations of venting, good piping layout, and grading and drainage of tank areas to minimize any problems resulting from spills.

If heated by surrounding fire for some time, tanks storing oil at temperatures below the flash point may become dangerous. Tanks containing volatile oils will remain rich.

Cooling the tank shell by water streams prevents the high flash oils' forming dangerous mixtures but does not cool gasoline tanks enough to make them explosive. Some companies base their design for water fire systems on 0.1 gallons per minute per square foot of tank shell and roof area that may require protection. This rate, applied to the tank steel, has proved adequate to prevent serious developments.

16482

Installing dikes. NFPA 30 suggests installation of walls or dikes around tanks "where deemed necessary by the Fire Chief," because of the nature of the topography and proximity of waterways or places of public assemblage; furthermore, subsections specifically give the fire chief discretionary power to alter the proposed standards. This discretion is highly advisable, since a good many experiences in which impounded oil has been held close around tanks have shown that walls may interfere with fire fighting and contribute to the severity of the loss. The contrary also has been true in some instances. There are times where there would be no alternative to impounding in the immediate tank area. Each case should be carefully considered with the following facts in mind:

- The present design trend, because it is best, is to grade areas of possible spills away from piping and tanks. It is preferable to divert oil to areas where its burning would be least damaging and where there is a minimum of interference to the controlling of possible continuing oil flow. Even where surroundings dictate the building of impounding walls or curbs around the tanks, the cell area should be graded away from the most vulnerable facilities. The impounding areas should have drains of adequate capacity.

- Fire walls of any capacity are unlikely to be of much benefit if horizontal tanks rocket. High fire walls retard vapor dispersion and interfere with safe access and fire fighting effectiveness.

- Under NFPA 30, basic impounding capacity is the drain-out capacity of the largest tank within a common enclosure. This capacity stipulation can be modified at the discretion of the chief, for tanks seldom fail.

From an analysis of a great many fires, the writer is convinced that good grading, low curbs, and remote impounding capacity of small volume with proper drainage provide a better opportunity for controlling emergencies than the high diking practices of the past.

Fighting fires at loading racks. Tank trucks and tank cars receive their products at loading racks where the pipe risers terminate in swing joints that permit the fill stems to be inserted into the open domes of the compartments or tank. While closed transfer systems are used for LP gas, filling through open domes is common for both low and high flash oils. Under typical outdoor conditions, it has been found the vapor hazard is zero 4 or 5 feet away from the open domes of the gasoline trucks being filled. Longer extensions for fill stems are often used for gasoline loading. By extending nearly to the bottom of the tank, these permit high filling rates with less splashing and vapor loss. Filling rates vary widely; from 100 to 600 gallons per minute is a common range. These rates require the strict attention of the loader. For

16483

the sake of close control, many fill stems have self-closing lever valves of the "dead man" type. Some newer racks handling large volumes utilize preset meters for automatic filling controls.

Fires at loading racks usually are of two kinds--the simple dome fire and a fire involving running the tanks over. Simple dome fires are almost always caused by lax static bonding procedure, not by vapors drifting away from the truck and igniting at some distance from the dome. As a part of their regular fire prevention studies, oil industry fire protection engineers have made extensive studies of vapor drift at loading racks. They have found that vapor being released from the open dome vertically into the air, some distance above ground level, quickly dissipates into the air, even with no wind. This also is proved by years of experience at busy loading racks with complete freedom from ignition by nearby traffic.

In avoiding dome fires the main attention is directed toward preventing smoking by the loader on the truck and to insuring proper static bonding procedure. The latter necessitates attaching the bond wire from the loading rack to the tanks before opening the dome cover and not disconnecting the wire until after the loading is completed and all dome covers are latched in place. In many locations loaders are required to use this procedure regardless of the flash point of the oil being loaded or by wet or dry weather conditions. Its proponents consider this should be a standard procedure, regardless of whether there is a potential static hazard or not.

The flow of gasoline or other dry oil into the truck tank generates a static charge on the vehicle. If the vehicle is bonded to the fill pipe or rack structure ("ground"), this charge bleeds off as fast as generated. If the tires and pavement are damp, the charge bleeds off as fast as generated, even though the bond wire is not used. If the condition is dry and the bond wire is not used, the charge builds up on the vehicle; and then, if the fill stem touches the neck of the dome opening while loading is underway, the charge may spark over the gap between the fill pipe and the neck of the dome. If the surrounding vapor-air mixture is flammable, this spark may ignite the vapor. If a high flash oil is being loaded, no vapor will be present to ignite.

A simple dome fire is easy to handle. When the loader releases the handle of the self-closing "dead man" valve, the flow of oil stops; the rate of vapor release is reduced, and the small, lazy fire may be readily extinguished with a dry chemical or CO_2 extinguisher or by smothering with a blanket or large heavy cloth. Some dome fires have started by a "single action" or unhooded cigarette lighter's dropping out of the shirt pocket of the loader and landing upside down on the truck near the dome opening. The Safety Order No. 6772 prohibits the carrying of this type of lighter at operations where there is a potential ignition hazard. Some dome fires have been caused by the bond wire

16484

clip's being disconnected near the dome opening while loading into this dome was in progress.

The greatest single hazard at a gasoline loading rack is a bad spill. Serious spills never should occur when self-closing "dead man" valves or preset meter controls are used at the fill pipes. Of course, loaders should check to see that bottom valves on the tank truck are closed before starting to load. Steps in handling a spill fire should include:

- Shut off the source of fuel to the rack, using a remote control valve in the pipeline leading to the rack. (Do this before the firemen arrive.)
- Flush the burning spill out from under the truck so that it will burn off at a safe location. (Don't use so much water that the burning oil may flow to and involve other equipment or property.)

Fig. 17. Refinery fire fighters tackling a full-scale tank truck training prop.

16485

- Extinguish the ground and tire fires first, then the dome fire. (Don't get water into the truck and cause more spill.)

Operating pumps and piping. Most troubles originating around the pumps are due to poor housekeeping, leaky packing, and poor maintenance. The modern trend is toward outdoor pumps, to get the maximum benefit of natural ventilation, and toward the use of mechanical seals instead of packing. Ventilation for gasoline pumphouses should be at floor level.

Normally, pumps operate at moderate pressures (about 50 psi), and their characteristics are not such as to make the prime movers of extraordinary concern. Although most companies use nonsparking induction electric motors, these often are not totally enclosed. It is of interest to recall that companies used gas engine drives on bulk plant pumps for many years without a particularly bad record. It is general practice, however, to avoid installing sparking electrical equipment inside pump houses or closer than 15 to 50 feet away outside, depending upon the type of pumping installation. Hot bearings or packing, improper electrical installation, and careless use of open flames have ignited most fires. Severe developments have resulted from failure to close tank valves after cast iron fittings failed through lack of thermal relief or prompt cooling by small water streams.

Warehousing. Most warehouse structures are of light, commercial-type construction, often of corrugated iron on wood or steel frames; floors generally are elevated to truck bed height and designed for heavy loading to accommodate storage of barreled products. Floors and substructures of wood are common. Some companies provide outside storage areas for drums of low flash volatile oils, restricting the warehouse to the storage of high flash, nonvolatile products except for insignificant quantities of specialties. With proper provisions, however, including solid substructure for the floor and adequate ventilation, gasoline drum storage--and even gasoline drum filling--has been handled safely inside warehouses. In many of the one-man plants, truck fill stems are at the warehouse loading dock. Although this is not a recommended arrangement, it has been safely accommodated by attention to valving, grading, and fire stop construction for the face of the dock.

Supplying proper fire fighting equipment. Generally, both local delivery and transport trucks carry an extinguisher. An extinguisher generally is located centrally with respect to pumps, piping manifolding, and the loading rack; also at the warehouse. Currently, the dry chemical or the CO_2 extinguishers are favored. Domestic water services generally are used to supply one or two small first aid water hoses. Garden hose, of 1-1/2 inches at most, has proved highly useful; large hose is impractical because of lack of manpower. The fire record fails to justify foam protection at bulk plants. The most important need is for plant operators to understand how much good can be accomplished with first aid fire fighting equipment and to learn how to use it.

Collaboration Between Fire Service and Bulk Plant Operators

In view of the foregoing discussion, just what can be done jointly by the fire service and plant operators to their greatest mutual advantage? The answers appear to be simple:

- Learn what factors are of justified concern, and concentrate on those in an effort to prevent fires.

- Visit plants and preplan for emergencies.

  1. Discuss procedures and question those you feel may be improved.

  2. Encourage procedures that minimize the number of handlings required to get gasoline to consumers.

  3. Help educate operators in the proper use of bonding facilities and encourage consistent, correct use of bond wires.

  4. Become familiar with how details suggested by the foregoing procedures apply to the individual plant so that, should trouble occur, a predetermined plan of operations can be carried out by plant personnel preceding your arrival. It is most helpful to educate, or preferably to train, local operators in what can be accomplished with first aid protection, especially with a small water hose.

  5. Critically enforce good housekeeping.

It is somewhat doubtful that many changes in layout and equipment will be justified at existing plants. However, the fire service rightfully should insist that tanks be properly vented and should encourage development of grading that minimizes the problem of possible oil spills.

Remember that your visit to the plant will be most welcome and helpful. Continual vigilance is necessary to the safe handling of petroleum products, and your occasional visit will stimulate close attention, which in the long run will benefit industry and reduce the likelihood of your having to fight fire.

Editor's note. To the preceding paper on bulk plants, suggestions may be added concerning fire control of drum or barrel storage.

Full drums usually are stored on end with the bungs up, so that the bungs do not leak in storage. Experience has shown that when a closed upright drum is exposed to fire, it usually blows out the bung or the top head without releasing its contents. This happens because the steel below the liquid level in the drum does not heat above the liquid temperature. If exposed to flames, the top seam and head above the liquid level heat much more and can weaken the metal, seam,

16487

or bung opening. When the upright drums contain heavy nonvolatile oil, the heads usually bulge upward and crack at the seams. Drums that contain a more volatile product may blow out their top heads violently, but they almost always remain standing upright in place and do not spill their contents.

From a fire protection standpoint, drums should be stored on end but sometimes operating difficulties require them to be stored on their sides.

Where possible, full drums should be stored only one deep, with aisles between to permit proper cooling with long-range straight streams. Good drainage is desirable, so that burning fuel is flushed away from the storage area and the flames do not contact other drums. As demonstrated in Drill 9, page 187, not much water is needed if it is applied properly; and this is a decided advantage, particularly when drainage is not the best. With horizontal storage, the firemen should work from the side and not expose themselves to the possible danger of a drum head's blowing out.

Sometimes the question arises as to whether or not a gasoline spill should be kept out of the sewers. Most firemen who have experienced the problem agree that it is almost always desirable to wash the gasoline underground into the sewer as quickly as possible, particularly when there is no strong wind to rapidly dissipate the vapor from a spill. The light ends normally evaporate in the sewer and dissipate en route to the sewer outlet. However, the authorities in charge should be notified promptly so that they can take proper precautions. When burning gasoline is flushed into a sewer where there is a deficiency of air, the underground fire quickly smothers itself. Experience has shown that danger of an explosion in a sewer is remote.

In this paper there are no illustrations of drill ground props that can be applied to the kinds of fires that can occur at a bulk plant. Such pictures would duplicate those in Part 3. See, for example, loading rack fires: Figs. 53, 69, 71, and 72; pump and bleed fires: Figs. 36, 45, Figs. 67 and 78.

Often bulk plant deliveries are made to customers' properties. These facilities may be similar to a bulk plant, with oil storage, pumps, pipelines, and a wide variety of warehousing and operating equipment. Often the equipment is congested and the housekeeping may be substandard in comparison with the average bulk plant. Some unique fire fighting problems may be evident in prefire training sessions. Also, the employees may not be adequately trained to handle even minor fires.

It is particularly important that:

- The fire prevention bureau inspectors check customer facilities periodically and have deficiencies corrected.
- The suppression officers familiarize themselves with the facilities' fire problems and do an adequate job of prefire planning. (See Fig. 14.)
- The training officers encourage the local plant management to permit them to assist with in-plant fire training and the coordination of plant supervision with the fire department.

16488

10 CONTROLLING FIRES IN GASOLINE TANK TRUCKS

Donald M. Johnson
Standard Oil Co. of California

Tank trucks may be used to transport crude oil from oil fields in lieu of pipelines. However, the most common use is the delivery of gasoline as covered in the following paper. Since tank truck construction and operations are so well known, the author devotes his discussion to fire control technique.

At many of the fire schools described in Part III, much training was devoted to fires involving tank trucks. This included closing off valves at the fill stem when loading and closing the bottom valve when unloading. Other training covered closing valves or gaining other kinds of controls under a wide variety of conditions such as spills, gutter fires, etc. (This paper was presented at the 1961 Bakersfield Oil Fire Control School.)

Gasoline is a volatile flammable liquid, which vaporizes readily at most atmospheric temperatures. Inside a container, such as the cargo tank on a tank truck, the vapor space normally is too rich in vapor to burn if the liquid has been in the tank for long. Fires of the cargo tank of any tank truck are almost always a result of gasoline's being released, in either liquid or vapor form. Vapor will not travel far from its source, but liquid may flow some distance, depending upon volume and terrain. These characteristics often can be used to advantage in controlling a fire involving spilled gasoline.

The tactics employed in each situation will depend upon existing conditions. As in any fire, it is important that these conditions be quickly and accurately determined as a part of the size-up. Some of the questions that must be answered before an effective plan of attack can be selected are:

- Are there any rescue operations needed, and what actions are required to make the rescue?

- What are the exposures? Can they be protected by water cooling? Or can straight streams be used effectively to flush fuel away from exposures into less vulnerable areas? Will application of water tend to spread spilled fuel in an undesirable direction?

- What steps are necessary to gain confinement of the fire? What is the source of fuel? Is it vapor coming from liquid inside the tank? Is it spilled liquid outside the tank, and if so, is liquid continuing to be spilled and from what source? How can the flow of fuel be stopped? Are there

16489

any valves or other controls that will stop the flow of fuel, and if so, how can they be reached? Will cooling the tank with water reduce the rate of fuel release, or is water likely to spread the fire into a larger area or toward important exposures?

- After the fire has been contained, how can extinguishment be achieved? Can the fire be extinguished with a smothering agent? Or will the spilled fuel have to burn out under control?

- After all of the flame has been extinguished, what overhaul steps are necessary? Is there fuel remaining, and if so, what precautions are necessary to avoid reignition? How can the remaining fuel be disposed of or removed from the area in a safe manner?

Suggested plans of attack, based on several different situations, are discussed in the following paragraphs, using the basic divisions of fire fighting tactics--that is, rescue, exposures, confinement, extinguishment, and overhaul. Note that all of the tactics suggested in the examples below involve only equipment and materials normally available and familiar to all fire fighting organizations. In tank truck fire control, as in most other types, the small water hose with a limited volume of water is the basic fire fighting tool.

Fire at the Dome of a Tank Truck at a Loading Rack

Rescue. Seldom involved, except for possibility of the loader's being injured in initial flash.

Exposures. Normally, exposures are limited to fill piping and valve. No protection normally is needed unless there is considerable delay in closing the valves in supply piping. If water is used, avoid getting enough into the truck tank to overflow gasoline out the open dome.

Confinement. See that the valves in loading rack risers are closed and supply pumps are turned off. If these controls at the loading rack cannot be reached, see that the valves at the tanks are closed and the main switch or individual switches at pumps are turned off. Do not attempt to remove the fill stem from the dome opening, for there is too much chance of liquid's spilling or splashing onto personnel. Under most conditions, attempting to move the truck before the fire is extinguished is more likely to spread the fire than to make it easier to control.

Extinguishment. If dome is unobstructed, close cover or smother flames with dry chemical, CO_2, blanket, coat, or similar item. Use the same tactics if the dome is obstructed with the fill pipe, except that the cover cannot be closed. In some cases the flames can be "blown out" with a straight stream of water

16490

directed across the opening, but care must be taken to avoid overflowing the tank or splashing gasoline out, onto the truck.

Overhaul. After the fire is out, the fill pipe, if any, can be removed and the cover replaced.

Spill on Ground under Truck

Rescue. Seldom involved.

Exposures. Normally the truck is the only exposure. If conditions permit, flush out spilled fuel from under the truck and away from other exposures, into open area or into closed drains. Apply small amount of water to portions of the cargo tank in contact with flame to keep the contents from expanding or boiling to overflow the tank. Be careful to avoid getting enough water in the tank to cause overflow. If tires are involved, a small amount of water will cool the burning rubber.

Confinement. If the truck is equipped with internal valves, make certain that they are all closed. Most trucks have at least one internal valve control remote from the meter compartment. These points are designated by a sign marked "Emergency Valve Control." Burning vapor at the vent in the dome cover is not likely to do any harm, and the flame will go out by itself when pressure in the tank is reduced.

Extinguishment. After the flow of fuel has been stopped, attack the fire on the ground. In most cases, the spilled fuel will have to be allowed to burn while the truck is protected, as discussed under "Exposures," above. If spill is small or nearly consumed, dry chemical may be used effectively, but be cautious to avoid injury in the event of reflash of remaining fuel in case some undetected ignition source is present. Any remaining fire at the dome of the truck can be extinguished by one of the methods described in the previous example.

Overhaul. Sources of ignition should be carefully guarded against in the vicinity of any remaining gasoline until it is dissipated through evaporation, covered with sand or dirt, or otherwise removed. Automotive or other internal combustion engines must always be considered sources of ignition. Close and latch all dome covers, or otherwise tightly cover all dome openings before attempting to move the truck.

Large Spill around Truck without Fire

Rescue. In a serious accident the driver of the truck and other persons may be trapped. Where gasoline has been spilled but not ignited, all possible precautions must be taken to avoid ignition. Rescue or other vehicles must

16491

237 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963-A

not be operated within the vapor area. Use of hose streams to flush gasoline away from trapped persons, or a water spray stream as protection for rescuers and victims, in case spill should ignite accidentally, usually is desirable.

Exposures. Using water streams, dirt, sand, or other available materials, attempt to divert spilled gasoline from potential exposures. When using water, take care not to spread the spilled fuel toward potential exposures or ignition sources.

Confinement. Limit spread of spilled fuel, as already discussed. It is usually safer to flush it into a closed drainage system, if available, than to leave the fuel out in the open. If possible, stop the flow of fuel from the truck tank. If the leak is relatively small, a soft wooden plug may be effectively used in stopping the leak; or if the leak is near the bottom of the tank, the leaking gasoline sometimes can be displaced by putting water in the top until the water is being released at the leak. Keep water entering at about the rate of leakage until the leak can be stopped by other means, being careful not to overflow the tank. Clearing the area of all nonessential personnel and patrolling the area is important, but open flame road flares should not be used as warning devices within the area of possible liquid or vapor travel.

Extinguishment. Not applicable in this case, because there is no fire.

Overhaul. Most of the hazards mentioned above under "Exposures" and "Confinement" will remain until the spilled gasoline has been removed by evaporation, covering it with dirt or other material, pumping it to another truck, or another method. Take care, when righting or moving the damaged truck, to avoid spilling more fuel.

Large Spill and Fire around Truck

Rescue. In an accident of this type, rescue efforts must be made promptly, usually with straight water streams for flushing and spray streams for personnel protection, as discussed in the previous example.

Exposures. In general, exposures do not require cooling unless flame is actually contacting them or paint is being blistered. In most cases, spilling gasoline burns about as fast as it is released and so does not flow far from the tank. Fires of this type do not release burning brands or other flying objects, which may ignite material some distance from the fire scene. Where nearby structures or materials are being seriously exposed, keep them wet with water, keeping in mind that water that runs off is excess.

Containment. Attempts should be made to contain the spilled fuel by the methods discussed in the preceding example. Tank trucks normally are vented to protect

237 16492

them from excessive internal pressure, so fire fighters can approach them safely. Tires may burst from excessive internal pressure due to the heat, along with weakening of the tire through burning. Tire bursts should not be mistaken for cargo tank "explosions."

Extinguishment. In most fires of this kind the spilled fuel must be permitted to burn out. This is not only the safest for fire fighting personnel, but it also simplifies the problems associated with overhaul. In some cases the last small flames, such as those at dome openings, can be extinguished with portable dry chemical or carbon dioxide extinguishers. Make certain all hot metal and glowing materials have been cooled before extinguishment with the smothering type of extinguishers is attempted.

Overhaul. Any gasoline remaining in the truck tank after the fire is out is likely to be hot, giving off vapor at an unusually high rate. Guarding against reignition is very important. Otherwise, overhaul procedures should follow the same pattern as discussed in preceding examples.

16493

11 SERVICE STATION FIRES

S. D. Atherton
Tidewater Oil Co.

This paper on service station fires presents two hypothetical cases--a fire at a pump island and a fire in the lube room. Some fires occur when a tank truck overfills an underground tank, but this type of fire already has been discussed in the paper dealing with tank trucks. (At the 1961 Bakersfield Oil Fire Control School, Mr. R. A. Walker of the Tidewater Oil Company spoke on this subject. The manual contained an outline of his talk, on which this article is based.)

Should a fire occur at a service station, there are, as with other types of fires, certain tactics that must be considered. As you know, the size-up and strategy used will have a tremendous bearing on the outcome. Your best means of being prepared for any such fire is through prefire planning and fire drills. In the first sizing-up of any fire, it is assumed that the ranking officer will consider such factors as wind direction, weather, drainage, closeness of other exposures, accessibility of water supply, and promptness of response of help.

A Spill Fire at the Pump Island

One example of a fire at a service station is a spill fire following a failure of the dispenser hose. Assume that the flow of gasoline is approximately 12 gallons per minute and has spread around the customer's car and the pump island. First you should size up the situation and determine what work will have to be started immediately.

Rescue. Should there be occupants in the car, use straight streams of water to flush the burning gasoline from under and away from the car. Also, water fog can be used on a close approach to protect the occupants and fire personnel until the rescue is completed. The same tactic may be used when checking the service station office and lube room areas for personnel who may have been injured or trapped therein.

Exposures. Generally, the fire exposure is limited to the immediate area. However, collapse of the overhead canopy, other cars in the fueling area, drainage, adjoining buildings, and wind direction may need to be considered in the comprehensive size-up. Using water wisely will help to control the fire. Enough should be used to effect cooling without flooding and spreading the fire unnecessarily.

16494

Confinement. Through preplanning, the officer in charge should know where the electric switch panel is located, and he should promptly shut down the pump, if the attendant has not done so already. The attendant may have been injured and may not have shut down the pump. If the officer does not locate the switch panel, the approach to the pump switch should be possible under water fog protection. Drainage and sewers and the direction of attack must be considered to minimize the chance of additional exposure problems.

Extinguishment. Of course, water should be used for flushing the burning spill into the open or into a nearby sewer inlet while the pump is being shut off and afterwards. If sufficient dry chemical powder is available, however, it can be used in conjunction with water fog cooling streams for complete extinguishment. If gasoline has been washed into the sewer, the appropriate authorities should be notified promptly.

Overhaul. If the fire is extinguished before all the fuel is burned, there will be the risk of reignition of the vapor from glowing embers, from burning tires, electrical sparks in the automobile at the island, etc. Hence, it may be advisable in some circumstances to flush the residual fuel into the open, away from the potential source of ignition, and let it burn out safely under control of fog nozzles. In other cases the fire may be extinguished, flushed into the sewer, absorbed in dirt, and disposed of. The area should be thoroughly hosed down to quench all embers, and electrical ignition sources should be checked out.

Fire in an Elevated Car

Another example of a service station fire is a vehicle on a lube room hoist that develops a gas tank leak and ignites from an unknown source. The maximum amount of fuel from the vehicle would be 20 gallons.

Rescue. The probability of a rescue in this situation is not likely. However, should there be occupants in the vehicle, the hoist should be lowered immediately while water fog protection is provided for the occupants and for cooling the vehicle gas tank.

Exposures. These are the close-by service station equipment and the supplies generally found in the lube room and in the vehicle itself.

Confinement. Keeping in mind that the vehicle fuel supply will be 20 gallons or less, the firemen should attempt to flush burning gasoline out of the lube room entrance so that it will burn in the open under control, and also should protect the exposures with water fog. The best approach may be through the office or the back window of the lube room. Consideration should be given to covering the lube room floor drain to prevent entrance of burning gasoline.

16495

UNIT IV — FREEHAND WORKING DRAWINGS

General Information

In this unit, Freehand Working Drawings, we are to make freehand sketches of simple objects in "orthographic" projection. This means that we make two or more views of an object, usually three views, with the views in a certain definite relationship to each other. For instance, the top view is always placed directly above the front view. In fact, one view is "projected" from the other. The right end view is placed to the right of the front view and is "projected" directly from the front view.

The reason why there is always this relationship between views will be shown by looking at Illustration Sheet 7 on page 37. On Figure 1 of the Illustration Sheet you will see that if a piece of glass is placed in front of the object and the surface of the object is reflected back to the piece of glass it will give us the outline we need to represent the front view. Now if we bring our point of vision around to the right side and look in at the right end of the object, the reflected image on the glass will give us the outline we need for the right side view. If we think of these two pieces of glass as being hinged together and then open them out into one flat plane, we see that the two views have a definite relationship to one another and are "projected" one from the other.

A look at Figure 2 will also show the relationship between the front view and the top view.

1647

Extinguishment. Water fog should be used to cool the fire and protect exposures until the gasoline is consumed. Should the fire be controlled, yet not extinguished, the firemen should attempt to extinguish it with a combination of dry chemical powder and water fog, making sure that proper quenching has preceded the extinguishment to prevent reignition. If the fire is very small, it may be extinguished with a portable hand foam extinguisher or other available hand extinguishers.

Overhaul. After checking to insure all sources of ignition have been eliminated, flush remaining unburned gasoline away, using water hose streams. When checking for sources of ignition, be sure to inspect the vehicle tires, upholstery, wiring, etc. If the station building is made of wood, use the normal overhaul precautions that apply to structural fires.

16496

12 TESTING UNDERGROUND GASOLINE TANKS

Oliver W. Johnson
Standard Oil Co. of California

When it is suspected that an underground gasoline tank or tank piping at a service station is leaking, it may be necessary to test the equipment. A simple and dependable method, which will be of interest to the fire service, has been used in the oil industry. (This paper was presented at the 1961 Bakersfield Oil Fire Control School.)

The following procedure is useful in checking the tightness of any buried gasoline storage tank. The equipment is simple and easily assembled from readily available materials; and if the tank is tight, the test can be completed in less than two hours. Unless this preliminary test shows some sign of leakage, there will be no need to uncover the tank.

Equipment

1. A piece of standard weight steel pipe approximately 4 feet long, 3 inches in diameter, threaded one end. For repeated use, the pipe should be equipped with a boiler gauge glass, close to the unthreaded end. If this is not readily available, readings of sufficient accuracy can be made by measuring from the top of the pipe down to the gasoline liquid level with a measuring tape or ruler.

2. Threaded bell reducer (or coupling and bushings) to connect the test pipe to the fill opening of the tank.

3. Gasoline can of 5-gallon capacity, preferably of the "safety" type.

Procedure

1. Prior to making the test, the tank should be filled shell-full with gasoline. (If two or more tanks are connected with siphons, all tanks so connected must be filled. Any manifold connections between tanks should be broken and the lines capped.)

2. Remove gasoline fill pipe cover and the fitting on which it screws, exposing the pipe thread on the fill pipe. By means of a coupling, bell reducer, or bushings, attach the test pipe to the fill opening. Threads

16497

must be in good condition, and must be made up gasoline-tight, using pipe dope if necessary. (Tightly cap the fill pipe of all other tanks connected to the test tank by siphons, as all tanks so connected will be tested as a unit.)

3. All pumps to which this particular tank is connected must be temporarily taken out of service. If the vent line from this tank is manifolded to that from any other tank, the vent line must be disconnected and capped; if the vent line serves only this tank, it need not be disturbed for the present.

4. Fill the test pipe by pouring gasoline into the top until the gasoline level is close to the top of the gauge glass, or within a few inches of the top of the test pipe. Make a preliminary inspection to see that there is no leakage at the point where the test pipe connects to the fill pipe of the tank, at the pump, or at any other point where piping is exposed.

5. Mark the gasoline level on the gauge glass, or accurately measure and record the distance from the gasoline level to the top of the test pipe. Cover the top of the pipe with a tin can to reduce evaporation.

6. Keep close track of the level of gasoline in the test pipe to detect signs of leakage. With a 3-inch test pipe, a drop of 1 inch in 10 minutes will equal a leakage rate of about 5 gallons per day. Since the test is made at a pressure several times that of normal service conditions, the actual leakage would probably be less. A tank is considered tight for practical purposes if the drop in the gasoline level in the test pipe does not exceed 1 or 2 inches in an hour, since temperature change and absorption of air bubbles will account for some change.

It will be noted that this preliminary test includes not only the tank, but also the fill pipe, vent line, and all gasoline piping up to and including the pump. If significant leakage is found, it will be necessary to disconnect the piping and repeat the test in order to prove that it is the tank which is leaking and not the pipe. Hence, if leakage is indicated, continue the test by taking the following additional steps:

7. Pump gasoline out of the tank through the service station pump to lower the gasoline level to the tank top. Uncover the tank and disconnect and cap the vent line connection of the tank. Refill the test pipe and repeat the test. If the leakage has stopped, this proves that the leak is in the vent line. If leakage persists, it must be either in the tank or pump piping, and another step will be necessary.

8. Pump out gasoline to lower the level in the test pipe, then disconnect and cap all gasoline lines at the top of the tank. Refill the test pipe

16498

and repeat the test. If leakage still persists, then it is the tank that is leaking, and appropriate steps must be taken. (When two or more tanks have been tested as a unit, this final test must be made on each tank individually.)

Discussion

It will be noted that the above procedure involves testing the tank and all associated piping as a unit, and that it is not necessary to dig up the tank or uncover the piping unless a leak is found. Since the majority of service station tanks will be found to be tight, they will usually pass the first test, and no time will be wasted in digging. Where leaks are found, some excavating will be necessary in any event, so that the time spent in uncovering the tank will not be wasted.

The same general procedure can also be used for checking the tightness of underground tanks storing other products, such as fuel oil. The test pipe should be filled with the same product as in the tank. Lines to burners, etc., must be disconnected and capped, and means must be provided for removing excess oil after the test is completed.

16499

13 LIQUEFIED PETROLEUM GAS

Oliver W. Johnson
Standard Oil Co. of California

By NFPA definition, LP gas is not a flammable liquid--mainly because it is handled, transported, and stored in pressure vessels, not in atmospheric tanks. Chemically it is similar to the light volatile components of gasoline. In fact, winter-grade gasoline contains dissolved butane for "quick-starting" a cold motor.

LP gas quickly vaporizes on release to air; bubbles up through, and is not extinguished by, foam; and can present a greater fire hazard than gasoline. Fire control of a fire-exposed pressure vessel of LP gas is different from that for a thin-skinned atmospheric tank of a similar size and shape, but containing gasoline.

LP gas often is extracted directly from the rich gas in the oil fields by means of compression, absorption, and fractionation to separate the propane from the butane. It may be manufactured in refineries and transported by trunk pipelines. Usually tank trucks or tank cars transport LP gas to the distributing plant, and tank trucks deliver it to the consumer.

Answers to many of the questions about LP gas that puzzle firemen are to be found in the following paper.

"Liquefied petroleum gas," as the name implies, is petroleum-derived gas, which is compressed into a liquid and stored and handled like a liquid under pressure. Its principal sources are natural gas produced with crude oil and the crude oil itself, from which it is separated in the refining process. The properties of LP gas reflect those of the better-known materials from which it is derived.

At atmospheric pressure and ordinary temperature, petroleum gas, like natural gas, is a colorless and odorless gas, which burns with a yellow luminous flame. However, it is somewhat heavier than natural gas, has a higher heat of combustion per cubic foot, and in some ways more closely resembles the vapors of the volatile liquid petroleum oils. These similarities are explained by the fact that all of these materials (those that are derived from petroleum and natural gas) belong to the same chemical family of hydrocarbons and that they are made up of the same two elements, hydrogen and carbon. The differences between them are the result of differences in the number and arrangement of the atoms that make up the molecules of each individual member of the family.

16500

LP gas may be either a relatively pure compound (propane, for example) or a mixture of two or more of the hydrocarbon gases (propane, normal butane, iso-butane, and the butenes). These gases may be condensed to clear, colorless liquids by cooling or (at ordinary temperatures) by compressing. The pressure required to hold them in the liquid state is called "vapor pressure." At 60° F the vapor pressure of pure propane is about 92 pounds per square inch of gauge pressure; that of iso-butane is 24 pounds; and that of normal butane, about 12 pounds. Mixtures of the liquids have vapor pressures intermediate between vapor pressures of the components. For example, increasing the proportion of propane in a mixture raises the vapor pressure; increasing the proportion of butane lowers it.

Vapor pressure increases with temperature. This fact is important because containers must be strong enough to withstand the maximum service pressure, and this resistance will depend on the maximum temperature that will occur as well as on the composition of the mixture.

When temperature of liquefied gas is lowered, the vapor pressure decreases. If n-butane is cooled to 31° F, its vapor pressure falls to 0 pounds gauge. At that temperature it is a liquid at ordinary atmospheric pressure. In a cold winter climate the appearance and behavior of butane would be very much the same as that of gasoline on a warm summer day. Stated another way, the boiling point of n-butane is 31° F at atmospheric pressure. The boiling point of iso-butane is 10° F, and that of propane about -44° F.

The effect of low temperature on the vapor pressure is important, because in many cases the pressure is relied upon to deliver the liquid or vapor to the point of use, and the system would fail to function if the pressure ever fell as low as 0 pounds gauge. For this reason the LP gas sold under various trade names for domestic use may consist of almost pure propane. For other uses, such as automotive fuel, the liquid may be composed largely of butane.

There are other differences in the properties of the three LP gas hydrocarbons. The density of the liquid and the vapor, and the heat of combustion, are greater for the butanes than they are for propane; and the rate of diffusion is slightly less. These differences are usually unimportant from the practical standpoint.

In the following discussion the expression "LP gas" will be used to designate the commercial liquefied gas ordinarily sold, irrespective of composition.

Containers

The principal way in which LP gas differs from other liquid fuel is that it must be stored and handled in closed containers under pressure. These containers,

16501

like the similar pressure vessels used for handling air or water, must be strong enough to withstand any pressure that may occur, even under extreme conditions.

Standards for the design and operation of LP gas installations are contained in Standard 58 of the National Fire Protection Association. This standard covers almost all phases of handling LP gas, and compliance with it will go far toward avoiding accidents.

When a prospective user wants to buy a steam boiler, the first question asked is, "What will the operating pressure be?" The same problem arises in procuring a tank for LP gas. The National Board standard requires that the design pressure of the vessel be stamped on it, and prohibits filling it with any product that has a vapor pressure exceeding the design pressure under certain specified conditions. Therefore, the user should know what product is to be used before a container is purchased. In many instances, to guard against possible future changes in specification, it has been felt desirable to purchase containers good for the highest pressure likely to ever be required, which is that for nearly pure propane.

Safety Precautions in Use

LP gas may be used in most places where either gasoline or natural gas is used. Safety precautions are similar to those for common fuels.

Although stored as a liquid, LP gas is always converted into a gas before use. For small installations (such as domestic service), this conversion is accomplished simply by drawing off vapor from the upper part of the container. As the gas is withdrawn, the pressure falls slightly, and some of the liquid evaporates to replace the gas withdrawn. For larger installations it may be necessary to carry the liquid to the point of use, and convert it into gas by releasing the pressure and supplying heat, in a special "vaporizor."

When LP gas is used in place of city gas, the pressure must be regulated and the flow controlled by valves, in the same way as for city gas and with the same type of equipment. Burners must have smaller orifices than they have for city gas, because of the higher heat value of LP gas, but otherwise appliances are quite similar to those used for city gas. When LP gas is used as an engine fuel, it is usually brought to the engine as a liquid, the same as gasoline; but a somewhat different type of carburetor will be required, incorporating a means of supplying heat to assist in vaporization.

Confined in pipes and containers, LP gas offers no hazard. If permitted to escape it may produce a condition that is in some ways more dangerous, and in some ways less dangerous, than a similar escape of gasoline.

16502

Fig. 18. The top photograph shows the simulated emergency fire with one hose crew ready to start cooling. The other crew is out of the picture to the lower right. In the lower picture both crews have hose streams properly directed to cool the tank shell above the liquid level in the tank.

16503

If Leaks Occur

A small leak of LP gas is similar to a natural gas leak, since the liquid will vaporize promptly; and if not ignited, it quickly dissipates. Since LP gas vapor is heavier than air, vapor released at floor or ground levels dissipates less quickly than that released at an elevation. When mixed with air in explosive proportions, both gasoline and LP gas mixtures have very nearly the same density as air, and the mixture may fill any space to which it has access.

When an accident results in the escape of LP gas, precautions should be taken, as with any other fuel, to try to prevent it from taking fire. Spectators should be kept out of the affected area, motor vehicles should not be operated, and every effort should be made to guard against any source of ignition.

If LP gas continued to escape, it is important to try to determine the source of the leak and to attempt to control it. It may be possible to close valves ahead of the break. If there are no valves, it may be possible to crimp the pipe and thus shut off the flow. Men should use every precaution to avoid ignition while working in the dangerous area. In some instances, a water hose stream is valuable in diverting the flow of gas or liquid, and thus assists in making a shutoff (see Fig. 83).

Even if the flow cannot be stopped, sometimes much good can be done with hose streams, which assist in vaporizing spilled liquid. The effect of prevailing wind may be intensified by removing fences or other obstructions. When the supply of LP gas is exhausted, the residual vapor will quickly dissipate. The area should be guarded until tests made with a combustible gas indicator show that ignitible vapors are no longer present.

If Fire Starts

If ignition occurs, first efforts should be confined to control rather than extinguishment. Since the limits of a fire are clearly visible, it is safer in some ways to work close to the fire than it is to work close to a source of leakage where ignition has not occurred. If any structures are exposed to the flame or are close to it, these should be protected with water streams, using spray, if available. It is possible to prevent the ignition of combustible structures, when they are close to the flames or even actually enveloped by flames, by spraying them thoroughly and continuously with water.

When escaping LP gas is burning at a point remote from the tank, it frequently is possible to control the fire simply by closing a valve. If possible, someone familiar with the piping system should be consulted, since he may know details of the installation that cannot be readily ascertained because of the fire. If

16504

valves are inaccessible because of the flames, it sometimes is possible to drive the flame away by means of a water spray or to reduce its intensity so that the valve can be closed. It may be possible to crimp a pipe under similar circumstances.

Where men must work close to the fire under protection of water sprays, it is very important to make sure that the flow of water is not interrupted. Two or more hose lines should be used, wherever possible, to guard against a hose break; and if the hoses can be supplied from different sources, it will be that much safer. Care should be taken that hooking up additional fire pumps does not rob water from hose lines already in use. Men should advance toward the fire under protection of the hose stream, and under no circumstances should the stream be turned off until the men are safely back out of the danger area.

Although small LP gas fires can be extinguished with water spray, or with portable dry chemical or CO_2 extinguishers, it is not ordinarily advisable to extinguish the fire unless it is certain that the gas flow can be shut off immediately. Portable extinguishers can also be used to control the flame and assist in making a shutoff. However, since the supply of extinguishing agent available from a portable extinguisher is limited, the fire fighter should be prepared to retreat rapidly when the extinguisher is exhausted.

A fire in LP gas usually will be less widespread than one of a comparable stream of gasoline, because the LP gas vaporizes and burns in one place, whereas the gasoline stream may flow and spread the fire over a greater area. Water may spread a gasoline fire, but an LP gas fire "stays put," and will not increase in intensity when a water stream is played on it.

If the flow of LP gas cannot be shut off, either before or immediately after the flames are extinguished, it is preferable to let the fire burn under control and to confine efforts to protecting adjacent property.

Where flame from any type of fire is in contact with a tank holding LP gas, the contents heat up, the pressure rises, and the relief valve opens. Most likely, escaping gas will ignite and burn in the air over the top of the vessel, producing a pillar of flame, which is spectacular but not dangerous. Relief valves on storage tanks built according to NFPA Standard 58 are adequate in size to release all of the gas produced by a fire of maximum intensity while holding the vessel pressure to a safe level.

The flame that heats the contents of an LP gas vessel to the boiling point usually also heats the portion of the shell above the level of the liquid. Here there is no liquid in contact with the steel to keep it cool. The steel gets hot and, in extreme cases, heats enough to lose its strength, and the vessel fails. For

16505

In Figure 3, we can see the relationship of three views of the object when viewed through a "glass box". If we think of the box as having hinges which will allow it to open out into one flat plane we can see the relationship of the three views and the fact that the views are "projected", one from another.

This system of "orthographic" projection is the basis for all working drawings and is used throughout industry in the design and manufacture of most commercial products.

Illustration Sheet 8, page 39, shows the way a slanting surface would would be represented in a drawing. Illustration Sheet 9, page 41, shows the method of dimensioning a drawing and Illustration Sheet 10, page 43, shows the uses of geometrical terms used in drafting. With experience in solving the relationship of views you will become familiar with this "language of industry" and will have added a knowledge and skill that will benefit you over and over in everyday use.

On the following plates you are to give all necessary dimensions.

1648

Los Angeles City Fire Department

Fig. 19. Cooling LP gas tanks above the liquid level while the fire burns itself out.

this reason, it is important to keep the top of such a vessel cooled with water streams in the areas where it is exposed to flame.

The need to concentrate available water on the areas where it is most needed cannot be overemphasized. Portions of the vessel shell below the liquid level are kept cool by the liquid inside. The liquid cannot be heated above the boiling point, which, at the set pressure of the relief valve, is not over 120-180° F. Water applied to a surface at this temperature does not have a very great cooling effect. On the other hand, the upper portions of the shell are out of contact with the contained liquid, and can heat quickly to a high temperature. Water streams applied to this area do the maximum amount of good. The areas in greatest need of cooling are those that are so enveloped in flame that they cannot be seen. These deserve first consideration. Streams should be directed from the sides of the vessel, and fire fighters should avoid taking positions in line with the ends, since if a horizontal pressure vessel fails, it usually moves endways.

Summary

So long as LP gas is confined in the tanks and lines provided for it and is used in the intended manner, it is no more dangerous than any other liquid or gaseous fuel. If the installation is made in a correct manner, in conformity with accepted standards of good practice, there is little danger of mechanical failure. By far the greater portion of accidents occur because of incorrect handling, sometimes as a result of neglecting obvious rules of safety. If good judgment and reasonable precautions are employed, the handling of LP gas need not be unduly hazardous.

Rules for Handling JP-4

It is evident that the tank vapor space atmosphere may be in the flammable range over wide temperature variations in the commodity and atmosphere. From the flash point, it is evident that, in the open, the material may be only slightly less hazardous than gasoline. From these two facts, it is possible to establish two broad specifications for fire prevention in handling JP-4:

1. The normal handling of JP-4 in barrels, cans, or tank vehicles requires precautions identical to those established for the normal handling of any flammable liquid. No smoking, open lights or fires, arc or spark-producing devices or nonvaporproof equipment should be permitted in the immediate vicinity. Requirements of NFPA Pamphlets 30 and 85 should be invoked.

2. Because the real problem is the flammable atmosphere in the tank vapor space, sources of ignition within the tank must be eliminated. This may be accomplished by using floating-roofed tanks or observing certain precautions in using cone-roofed tanks.

Use of floating-roofed tanks. The most certain method of protection is to use floating-roofed tanks. This completely eliminates the vapor space (except when the tank is substantially empty) and eliminates any possibility of static generation, accumulation, and discharge within the tank.

Precautions with cone-roofed tanks. Where cone-roofed tanks must be used, added precautions must be taken. The tank roof must be maintained in a vapor-tight condition, and vacuum pressure relief valves must be used. In other words, the tank should meet API 12-C tank construction specification.

- Flame arresters not only are of no value, but because of inevitable plugging, they may increase the hazard.

- Because fillers tend to corrode out, they may engender a false sense of security.

In a refinery--but not in a bulk plant--a gas blanketing system is valuable to insure that a rich atmosphere is maintained in the vapor space.

These operations conducive to the generation of static must be prohibited:

- Overshot filling with a line entering the top of the tank.

- Blowing the tank contents with air or with inert or flammable gas. Air pockets in the lines to the tank must be avoided.

- Pumping into the tank at such a rate as to cause violent agitation of the contents. This can be avoided by insuring that the nozzle velocity of the entering stream is kept at or below 3 feet per second until at least 6 feet of material is in the tank.

- Mixing water or any aqueous solutions with the contents of the tank.

Protective measures for cone-roofed tanks. Some regulations require the use of permissible flashlights, nonsparking hand tools, and shoes without nails. None of these is a reasonable requirement. Neither is the specification, which some companies and many legislative bodies have, that tanks must be "grounded" by driven grounds, with wires from the grounds to the tanks. Such devices are ineffective because static does not accumulate on the tank; static accumulates on the surface of the oil. The following protective measures, however, are effective:

- All steel construction, including lines, valves, fittings, and accessories should be required from the tank shell to a point at least outside the dike. If an explosion occurs as a result of ignition of the flammable vapor-air mixture in the tank's vapor space, the roof will blow off, even at tank diameters as low as 10 feet. Cast iron fittings in the lines leading to and from the tanks are almost invariably broken by the shock.

- A "gauging well" is a very valuable protective device. It consists of a perforated or slotted pipe, permanently affixed to the gauge hole and extending to the bottom of the tank. Accurate gauges can be taken in the pipe, with no possible static discharge from the oil to the gauge tape of the plumb bob. If gauging wells are not used, a tank should not be gauged with a conventional gauge tape or temperature-taker or sampled with a "thief sampler" until the tank has been quiet for a period of at least 15 minutes after the ending of the flow of the product into the tank.

Fighting JP-4 Fires

Fire fighting methods for JP-4 fires are identical to those for any other petroleum product. Fog is valuable for protection and control, and alone or with dry chemical extinguishers it is an effective extinguishing agent for open fires. If foam is to be required on other tanks in a particular installation, it should be specified for the JP-4 tanks.

Possibly some of the concern felt by those who question the use of routine fire fighting procedures for JP-4 results from a misunderstanding of the mechanism of the ignition of a tank fire. This may be clarified as follows:

Ignition of a tank fire. In order for a fire to occur in a tank, a flammable vapor-air mixture must exist within the tank vapor space. This may develop in three ways, depending upon the nature of the commodity.

1. The material is light enough that the tank vapor space normally will contain a mixture that is too rich to be ignited. Fires have occurred, however, as a result of the reduction of the concentration to within the flammable range by rapid pump-out, sudden atmospheric temperature drop, poor condition of tank roofs alone or associated with extraordinarily high winds.

2. The nature of the commodity (JP-4, some industrial solvents, and intermediate refinery products, for example) is such that the tank vapor-space atmosphere normally can be expected to be in the flammable range.

3. The material is heavy enough (kerosenes, stove oil, diesel fuel, and fuel oil, for example) that the vapor-space atmosphere is too lean to burn. Heating the commodity by means of steam coils, heat interchangers, or exposure fires raises the temperature sufficiently to raise the concentration of vapor to within the flammable range.

Results of ignition. If the flammable vapor-air mixture in the tank is ignited, regardless of the nature of the fuel that supplies the vapors, the roof will blow off.

- If the vapor concentration of the mixture is near the lower flammable limit, the explosion will be sharp, but the roof may not life completely. It may tear loose around the entire periphery of the tank and lift only slightly, or it may tear loose only in spots. In at least one case, the roof settled back in place and extinguished the fire. In others, the roof sagged into the tank.

- If the vapor concentration of the mixture is at or near the middle of the flammable range, the explosion will be sharp, and the roof probably will be blown completely off the tank.

- If the vapor concentration of the mixture is at or near the upper flammable limit, the explosion will be "low grade"--hardly audible. The results will be similar to those encountered in explosions of lean mixtures.

Position in the flammable range. The effects of ignition and the violence of the resulting explosion depend upon the relative position in the flammable range occupied by the concentration of vapor in the flammable mixture. It is true

16510

that the nature of the vapors has some slight effect. Thus, methane (natural gas) usually produces a more violent explosion than, for example, fuel oil vapor. If, however, the fuel oil vapor concentration was at the middle of its flammable range, and methane vapor concentration was just under its upper flammable limit, the fuel oil vapor explosion might be more vigorous. It follows that, although JP-4 is more likely to produce an ignitable flammable vapor-air mixture in a tank than any of the products on either side of it in the volatility range, it will not necessarily produce an explosion that is more violent. The application of shell-entering foam chambers to cone-roofed tanks, or the use of foam towers for floaters, therefore, is suitable regardless of the nature of the fuel.

*Mil-Military Specifications F-5624B (Washington, D.C.: U.S. Department of Defense), December 7, 1953, amended March 18, 1954.

**Calculated data.

It will be noted that the initial and 10 percent points are not specified in the table. Moreover, the nature of the crude oil has a profound effect upon the

16511

vaporization characteristics of the product. Accordingly, the tank vapor space atmosphere may be above the lower flammable limit at temperatures from to below zero to slightly above freezing. Similarly, the tank vapor space atmosphere may be below the upper flammable limit at temperatures from freezing to approximately 100° F. Storage at higher elevations--in Denver, for example--lowers the temperature range within which the product produces tank-vapor-space atmospheres within the flammable range.

16512

15 CHECKING COMBUSTIBLE GAS INDICATORS

Oliver W. Johnson
Standard Oil Co. of California

Most fire departments are equipped with one or more combustible gas indicators. These instruments sometimes are called "sniffers," "explosometers," or other similar names. Although the different types vary in size and design, they operate in somewhat similar fashion and are used for the same purpose--testing air for the presence of a flammable gas or vapor. In order to obtain a correct and dependable reading three conditions are necessary:

1. The operator must know how to operate the instrument and interpret the readings.

2. The instrument must be accurate and properly maintained.

3. The air-vapor mixture must be suitable for checking. It must consist only of air and the gas or vapor being tested. In other words, the mixture in a gasoline fuel tank that has been inerted with dry ice, CO_2, etc., cannot be tested.

The instrument has a definite range of use. The reader will recall from the papers in Part I what is meant by the "lower flammable limit" of a vapor-air mixture. For gasoline vapor it is about 1 percent. The instrument has an operating range from 0 percent to about 1 percent, and it will analyze a mixture in which the vapor content is less than the lower flammable limit. If, for a given sample, it reads 30 percent of the lower flammable limit, the sample contains about 0.3 percent vapor, indicating about how much more ventilation is needed to make the space or container gas free.

Gasoline vapor has a distinct odor. A man with a trained, sensitive nose can recognize gasoline odor in clean air in concentrations as low as 0.03 percent, but obviously smelling is not a reliable method of analyzing air for gasoline vapor. A combustible gas indicator can detect a trace of vapor (less than 10 percent of the lower flammable limit or 0.1 percent), and it should be used to secure dependable results. An undependable reading is worse than none at all, because it may lead to a false sense of security.

The purpose of including the following paper is to describe what steps are needed to check an instrument to see if it is in good working order. The author is the co-inventor of the J-W indicator, and as he states, the principles described apply to indicators of any make. (This paper was published in the manual of the 1961 Bakersfield Oil Fire Control School.)

Everyone who may have to test the atmosphere for flammable gas or vapor to determine if it is safe for man or free from fire hazard should become thoroughly familiar with the operation of a combustible gas indicator. He should be able to ascertain that the instrument is in good operating condition.

16513

Test for Gas Indicators

The following simple tests, needing no special equipment, meet all usual requirements:

1. Turn on the current and adjust the voltage to the correct value. This tests the batteries. (With the J-W Sniffer Model G the current is turned on by rotating the bulb, and the voltage is adjusted by turning the right-hand knob to bring the meter hand to the green line when the voltage test button is depressed. Other models or makes of indicator may require slightly different techniques.)

2. Lift the zero adjuster knob to engage the clutch, and turn the knob, observing that the meter hand moves freely. (In J-W Models F and G, the zero adjuster knob is the left-hand knob.) This test and the next cannot be completed unless the filament and all electric circuits are intact and operating correctly.

3. Work the aspirator bulb to draw fresh air through the instrument. This dispels any vapor left from a previous test. Observe that the meter hand fluctuates slightly each time the bulb is pressed. Set the meter hand to zero.

4. Place a few drops of gasoline on a cloth, hold it close to the sample cock (handle turned to the right), and work the aspirator bulb slowly. The meter hand should rise up on the scale. (If it flies to the top of the scale, or if a slight explosion is heard inside the instrument, no harm has been done.) Purge thoroughly and check the zero setting.

   This test proves that the indicator responds to combustible gases. It need be made only occasionally--never more often than once a day.

   In making the test, avoid using an excessive amount of gasoline, which might result in drawing liquid into the instrument, making it difficult to purge. When the indicator is to be used predominantly for testing for natural gas, it is preferable to use natural gas for this test rather than the vapor from gasoline. There is available a test kit, which includes breakable glass ampoules containing enough natural gas to make a calibration check.

   If the instrument is to be used by carrying it into the suspected space, no further testing or adjustment is necessary. If the instrument is to be used with a "sample hose," which draws samples from a remote location, one further step is necessary--to make sure that the sample is actually gas drawn through the hose, not fresh air drawn through the air opening in the sample cock.

16514

5. Observe that, when the handle of the sample cock is in the upright position, air is drawn in through the hole on the right-hand side of the body, and that when the handle is turned horizontally to the right, the sample is drawn in through the threaded connection. The handle must be turned to the right when drawing the sample through the sample hose. To check this, connect the sample hose, and place a finger over the end of it while operating the aspirator bulb, which should remain flat until the finger is removed if all connections are tight. As an alternate test, place the end of the sample hose close to the ear and listen to make sure that the sample is actually entering the end of the sample tube.

Maintenance of Gas Indicators

Tests 1, 2, and 3 should be made prior to every use of the indicator. The fact that the voltmeter can be set to the correct point and that the indicator meter hand responds to the zero adjuster proves that the instrument is ready to use. It is good practice to repeat Test 3 after every test in which vapor is encountered, in order that the indicator will be purged of vapor and ready for the next test.

To conserve the battery, be sure that the switch is turned off except when the indicator is actually being used.

Inability to set the voltmeter to the correct point (Test 1), or rapid falling of the voltage during use, indicates weak batteries. Replace them. Jerky or

Fig. 20. Two types of dials used on combustible gas indicators. The upper scale is graduated in percent of lower flammable limit. In the lower scale the graduations are in tenths of the lower flammable limit with smaller subdivisions. Such instruments cannot indicate directly percentage concentrations above the lower flammable limit.

erratic motion of either meter hand indicates loose connections. Tighten them before using. If the hand of the indicator flies to the top or bottom of the scale as soon as the switch is turned on, and fails to respond to the zero adjuster, it indicates either a burned-out filament or a loose connection of the filament. If the indicator meter hand follows the zero adjuster but cannot be set to zero (Test 3), this indicates either a loose filament connection or that the filament has reached the end of its useful life.

Conclusion

If the routine described above is always followed, the operator will become thoroughly familiar with the performance of the indicator, and he will have confidence in the results of his tests.

16516

16 ECONOMICS OF FIRE PROTECTION

C. E. Williams
Standard Oil Co. of California

The economics of fire protection is a very important subject. Everyone is concerned whether it relates to his home, his ranch, his car, or his bulk plant, if privately owned. On a much larger scale it may relate to an oil refinery. Obviously, built-in fire protection that can handle every conceivable emergency, regardless of how great, cannot be justified financially. Many factors must be considered. In the following paper this subject is discussed in some detail. (Mr. Williams presented this paper at the Bakersfield Oil Fire Control School in 1961.)

In a discussion of fire protection it should be understood that the term "fire protection" includes all phases of fire prevention, fire control, and fire extinguishment. None of these phases is more complicated than finance.

Every fire chief knows that, to get approval for his budget, he must demonstrate to his superior, and possibly also to the public, that the cost of operating his department will bring a commensurate return in the form of decreased chance of injury or loss of life, reduction of fire loss, and decreased fire insurance premiums. Some of these factors are easily expressed in dollars; others are largely intangible.

Fire protection is not acquired without cost. However, it should be considered an investment--not an expense, and certainly not a speculation. Before the average person spends his money or his time, he analyzes the probable return on his investment. When we purchase a home or invest our money, we consider every detail. Certainly, an investment in fire protection, upon which the safety of a larger investment depends, is just as worthy of scrutiny.

Every fire protection engineer knows that, when he submits a recommendation for an expenditure to cover the cost of equipment or a change in design calculated to reduce the risk of fire, he must be able to show not only that the expenditure will accomplish all that he claims but also that there is no simpler or more economical way to accomplish the same result.

Probable Loss without Protection

Before we can determine the probable loss by fire, we must have some idea of how frequently fire can occur in the facility under consideration. This should

16517

not be based on a few individual cases, but if possible, should take into account the total fire experience in similar installations in other plants. For example, the annual fire loss data compiled and distributed by the American Petroleum Institute provide a good index for different types of oil properties. Studies of insurance-rating schedules and rates on different classes of properties or facilities show relative risks of fire. Also, we should consider exposures, improvements in construction, and fire-extinguishing equipment available for the protection of the installation in question. Are these items better or worse than were provided for the average installation from which the data were developed?

Fire frequency. In a like manner we can develop data on frequency of fires involving different types of equipment. When the problem involves truck deliveries of flammable liquids, comparison of the number of tank truck fires with the number of gallons transported or number of vehicles in use gives a reliable frequency figure.

Direct damage to property. Fire frequency is important, but we must also know what the direct monetary loss would be if fire did occur. We must consider the replacement value of the structure, the probable time required to restore the unit to operating efficiency, the production losses that may occur during this time, the chance that the fire may be controlled before the structure is completely destroyed, and the possibility that the fire may spread to other structures.

Damage to exposures. Exposures should be appraised in the same manner to establish their probable loss values. Exposures or lack of them, often are overlooked in estimating the importance of possible fires. Similar properties or facilities, with different exposures, may require entirely different fire protection. It is difficult to arrive at an exact figure when answering these questions; yet it is usually possible to arrive at a fair total.

Intangible losses. The most difficult problem is to evaluate the intangible losses associated with a fire. These may include possible injury to personnel, loss of production, interruption of business, adverse public opinion, and similar considerations. Here again most of the figures are opinions. Experience, however, has shown that by breaking down the problem and making several assumptions, we can arrive at a more accurate figure than by guessing. If public opinion is adverse, the intangible losses may be greater than the monetary loss. This is particularly true when there are fatalities. A single death resulting from an explosion or a fire will arouse more concern than a number of deaths resulting from a traffic accident. Good will is a valuable intangible asset; and as we all know, serious or spectacular fires may create ill will and provoke public demands for extreme and costly measures of protection.

16518

Probable Loss with Protection

So far we have dealt with conditions as they exist without protection. The next problem is to repeat the process, estimating what the loss might be with protection. In other words, to what degree would the proposed protection reduce the possible loss by fire? At first glance the installation of vaporproof lights at a truck loading rack may seem important. To what degree, however, would it reduce the possibility of ignition? At first it seems apparent that the installation of vaporproof equipment could greatly reduce the probability of fire, but further study shows that electrical equipment is not the only source of ignition in the area. Trucks, which are entering and leaving the rack during loading operations, have electrical systems that are not vaporproof and engines that may present hazards as well. These trucks are operating near ground level, where vapors are more likely to collect than up near the lights. So how effective in preventing ignition would the installation of vaporproof lights be in relation to all the other sources of ignition about which nothing would be done?

We now have two figures: first, probable loss without fire protection, and second, estimated loss with protection. The difference between these two figures constitutes the return of our fire protection investment. However, we still do not know the amount of the investment.

Fire cost factors. Now let us summarize what we have covered to this point. In any estimate of loss without protection and then loss with protection, the cost factors to be taken into account are:

- Fire frequency
- Direct damage to property
- Damage to exposures
- Value of loss of use and income
- Possible loss of life
- Possible effect of a fire on the public

Cost of Protection

It is not difficult to determine the cost of fire fighting equipment or fire resistive construction. These may represent, however, the smallest part of the cost. We must also consider the cost of maintaining the equipment. If it is manually operated, how many men are required to operate it? Are there enough men available, and can they be spared for direct fire fighting? What would it cost to train men to operate the equipment efficiently? What effect would this expense have on the plant operating costs? The answer to the last question frequently presents the greatest cost of fire protection. Changes in design or revisions in operating or maintenance procedures, because they

16519

involve a hazard of fire, may require the adoption of more costly procedures or may lower production and revenue. Such costs should be considered part of fire protection and included in estimating the proposed investment. Fortunately, good operating designs and good operating practice usually add up to good fire protection.

Now, what has been accomplished in this analysis? The cost of protection has been estimated by taking into account the cost of installation, maintenance, and operation. The estimated saving in fire loss by reason of the protection has been established by evaluating the probable loss with and without protection. The difference between these two figures should give us a rough idea whether the protection is a justified investment.

This may seem like a cumbersome way of arriving at what appears to be a simple answer. During the course of the analysis, however, a better way for accomplishing the same purpose may present itself. The various plans should be studied in order that the most economical one may be selected. It should be remembered that the cheapest method of meeting the legal requirements may not be the most economical in the long run. However, any part of the investment above the cheapest way should be shown to be profitable.

A Fire Training Program

In our company the fire fighting training program is considered to be one of the major factors in reducing loss by fire. The installation of fire fighting equipment in any plant is of little use unless the employees are trained to use the equipment efficiently. Instruction and drills in all phases of fire emergency should be systematically given to stress the importance of fire protection to all plant personnel. Each employee should know how to turn in a fire alarm. He should know the location of fire fighting equipment in the area where he normally works, and know how to use it. So far as practicable, each should be given actual experience from time to time in handling the equipment on small test fires simulating, as closely as possible, actual situations that may occur under operating conditions. Periodic inspections of such equipment should be made by the men likely to use it. This will serve to remind them of the importance of prompt and effective action in curbing fires in their incipient stages.

In addition to its direct result of improving fire control, fire fighting has an important indirect benefit. It develops fire consciousness in employees, who become more alert to prevent fire. The records seem to prove this.

We work closely with our design engineers to select and properly place fire protection equipment. This requires a close check of plans before construction and a continuous "on plot" check during construction. Through the

16620

cooperation of design engineers, operating personnel, and fire protection personnel, the most benefit from fire protection effort can be obtained.

You will agree that no one can become expert solely as a result of his own personal experience. We all depend on each other to complete our knowledge. One of the important gains from training programs such as the Bakersfield Oil Fire Control School is the opportunity it gives to meet and talk with other people, to learn their points of view and hear about their experiences.

16521

17 LET THE FIRE BURN

This paper and the subsequent materials in this manual did not appear in the manuals of the 1955 or 1961 Oil Fire Control Schools at Bakersfield. They were prepared especially for this manual by James E. Hill, formerly with Union Oil Co. of California. One exception is Section 5 of Part III, which includes the questions and answers used at these two schools.

In some cases it is better to let an oil or gas fire burn out under control than to extinguish it. This is particularly true for fuel gas or LP gas if the source of the fuel cannot be shut off quickly. "Whitey" Klaus points this out in the first paragraph of "Principles of Oil Fire Control and Extinguishment," the first paper in Part II. It is always a challenge, of course, to extinguish a fire promptly. The reasons why some fires should not be extinguished but should be permitted to burn out under control are brought out by the following examples.

Gas Fires

Assume that a major leak in a buried domestic gas line in the middle of a street has ignited. It could be handled in one of two ways: (1) Possibly the fire could be extinguished with dry chemical under the protection of water fog. (2) The firemen could stand by and protect exposures until the gas company shuts off the line and while the line depressures. Which one of the two is the safer method? Under most circumstances, it would be safer to let the fire burn out under control.

First, assume that the fire was extinguished and the odor of the gas is slight. What is the risk of reignition if all spectators are kept away?

Natural gas usually consists of methane and ethane. Methane is about half as heavy as air and ethane has the same vapor density as air. The mixture, therefore, is lighter than air, and it will rapidly disperse upward from the street. Also, the lack of a strong odor indicates that the gas has not reached its lower

16522

flammable limit, which is 5 percent for methane and 3 percent for ethane. (Some cities that are not close to sources of natural gas manufacture their own odorized gas from propane and butane.) At these concentrations the odor is very strong. Therefore, an unburning gas leak that is well out in the open where it can dissipate quickly is not particularly hazardous unless a thoughtless spectator tosses a burning match into it to see if it is flammable.

If the gas has ignited, however, it is best to let it burn out. The vapor of these gases in pure form is somewhat heavier than air, and if the flame is extinguished prematurely, serious problems can develop in a confined area where no wind disperses the vapor.

LP Gas Pipelines

In full concentration, or 100 percent pure, propane is 1.5 times as heavy as air, and butane is twice as heavy as air. If a vapor leak of these gases is small, a slight breeze will dissipate it quickly. The flare pot tests at Bakersfield proved that point, as illustrated in Fig. 83. If the leak is already burning, however, it would be better to let it burn out under control, just as with natural gas. In some areas in California, casinghead or "natural gas," as it is called, flows in liquid form in a pipeline from the oil fields to refineries. It consists mainly of propane and butane, and it is unodorized because it is not a product for direct domestic use but is used in bulk commercial transportation. When released on the ground in quantity as a liquid, under little or no wind conditions, the vapor tends to hug the ground and drift a considerable distance before it is dispersed. A small breeze will hasten the dispersal, and a strong wind will disperse it quickly. The hazard may be appraised with a combustible gas indicator.

Should an unignited release of LP gas be deliberately ignited? One can imagine situations where early ignition would be desirable. No simple rules apply because each situation must be judged on its own merits. Prefire planning sessions may include this problem where applicable, and proper consideration should be given to the safe ignition and burning of the gas.

If a jet of vapor or liquid is projected well into the air under pressure, the vapor or spray usually disperses rapidly, much like steam. At the two Bakersfield Oil Fire Control Schools, butane liquid was released into an open ground area surrounded by flare pots to demonstrate vapor drift, rate of dispersal, and ability to accelerate dispersal with water spray streams, as illustrated by Fig. 83.

If a leak from an underground natural gas transfer line is ignited, it should be permitted to burn out under control. If a leak from equipment above ground is ignited, the same principle applies, although under some circumstances

16523

the control measures may be more difficult. In Part II, Mr. Johnson's paper entitled, "Liquefied Petroleum Gas," contains a good discussion on handling various emergencies of this type.

Gasoline and Other Liquid Fuels

Under some conditions a fire from a large spill may directly expose surrounding property and should be extinguished, if possible. Under other circumstances the fuel may be flushed away from exposures with water to a point where the flames do not contact exposures. In that case it may be advisable to let the

Fig. 21. A surprisingly small amount of water is needed to prevent the paper from igniting from the butane flame. When a garden hose is unavailable, a 1-inch fog will do, although it supplies too much spray for this demonstration.

fire consume all of the fuel, under control. This minimizes the following clean-up job and, in the case of a gasoline spill, eliminates the reignition risk.

Flaring or Burning

There have been cases where an LP gas or gasoline tank truck has been involved in a serious accident with or without fire, and (after extinguishment, in case of fire) there is the problem of disposing of the remaining liquid fuel. Sometimes it is impossible to pump it off into a salvage truck. In such cases, it may be advisable to pipe it away to a safe distance from the tank and burn off the excess product.

There have been cases where an almost empty storage tank has caught on fire and the side walls have been so badly damaged that the tank was worthless.

16 524

The cost of extinguishing the fire may be much more than the value of what might be saved. In such cases the fire will be permitted to burn out under control.

Summary

Each case must be judged on its own merits. There have been cases where gas or vapor fires should not have been extinguished, and reignition has injured firemen. In some other cases involving heavier oils, unnecessary extinguishment has created a serious clean-up problem.

18 USING FOG NOZZLES ON OIL FIRES

One of the most important techniques for a fireman to learn in order safely and effectively to combat many flammable liquid and LP gas fires is the proper handling of fog nozzles. A fireman who is experienced in the use of fog nozzles for structural and other fires not involving oil or gas may not know these techniques, and he may unknowingly expose himself and other firemen to unnecessary danger.

Special techniques have been developed on drill grounds that are designed specifically for fighting oil and gas fires. These techniques have been used successfully in the control and extinguishment of large fires. Some large fires cannot be controlled effectively without these techniques.

Types of Fog Devices

All fog devices have as their primary function the breaking up of water into fine droplets. Some whirl the water stream under high or low pressure; others cause the dispersion by impinging streams of water against each other or against metal plates by either internal or external impingement design. Because of the wide variety of uses and methods of dispersal, it is helpful to outline the scope of these water distribution devices.

I. Portable (as on hose lines)
   1. Fog nozzles (adjustable)
      a. All-purpose nozzle (fog or straight stream, or applicator)
      b. Combination (fog through spray into straight streams)
   2. Fog heads (nonadjustable)
      a. Volumetric (low velocity to fill a space)
      b. Directional (to project pattern toward a single target)

II. Fixed systems
   1. Distributor heads (not true fog heads)
      a. Conventional sprinkler heads, mainly for Class A protection
      b. Spoon, dish or nonfogging heads to cover a surface with a thin sheet or skin of water
   2. Fog heads (true fixed fog systems)
      a. Volumetric (low velocity to fill a space with fog)

16526

b. Directional (to project patterns toward a single location or apply a fan or curtain of fog)

Fire inspectors may have seen various kinds of fixed systems in the more modern installations in large plants. The nonfogging heads are used on some LP gas tanks and the conventional fog heads in all other places. Most of the most modern portable nozzles used by refinery fire departments are the combination type, operating from about 75-150 psi. Extensive tests with the high pressure nozzle (about 400 psi) showed less efficiency on oil fires, possibly because of the induction of air into the high velocity stream.

History of the Fog Nozzle

Chief Glen Griswold of the Los Angeles County Fire Department was responsible for the early testing and development of the fog nozzle for combating oil fires. In the 1920's and 1930's, he was stationed at the old Santa Fe Springs oil fields, where he had much experience with fires involving oil wells, oil tanks, and gas absorption plants. He found that even coarse water spray was effective in reducing flame size and radiant heat. The chief reasoned that, if coarse droplets were good, a finer spray would be better. He knew that a great deal of heat is absorbed when water spray evaporates and that the rate of heat absorption increases with smaller droplets. He also knew that the smaller droplets remain suspended in the air longer, that they form a denser pattern, and hence, are more efficient in reducing flame size than coarse spray using the same amount of water.

After considerable experimenting with various prototype nozzles on the fire drill ground at the old Station 17 at Santa Fe Springs in the early 1930's, he developed an impinging stream, fan-pattern type. After he patented it in 1931, the nozzle was manufactured. Insofar as is known, this was the first practical fog nozzle that was made commercially and used in this country.

Terminology. For a time the use of the term "fog nozzle" was controversial because some people contended that "spray nozzle" was correct. Most firemen prefer the term "fog" for a nozzle designed to produce very small droplets. The term "spray," they feel, more clearly defines the coarse droplet pattern that is produced when fanning a straight stream or using a conventional fixed sprinkler head.

Fire drill grounds. During the early part of World War II the navy nozzle was most popular. It was used extensively at the navy drill grounds when teaching sailors how to fight mainly gasoline and diesel oil fires. At the same time some oil refineries developed their own fire drill grounds and started using the all-purpose navy nozzle.

16527

Fig. 22. Chief Glen Griswold was with the Los Angeles County Fire Department for many years prior to joining the U. S. Army Engineers in World War II. When an army captain in charge of a large civilian area in Naples, he was killed by an explosion in an ammunition storage depot.

16529

Long Beach Fire Department

Fig. 25. Long Beach Fire Department testing two types of Griswold nozzle in 1936.

Since refineries and other oil operations grew in size during the war, it was important that refinerymen learn the best techniques to handle the new nozzle at their fires. This training was done often on large oil fires, and local municipal and county firemen were invited to participate. The earliest training was done with the navy-type nozzle. As newer and more efficient designs became available, they were tested by the refinerymen, and the better designs were

16530

adopted. At the same time, techniques in the best use of the nozzles also were developed.

Fig. 26. A steel panel board is one of the best props for showing how water fog absorbs heat. This early photograph shows Chief Cooper instructing. Panel boards can be used with various fuels and various methods of releasing fuels.

Most firemen are familiar with the old type of navy nozzle. With a side lever it could be used either on full fog or full straight streams. Also there was a connection for attaching a fog applicator. The applicator pipe was fitted with a fog head that produced a soft low velocity or volumetric-type pattern while the conventional head produced a high velocity stream with a directional pattern. Figure 27 illustrates a fireman using an applicator on a navy nozzle at one of the early refinery drill grounds, possibly in the 1940's. Figure 28 shows firemen using a later type of directional fog nozzle on the same tanks.

16531

Fig. 27. In a shallow, large-diameter tank it is practically impossible to extinguish a gasoline fire with water because convection currents carry away the steam smothering blanket too rapidly. A fire involving a high flash oil, however, may be readily extinguished in the same tank with the same nozzle.

Fig. 28. Under these circumstances it is more difficult to extinguish a fire with directional fog from a conventional nozzle than with volumetric fog from an applicator.

Using Common Nozzles

Most fog nozzles used today are variations of the adjustable or combination straight stream and directional fog nozzle. The fog pattern is more dense and the stream has more drive near the nozzle than out at the outer fringe of the fog stream. This difference in drive and density of pattern is most important, and the experienced fireman knows how to take advantage of it in protecting himself when cooling the flame. It is the purpose of this paper to describe these techniques.

The one-nozzle approach. Let us assume that there is a flame about 8 feet high and 4 feet wide at the base and that a fireman wishes to move into the edge of the fire and close a small valve that is supplying the oil fuel to the fire. This valve is about 12 inches above ground. He is alone with a 1-inch booster line or a 1-1/2-inch line and realizes that to kill the fire he must close the valve and shut off the source of fuel. He sets his nozzle on the full-fog adjustment with about a 90° pattern. The size and intensity of the flame may

16537

change while he is at the valve, and he must have maximum protection from both radiant heat and the flame itself. If he moves in with the nozzle at waist height, pointing straight ahead, the fog pattern will be about like that shown by Fig. 29. The danger points are shown by the shaded areas, where the flame may whip around the bottom or top edges of the fog patterns because the drive and water fog density are the least.

Fig. 29

As he approaches the valve, he squats down somewhat, as illustrated by Fig. 30. His head will be closer to the nozzle, with better protection and the risk of fire whipping around his feet is reduced. The nozzle is still in a horizontal position. He can improve his safety if he will tip up the nozzle slightly as shown in Fig. 31. Note in Fig. 31 that the drive of the pattern near the valve is improved when the nozzle is held at a slight upward angle, and the fog pattern at ground level has a better sweeping or driving action. It is true that the fireman will be squatting in a somewhat more awkward position than that shown in

Fig. 30

Fig. 29; therefore, he cannot retreat so fast as he can when standing upright. Close to ground level, however, the tilted nozzle makes a denser forward-driving pattern and provides protection against a flashback along the ground. The vertical top part of this pattern gives good protection from overhead flash.

Fig. 31

The stance and pattern shown by Fig. 31 have been found by trial and error to be the best to use with nozzles where the target (the valve) is below knee level.

16533

If the target is higher and larger nozzles are used, the stance and angle of the nozzle should be adjusted to suit the particular problem. Experience is the best teacher, and training on the drill ground with different kinds and sizes of fires is a "must" to gain proficiency. The most difficult problem in such training is to break down old prejudices and practices. Firemen, like other people, are resistant to change. If they use the horizontal, belt-level approach with booster lines on Class A and structural fires, they may feel that it also is

Fig. 32

best for oil and gas fires, regardless of the location of the target. Oil fires, however, unlike Class A fires, may change in intensity very rapidly, and it is only through open-minded, serious training that the new techniques may be learned and remembered.

The retreat from any oil and gas fire may be more important than the approach because of the risk of reignition and reflash. This is the most common argument against the low angle stance when not used correctly. It is most essential that backup men on the hose also be trained properly to aid the nozzle man while he makes a retreat. The nozzle man must not trip and fall over his own hose,

Fig. 33. Bird's eye view of one- and two-man approach to a shutoff valve.

16534

Fig. 34. The left-hand sketch illustrates a typical ground fire approach. At right is an elevated fire, with the 1½-inch nozzles tilted up for protection. For added protection the captain is using a booster line.

for serious injuries may result either from burns or from a loose, whipping hose. Close to the target, the nozzle must be held low to maintain the proper protection, and after a few steps backward, the nozzle man can rise and back off at a higher stance. A careful, deliberate retreat is essential. Under all circumstances the nozzle should not be shut off until the men are completely out of danger.

The two-nozzle approach. When two hose lines are available, it is good to use them, but the nozzle men must learn to work in unison with proper teamwork. This is most important when the size of the flame is almost beyond the capacity of the two nozzles. As a general rule the nozzle men and the men on the hose close behind them should be on the inside of the inverted "V" lay of the two hoses. If one of the men is right-handed, he should stand on the

left side so he can close the valve with his right hand. As the men approach the valve, the two fog patterns should overlap as shown in Fig. 40, and the final stance for each nozzle should be as shown in Fig. 34, if the valve is near the ground level. The forward speed should be slow and deliberate as they move in. The main objective is to get the valve closed promptly without injuries (see Fig. 36).

Assume that the main fire shifts to the right. If the right-hand nozzle man swings his nozzle to the right, it may open a gap between the two fog patterns, and both men may be burned by the flame that can whip through the gap. They may jointly veer their overlapping patterns to the right, back off, and size up the job again. Two or more trials may be necessary, or they may have to wait for help.

If the fire remains constant, they may be able to move in close to the valve, with the left-hand man taking charge so as to use his right hand for the shut-off. By carefully and constantly sizing up the problem while deliberately

16536

moving in, they will finally get in close enough for the left-hand man to reach in and touch the valve. At that time the left-hand man's attention will be devoted mainly to getting the valve closed, while the right-hand man must watch the overlapping fog patterns. When the valve man is ready, he should shout to his companion that he is ready to try to close it.

This is the critical period in which the right-hand man must watch out for both of them. There is a tendency for some overconfident, foolhardy men to rush in to make a fast shutoff and get out fast. From the standpoint of risk to himself and crewmen, that is about as smart as dashing across a roof that is ready to cave in.

When the valve is closed, the fire may continue to burn vigorously from the fuel on the ground, and the proper backoff again is important. Firemen behind the nozzle men must be alert to keep the hose out from underfoot to avoid tripping, particularly by the nozzle men.

When teaching firemen to close valves, the instructor should start with small fires with the valves near ground level, as shown in Fig. 30. One student may be taught how to approach the valve correctly, first without a fire and then with fire. Then the fire can be enlarged and two hose lines can be used, as in Fig. 44, first with and then without fire. Then similar fires can be handled, with the valve knee high or higher, and the different approach taught.

Los Angeles City Fire Department

Fig. 37. The low approach is particularly good where the water supply is limited and one of the objectives is to sweep the ground fire away from under the valve while closing it.

16537

Fig. 38. When a ground fire cannot be flushed forward, it is important that the nozzles be adjusted and tilted to provide the best drive to overcome this problem.

Los Angeles City Fire Department

Fig. 39. Firemen preparing to move in to close a valve that is supplying butane fuel to a fire. This is the climax of classroom and drill ground training.

16538

After the men receive careful individual training, they are ready for handling larger, more complex fires, as shown in Figs. 45, 46, and 47. Too often rookies are given advanced training on large fires without the primary training on smaller fires.

Fig. 40

Two-nozzle approach with captain. When three front men are available, it is good to use all three with a two-nozzle approach. Then both nozzle men can give their full attention to their nozzles, and the third man or captain can direct the crew and make the shutoff. (See Fig. 34 and 35.)

Obviously, at least two men for each nozzle are essential when using 2-1/2-inch lines because of the reactions of the nozzles and the stiffness of loaded hose lines. The captain should be in full charge, and the men should take all

Los Angeles City Fire Department

Fig. 41. Approaching a high fire for valve shutoff where the nozzles will be held waist high for the final approach.

16539

of their orders from him and not shift the direction of their streams or alter their fog pattern until he so directs.

Two types of approaches have been used successfully, the dual approach and the single approach.

1. Dual approach--After sizing up the job, the captain spots the nozzle men on each side of him, and he has them adjust their nozzles to the desired angles of fog pattern before starting to move in. Then he places his hands on his men's shoulders, and the three move forward as a unit. The captain moves slightly behind his two nozzle men to direct the overlap of their fog patterns. (See Fig. 35 and 47.)

   It is preferable for another captain or experienced man to remain in the rear in charge of the hose men to make sure that the hose is laid out in such a manner that, if a hasty retreat is needed, this hose does not interfere with the back-off movement. This is particularly important where the footing is insecure because of mud, oil slick, or irregular terrain.

   When the three-man crew gets close to the valve, the captain continues his instructions by voice and hand pressure on the shoulders of his men, or if the noise is severe, by hand pressure only. The low approach, as illustrated in Fig. 31, should be used when close to a ground-level target. The captain sets the proper overlap fog pattern and reaches in to close the valve. Sometimes it may be necessary for him to crawl in, practically on his stomach, to get at the valve, and his safety may lie entirely in the hands of the nozzle men, as illustrated in Fig. 48.

2. Single approach--The single approach is the same as the dual approach except for one feature. Instead of moving the two nozzle men together, when the three front men are about 15 feet or so from the valve, the captain sets the overlap pattern. One nozzle man freezes his stance as the captain edges the other nozzle man forward a foot or so into a frozen position. Then the captain returns to the rear nozzle and moves it forward past the closer nozzle and freezes it. He continues this positioning technique, moving one nozzle man at a time until they are together at a point close to where they will be when he closes the valve.

   After sizing up the character of the fire and effectiveness of the two overlapping fog patterns, the captain finally waits a moment or two to see if the fire appears to be unchanging, and then he tries to close the valve. He may find it necessary to make other adjustments of the nozzles before he is satisfied that they are positioned properly for him to devote his full attention to the valve and make the shutoff.

16543

Fig. 48. The position and stance of the captain and his two nozzlemen vary depending upon the location of the valve, the character of the fire, wind direction, etc. The two backup men will be the nozzlemen on the next shutoff.

Fig. 49. Some drill ground instructors have had difficulty using LP gas jet burner pipes at high delivery rates because the flame may blow itself out, especially when handled with a fog nozzle. Care must be taken to avoid self-extinguishment because the fire might reignite on some undetected ember and the reflash injure the fireman when in close. This drawing shows a special type of LP gas burner tip that will not blow itself out. The tip is not applicable to LP gas props shown in Figs. 83 and 93.

Both the dual and single approaches are used by experienced fire fighters, but it has been found that the single approach may be needed when the job is particularly difficult. After the valve has been closed, a dual retreat is used nearly always.

Backup lines. In some cases it may be necessary to use other fog lines to remove the radiant heat from severe overhead or side fires, or for possible added protection of the three front men should there be a quick increase in the intensity of the fire.

Sweeping ground fires. If the accumulation of burning oil on the ground makes it hazardous for the front men to reach their target, additional straight streams may be needed to knock the ground fires away from the front men.

Cooling equipment. It may be also necessary to cool close-by vessels or tanks that are exposed to direct flame contact, and more lines may be needed.

16544

Fig. 50. Refinery training ground prop with gasoline fuel flowing down the sides of a vessel. The problem is to close a fuel supply valve on the side of the vessel about 4 feet from the ground level. One stream is sweeping the fuel from above the valve and the other is flushing the ground fire.

16546

Teamwork. In complex fires a number of crews may be working simultaneously in the same close area, each having their own job but all working toward the prime objective of aiding the men who have to be close in while making the shutoff. The chief should get his captains together to discuss strategy and the importance of teamwork. Each captain should know clearly what his job is and what the others are to do. The chief may start the ground-sweep operation first and evaluate its effectiveness. He may then set up the backup and reserve lines and see how they operate. Then he will be ready to give his main attention to the shutoff operation and at the same time keep a close eye on the supporting crews.

Other conditions. The foregoing descriptions relate to ground-level situations where the main objective is to get in to close a valve. They may range from a simple fire where one man makes a shutoff to a large fire where a number of crews work together, as already described. We observed one case where the two close-in nozzle men used 2-1/2-inch jumbo nozzles (about 450 gallons per minute apiece) at a pit fire. The captain had to lie on his stomach over the edge of the pit to reach the valve wheel, and he used a 1-inch fog nozzle (20 gallons per minute) to protect his hand on the valve. Backup lines also were used. Sometimes the valve may be in an elevated position with the ground fire above or below.

Conclusion

Each fire has its own problems and requires good leadership and perfect teamwork. Ignorance of the best technique to use not only is a great risk of life but often means no control of the fire.

The best way to learn the best fire fighting methods is to get good training on large fires on drill grounds. Before working on the complex problems, however, all men should first be trained individually on small fires. Difficult emergency fires are not likely to duplicate training fires, and comprehensive training on various types of large fires is imperative.

16547

19 USING DRY CHEMICAL EXTINGUISHERS

Because the dry chemical extinguisher is the best hand extinguisher for oil or gas fires, learning the proper technique to obtain its greatest effectiveness is especially important. A 20-pound extinguisher will exhaust itself in about 20-25 seconds, and a 30-pound unit, in about 20-30 seconds. In this short a time a fireman cannot correct his errors without serious waste of powder charge. Therefore, he must know the best method before he starts to use the extinguisher.

One of the most difficult problems in training men in the proper use of dry chemical extinguishers is to get them to stand back far enough. This is particularly true with the older firemen, who have had a great deal of experience with CO_2 extinguishers. It is much easier with younger men who are learning from scratch.

Recommended Training Procedure

The step-by-step process is the best training procedure. By learning one point at a time, the fireman retains the knowledge and, in an emergency, does the best job. Suggested steps for the instructor to follow in the training procedure are:

1. Train yourself not to expose your mistakes to the students and lose their confidence.

2. Work with three or four students at a time so they can learn by doing.

3. Select a flat area at least 10 feet wide by 20 feet long and preferably on a day with little or no wind. The area should not be obstructed by equipment.

4. Mark a "foul line" at one end of the area. Step off about 10 feet and place some small object like a spanner wrench or other flat target on the ground, preferably down wind, if there is a breeze.

5. Place the extinguisher at the foul line and draw a line on the ground from the extinguisher to the target. Then explain to the students that,

16548

first, you are going to show them the pattern of the powder when shooting straight at the target.

6. Squat down at the foul line, holding the nozzle steady and horizontal, with the nozzle about 12 inches from the ground, and squeeze the handle to provide one single burst of powder. The white powder will lay a sharp triangular pattern on the ground and properly cover the target.

7. Explain to the students that this is about the correct range to get the greatest effectiveness from a dry chemical hand extinguisher. The 10-foot distance is selected as a fair average. Some makes of extinguishers or nozzle designs may require more or less distance. It is best to obtain this information before the class meets.

8. Pick up the target and place it 5 feet from the foul line. Show the men that, if the target had been 5 feet from the foul line, much of the powder would have overshot the target and would have been lost. If the size of the fire had been close to the capacity of the extinguisher, much of the powder would have been driven right through the flames at ground level, and the fire might not have been extinguished.

9. Move the target back to its original place, 10 feet from the foul line, and tell the students that usually the fire is larger than the small target. Using another target, place it close to the left edge of the powder pattern on the ground and 10 feet from foul line, and relocate the original target at the right side of the pattern. Tell them to assume that the fire is of that breadth. Ask them, "Now what is the best technique to use?"

10. Pick up the extinguisher again and, squatting down again in the same position, discharge the entire extinguisher, but rapidly fan the nozzle so as to widen the angle of the pattern of the deposited powder to cover the targets properly, without significant waste of powder on the side.

11. As the extinguisher starts to lose pressure and range, move in closer and continue the fanning.

12. Go back and discuss the session, driving home the important points:

    - Use the proper distance at the start.
    - Strike the fire at its base or at the bottom of the flame.
    - Fan the nozzle to get full coverage.

16549

Kern County Fire Department

Fig. 55. Note the difference in range of the two extinguishers with no wind.

- Move closer as extinguisher pressure decreases when almost expelled.
- Work down wind where possible.

13. Tell the students how close to the target the fireman should be if he has a CO_2 instead of a dry chemical extinguisher. Using a CO_2 extinguisher, demonstrate the preferred distance and draw a new foul line for a common CO_2 unit. Clearly point out this difference between the two foul lines and the mistake that many firemen make in getting in much too close with a dry chemical extinguisher.

14. Demonstrate with a live fire. Use a 3-foot by 3-foot pan about 2 inches deep. Place the pan in a clear area where there is no powder on the

16550

ground around it. Fill it with water and level the pan. Dump out about half of the water and add gasoline to a level of about 1/2 inch below the rim. (You could start the demonstration at Step 4 with the pan fire first, but experience has shown that the fire distracts the students' interest from the instructor. He should have their full attention in Steps 4-13.)

15. Ignite the gasoline and, from the 10-foot foul line, extinguish the fire, using the fast fanning motion with the nozzle.

16. Move the extinguisher up to the CO_2 foul line, relight the fire, and repeat the process. Show the students how much powder was wasted by shooting beyond the pan. You may not extinguish the fire at close range.

17. Relight the fire and move in with the nozzle to only about 18-24 inches from the fire. By impinging the powder blast onto the gasoline surface, some of the burning gasoline can be knocked out of the pan onto the ground.

18. Back off to the 10-foot line and make a fast kill. Discuss the error of the very close approach. (Now the students are ready to learn by doing. It is assumed here that the students learned the basic design and operating features of the extinguisher when you opened, emptied, and refilled the extinguisher while talking to them.)

19. Explain to the students that not everyone can kill a training fire on the first attempt. Tell them not to be embarrassed, especially if they follow instructions. Select the most likely candidate, mark off a new foul line, step off 10 feet, put down the target, and have him shoot it with one short blast as you did. Discuss the job and then move over to the pan. Repeat to him the points covered in Step 12, while another student lights the fire. If the subject fails to extinguish the pan fire, you, and not one of the other students, should tell him what was wrong. Have him repeat the attempt until he makes a clean "kill."

20. Repeat with the other students.

21. Ask each student to explain to you each of the key points in Item 12.

Other Training Props

Also see Drills 2 and 3 of Section 2 of Part III for other types of props that are suitable for dry chemical training. Figure 90 illustrates one in action.

16551

20 USING WATER FOG WITH DRY CHEMICAL EXTINGUISHERS

For any given size of dry chemical extinguisher, there can be a fire that is slightly too large or too complex to be extinguished by it. This can be serious if the fire must be extinguished promptly and there is only one extinguisher available at the moment. On the other hand, flame size can be reduced considerably by water fog, but fog alone may not extinguish a gas, LP gas, or gasoline fire, for example. Using a combination of water for reducing the size of the flame and dry chemical powder to put it out will extinguish a much larger fire than using one extinguisher without the fog.

Long Beach Fire Department

Fig. 56. A 1947 photo showing a refinery instructor demonstrating the stand-back technique using the early model of dry chemical extinguisher available at that time.

Fire-Extinguishing Elements

How dry chemical works. The active ingredient in the dry chemical extinguisher is sodium bicarbonate--common baking soda. When carbonate is decomposed by flame, carbon dioxide gas is produced. Some people have reasoned erroneously that it is the CO_2 that extinguishes the fire, but not enough CO_2 is produced to do the job alone. Besides, some other powders that do not produce CO_2 can extinguish a fire. The extinguishment actually is accomplished by the powder's entering into and inhibiting the complex chemical reaction of burning. Recently available extinguishers using potassium bicarbonate are about 50 percent more effective than sodium bicarbonate in extinguishing fires.[1]

How water fog works. The small droplets in water fog are evaporated by the

[1] NFPA Quarterly (April, 1960), p. 334. This is a highly technical article on the subject of how a dry chemical functions.

16552

Long Beach Fire Department

Fig. 57. At a 6- x 60-foot trench at a refinery drill ground in 1947, an instructor is using a dry chemical extinguisher in combination with a 1-inch fog nozzle. The man with the fog nozzle is on the opposite side of the trench, hidden by the cloud of steam and powder. It would be difficult to extinguish this fire with one nozzle alone, but it is done readily when a hand extinguisher is also used with the proper technique.

flame. This requires considerable heat absorption and hence reduces the size of the flame.

Combining Fog and Dry Chemicals

History and development. In the early 1940's, when dry chemical extinguishers first were used in quantity by oil refineries in California, they were found to be far more effective than old CO_2 and 2-1/2-gallon foam extinguishers. Yet sometimes fires that had been fully extinguished with a dry chemical extinguisher reignited some seconds afterward, either because the vapor itself was so hot that it reflashed or because it was reignited by the heat from metal surfaces or glowing embers. Such experiences indicated the need for quenching the fire area with water before using the dry chemical extinguisher.

Some people argued that water fog would dissolve the bicarbonate too quickly, but fire tests on the drill grounds showed that the combination of the two is unusually effective. Fast-acting 1-inch or 1-1/2-inch hose for water fog has

16553

Fig. 58. Using hand extinguishers with water fog is not a new technique. This 1945 photo shows a 30-pound CO_2 extinguisher and fog applicator being used on a gasoline spill fire in a crushed rock surface of a refinery drill ground.

16553

Fig. 60. Refinery employees practicing the combination technique in a long pipe trench. Some extinguishers have nozzles with less range than others, and range governs the distance from the target.

been installed in operating areas for prior quenching, and during the second or two that the dry chemical powder is projected through the fog it does not dissolve. This is because, when the powder is milled in manufacture, it is coated with a skin of water repellent that keeps it fluffy and reduces caking in storage. (This short-term waterproofing can be demonstrated by stirring a teaspoon of the powder in a glass of water.) The combination technique has proved very successful in emergency fires.

Preferred combination technique. Oil and gas fires vary considerably in type, character, and size, and no one technique is applicable to all conditions. One preferred method, if a spill or ground fire is within the capacity of the extinguisher or extinguishers on hand, is:

1. Sizing up the job. The experienced captain will size up the job in a moment or two in order not to overlook any condition that might spoil the chances of a kill on the first trial. Factors to consider are:

   - Layout--Is it a simple flat area with no holes, baffles, or interfering equipment? Can the approach be made from any one of a number of sides? (If so, you are lucky!)

   - Extinguishers--Is one extinguisher enough, or should you wait until more are brought up? If two or more extinguishers are needed, should you use them simultaneously or hold them in reserve until the first extinguisher is nearly expelled?

1653

- Quenching--How much water quenching is needed prior to using the dry chemical?

- Firemen--Where will you spot your men for best teamwork?

2. First quenching. If the fire is on a clean, hard surface like concrete with no evident Class A or other materials that may cause reignition, quenching may not be needed.

3. Extinguishment. In the case of a simple ground or flat surface fire, it is best to select a beachhead and plan the movement across the fire area. Dry chemical extinguishers have a good range, up to 15 feet or more; and by fanning the nozzle, a considerable breadth of area may be covered by one extinguisher. First, the fog stream should be directed in the beachhead to reduce the flame size, and then the dry chemical should be applied directly under the fog pattern, as illustrated in Fig. 61.

If one fog nozzle and one extinguisher are available, the fog may be fanned back and forth, and the dry chemical extinguisher may be fanned under it. If two nozzles are available, they may be operated side by side, and one or more extinguishers may be used together. Good teamwork is essential, and this can be learned best by training on drill grounds.

When the beachhead is gained, the nozzle man will move out over the fire surface with the extinguisher blast being maintained, as shown in Fig. 61. As one extinguisher is expelled, another should be started without a lapse of time. If the ground fire is complicated by equipment such as pump bases, large piping, small pits, or trenches, more sizing-up is needed. For example, it may be impossible to extinguish some simple fires with a dozen extinguishers used one at a time, although the same fire may be easily extinguished with two extinguishers used together.[2]

High Fires

High fires can present difficult problems. Those that are within the range of a fog nozzle and dry chemical extinguisher often can be extinguished best if the flame size is reduced with water, and the dry chemical is shot directly through the fog stream at the bottom of the flame. Such fires require skilled

---

[2] A simple prop for learning this technique is described in Part III, Section 2, Drill 3C, and is shown in Fig. 90. It is excellent for training firemen in the need for sizing-up the job and for correcting the overconfident grandstander. A primary drilling prop is described in Drill 2.

16555

Fig. 61. Side view (left) and end view (right).

sizing-up, particularly where more than one nozzle and extinguisher must be used simultaneously.

Supplemental Lines

Sometimes it may be necessary to use straight streams to sweep the ground under the fog nozzle and extinguisher operators where they must work in close to the fire. In all such cases it is necessary to extinguish the ground fire first and quickly work up to the elevated fire.

16556

21 FLASH POINTS OF OILS

Comparative Flash Points

In an earlier paper there is a good description os what is meant by "flash point." This term is used frequently in discussions of the relative hazards of different oils and also the relative ease of extinguishment. A few approximate comparisons are shown in Table 10.

TABLE 10
Comparative Flash Points

Fuel	Flash Point	Characteristics
LP gas and gasoline	Below 0 F	Easy to ignite and difficult to extinguish
Cleaning solvent	About 111 F	Not easy to ignite and not easy to extinguish
Heavy fuel oil	About 170 F	Difficult to ignite and usually easy to extinguish
Lubrication oil	About 450 F	Very difficult to ignite and usually very easy to extinguish

Flash Point Tests

Some firemen have said that the term "flash point" would mean more to them if they knew how the flash point test was made. Then they would have a better understanding of why an open pool of burning diesel oil--say, 10 feet in diameter--can be extinguished with water fog but why the same-size pool of burning gasoline cannot be extinguished with the same fog nozzle and water rate.

Briefly, a flash point test is made by slowly heating a small sample of oil and watching its temperature rise, as indicated by a thermometer. From time to time the atmosphere over the oil is checked by means of a small test flame. When the oil is hot enough, it releases vapor, which is ignited by the test flame. The lowest oil temperature at which the vapor ignites is called the oil's "flash point." Because this is a precise measurement, one of three types of apparatus

16557

is used, depending upon the approximate flash point of the oil being tested. One common type, the closed cup Tagliabue or "tag" tester, is shown in Fig. 62. The other two types of apparatus are similar in principle, and their differences are described later.

Fig. 62

The operation of the tag-closed tester is as follows:

1. The inspector fills the outer container or water bath with cold tap water to a specified level.

2. He places a specified amount of the oil (50 cubic centimeters or about 2 liquid ounces) to be tested in the cup, or inner container, sets it in the outer container (like a double boiler), and places the lid over the oil cup. Finally he checks to see that the small trap door in the lid is closed.

3. On the top of the lid there is a small gas burner that normally stands in a tilted position. The inspector lights the burner and adjusts it to get a flame that is about an eighth of an inch long.

4. Under the water bath is either an electric heating element or a gas burner. He lights this and adjusts it to a low flame.

5. Either from prior tests or general knowledge, the skilled inspector knows the approximate flash point of the oil. When the oil temperature reads about 10° F less than the expected flash point of the oil, he adjusts the heating element under the water bath so as to increase the heat of the oil sample at a uniform rate of about 2° F per minute.

16558

6. At the same time he rotates a knurled wheel on the lid. This simultaneously opens the trap door and turns the test flame down into the opening and thereby checks the atmosphere in the cup momentarily for vapor. Then he closes the door promptly.

7. Then at each 1° F rise in oil temperature, he continues checking until the vapor at the trap door reaches its lower flammable limit and ignites (or "flashes"), and he reads the oil temperature. The flash point is the lowest oil temperature at which the test flame causes ignition.

Since this is a precision test, there are other refinements in the standard testing procedure; but for the sake of brevity, they are not included in the above description. The illustrated apparatus is used for testing samples of certain oils having flash points ranging between room temperature and about 175° F. For samples of certain other oils with flash points ranging between room temperature and about 230° F, a slightly different apparatus, the Pensky-Martens closed-cup tester is used. Some asphalts with flash points to 500° F may be tested; of course, a liquid with a high boiling point is used instead of water for the bath. In principle, the apparatus is the same as that illustrated except that in the oil cup there is a stirring device, which rotates continuously except for the moment that the trap door opens. For samples of very heavy oil, such as lubricating oil, road oil, etc., with flash points above about 160° F, the Cleveland open-top cup is used.

Practical Applications

For the purpose of fire prevention training, the flash test indicates how easily an oil may be ignited intentionally or accidentally. Kerosene, with a flash point of about 130° F, cannot be ignited by passing a lighted match over its surface. If the flame is held very close to the cold oil surface for a short time, however, the surface will heat to above 130° F and the vapor will ignite.

Cleaning solvent, with a flash point of about 110° F, behaves the same as kerosene, but a match ignites it more easily than kerosene because its flash point is lower. In a closed room, thin layers of cold cleaner's solvent evaporates in time and produces a hazardous atmosphere, but obviously, it is not so hazardous as gasoline, which has a flash point below zero. Because its flash point is so low, it is not practical or useful to test gasoline for flash point.

The volatilities of different gasolines are measured by a vapor pressure test in standard apparatus. Cold fuel oil is practically impossible to ignite with a match because its flash point is usually about 160° F.

The foregoing examples of flash points are approximate. Typical ranges of flash points for common fuel are listed in the first paper of this publication.

16559

Fire Extinguishment

Let us consider again the three oils--kerosene, cleaner's solvent, and fuel oil--with approximate flash points of 130°, 110°, and 160° F respectively. Assume, for test purposes, that there is a shallow pan 6 feet in diameter, and a 1-inch fog applicator.

First, the pan contains burning kerosene. The radiant heat from flames heats the surface of the kerosene and starts to produce vapor. When the water fog is applied, the evaporation of the water droplets first extracts heat from the flames and greatly reduces the size of the flame. Additional water cools the hot oil surface to below its flash point of 130° F; vapor release discontinues, and the fire goes out.

The same process takes place when a cleaning solvent fire is quenched in the test pan but it takes longer and is more difficult to extinguish because of its lower flash point. The fire of fuel oil with a flash point of 160° F is noticeably easier to extinguish than the kerosene fire.

This simple principle was demonstrated at the two Bakersfield Oil Fire Control Schools, using 5-gallon open buckets containing fuels ranging from gasoline to heavy fuel oil. These demonstrations clearly showed that, from a practical standpoint, "the higher the flash point, the more difficult it is to ignite the fuel and the easier it is to extinguish the fire."

Let us assume that gasoline is burning in the test pan. Water fog reduces the flame size, but the 70° F water cannot quench or chill the gasoline surface down to its flash point, which is much below 0° F, and therefore cannot extinguish the pan fire. Water fog can kill a gasoline fire only when the container has very high side walls--like a narrow, deep tank--so that the steam formed by the evaporation of the water remains over the burning gasoline and smothers the fire.

Conclusions

1. In order to burn, oil must be in the form of vapor.

2. To release enough vapor to ignite, the surface of the oil must be heated to its flash point.

3. When the oil surface is cooled to below its flash point, vapor release will discontinue sufficiently for the fire to go out.

PART 3 PRACTICAL TRAINING TECHNIQUES

16562

SECTION 1 DEMONSTRATION DRILLS

Fig. 65. Crowd at the 1955 Oil Fire Control School watching relative times for extinguishing fires from different fuels using various methods and extinguishing methods.

Demonstration Drills at the 1955 School

At the 1955 Bakersfield Oil Fire Control School, oil industry instructors presented a half-day of demonstrations. The instructors were assisted by one man who explained the work over a public address system. He announced that the demonstrations showed many of the principles that had been covered in the classroom and that the demonstrations were prerequisite to the participation training that was to follow. The work consisted of:

1. Boilover Characteristics of Crude Oil. Many firemen had never seen a boilover of a crude oil tank during a fire. Few ever have to contend

16563

STOP BLOCK W. S. 19.

MORTISE W.S. 20.

OFFSET W.S.21

L BLOCK W.S. 22

ILLUSTRATION SHEET 12

1054

with such fires, except in oil field areas. The demonstration was made, however, to show a true boilover. This test was started first because it required almost half a day to complete, and from time to time the announcer called attention to the progress of the burning.

Crude oil is raw petroleum from the oil wells, before it is refined. About 1 quart of water was put in the drum, and the oil was ignited. It burned quietly, for about two hours, while the other demonstrations were conducted. During this period the volatile fractions burned out, leaving a hot residuum overlying the cooler unburned oil. When practically all of the lighter components had burned off, the hot residuum contacted the water in the bottom of the drum, flashed the water into steam, and frothed over the rim of the drum, much like a hot tar pot boils over when water is poured into the tar.

2. Ignition and Extinguishing Characteristics of Various Fuels. Drums, cut off to one-third depths, were filled with gasoline, JP-4 fuel, kerosene, stove oil, and fuel oil. Only the gasoline and JP-4 were easy to ignite, and only the gasoline and JP-4 could not be extinguished with a spray nozzle on a garden hose. The flash point relationship was discussed. All fuels were extinguished with both a CO_2 extinguisher and a 2-1/2-gallon foam unit, which were commonly used by some of the fire units at that time. Much of the oil industry and some fire departments had converted to dry chemical extinguishers and fog long before 1955.

3. Burning Rates of Various Fuels. Other one-third drums of various oil fuels were permitted to burn out, and the liquid levels in the drums were shown by a stripe of heat-indicator paint on the outside surface of each drum. The more volatile the oil, the faster it burned off. The paint on the crude oil drum showed the slow downward progress of the heat-wave layer prior to its boilover.

4. Development of Vapor Pressure in Closed Containers. Three 1-gallon paint cans were used. One contained water and the other two contained gasoline. A hole was punched in the lid of one of the gasoline cans to serve as a vent. All three cans were placed over a fire. The closed water and gasoline cans soon blew off their lids. The vented gasoline can burned at the vent as the gasoline boiled away.

5. Characteristics of LP Gas. Vapor drift and ignition by wood flares were demonstrated. This was similar to Drills 12A and 12B, pages 193 and 194. In addition, a domestic LP gas bottle was used to show release of fuel as liquid and as vapor and also the use of the regulator.

After the characteristics of petroleum products were illustrated, principles of control and extinguishment of small fires were demonstrated:

16564

Kern County Fire Department

Fig. 66. An unvented 1-gal. paint can makes a spectacular demonstration. The adequately vented can burned quietly at its vent.

6. Three Smothering Methods of Extinguishment. Three one-third drums of gasoline were used. One was extinguished by placing a cover on the open top of the drum and one was extinguished with chemical foam. The third container was smothered with steam generated from a fog applicator. The high side walls retained the steam blanket.

7. Extinguishing Heavy Oil by Frothing. A one-half drum of burning viscous oil was extinguished by frothing, using a gentle, small spray of water from a garden hose.

8. Extinguishing by Shutting Off Source of Fuel. Two methods were used as described in Drills 1, 2, and 6, pages 164 and 165.

9. Controlling Vapor Release by Cooling. This was a demonstration of the method described in detail in Drill 9, page 187.

16565

Fig. 68. Two industry instructors demonstrating a two-man bottom valve shutoff using one 1-inch fog line. Larger fires would call for two 1-inch lines; and still larger fires, for one or two 1½-inch lines.

Kern County Fire Department

16566

10. Inability to Extinguish a Gasoline Fire. A 3-foot by 3-foot shallow pan of gasoline could not be extinguished with water fog because of its low flash point. It was smothered with a foam blanket from a hand extinguisher. After the demonstrations on small fires, the extinguishment of larger fires was shown by the following props.

11. Directional and Volumetric Fog. Fog patterns from the navy type and Mystery Elkhart type of high velocity directional nozzles were compared with the low velocity volumetric fog from an applicator. Both used about 125 psi nozzle pressure.

12. Use of Directional Nozzles. A Christmas tree valve was shut off under the protection of two fog nozzles using the technique shown in Drill 6 of Part 2 of Chapter III but with a much larger fire than used in Demonstration 8 above.

13. Use of Volumetric Nozzle. Diesel oil (primed with gasoline) was burned in a 15-foot-diameter by 4-foot-deep tank, and the proper use of an applicator was demonstrated.

14. Extinguishing with Foam. The same tank fire was extinguished with a small chemical foam generator and "2-1" chemical foam powder. This has a commercial mixture of sodium bicarbonate, aluminum sulphate, and foaming agent.

15. Extinguishing with Foam. The same 15-foot by 4-foot tank, burning diesel oil, was extinguished with a small mechanical form generator and 3 percent solution.

16. Three-Step Process of Training. The step-by-step technique often is used by oil industry instructors in training procedures where fire is a distraction. It is particularly applicable to teamwork training on complex fires. This highly recommended method of training was demonstrated by means of an outlet valve fire at a simulated tank truck.

    Step 1. A student group was trained as to proper approach, stance, etc. The fuel valve was closed, and there was no fire and no water at the nozzles. The prop is illustrated, without fire, by Fig. 69.

    Step 2. The men repeated Step 1, but with fog to show fog patterns and their use. Emphasis on proper procedure was gained without a fire to distract them.

    Step 3. The valve was opened, the fuel ignited, and the men, applying the lessons learned in Steps 1 and 2, approached and shut off the bottom valve.

16567

Kern County Fire Department

Fig. 69. This is a particularly good prop for three-step training. The inside valve can be opened to produce a relatively small fire for beginners and the shutoff can be made with the outside valve. Then the regulating valve can be opened more to produce a larger fire for the men who have gained some skill.

Fig. 70. A view of the first demonstration at a Bakersfield school as seen from the grandstand. The announcer with the PA system on the platform describes each step of the demonstrations.

16568

At the end of the half-day demonstration session, a number of the fire service instructors extinguished some of the fires just demonstrated to be ready for their participation training the next day.

Demonstration Drills at the 1961 School

In the 1961 Bakersfield Oil Fire Control School demonstrations also were run for a half-day in a similar manner. Although many of the demonstrations repeated those used in 1955, some new ones were used, and some were modified as described below:

1. Ignition and Extinguishing Characteristics of Various Petroleum Fuels. Six different oils were put in labeled 5-gallon buckets. They were gasoline, JP-4 jet fuel, Turbine Fuel A, cleaning solvent, diesel oil, and heavy fuel. In order to round out the family, a 5-gallon cylinder of butane was added. The containers were lined up in the order of flash points, with the butane on one end and heavy fuel at the other. A torch was used to show that high flash fuel oil ignited with difficulty and ignition was easier for oils with progressively lower flash points. It was necessary to prime the fuel and diesel with a little gasoline in order to ignite it.

   Each of the bucket fires was snuffed out by sliding a lid over the buckets. Then they were reignited, and extinguishment was attempted with water fog. JP-4, gasoline, and butane could not be cooled below their flash points and consequently were not extinguished.

2. Extinguishment by Frothing. A large pit with heavy high flash point crude oil could not be ignited until it was primed with a little gasoline. The operator demonstrated how to froth out the fire using a 1-inch coarse spray nozzle (see Fig. 63 and 64).

3. Rate of Burning. This demonstration illustrated the rate of burning as discussed in the fifth paper in Part I. A hand pump in a barrel of gasoline pumped the fuel at a low rate into the high end of a shallow, sloping, 2-foot by 20-foot trench. At the low flow rate the gasoline burned in the upper 6 feet of the trench as fast as supplied. At a higher supply rate the burning stream extended to about 15 feet. At a much higher rate it burned on into a pool at the lower end of the trench, a simulated safe area for burning. Then to show fire control in the trench, water fog was used to reduce the flame intensity and quickly flush the burning stream into the pool. Figures 78 and 82 illustrate practical applications of the principles brought out by this demonstration.

4. Controlled flushing. Controlled flushing, which has been used successfully in preventing the spread of some oil fires, is illustrated in Fig. 78

16569

a little water was played on the upper part of the drum and the small vent fire went out, because no more vapor was vented. The demonstration showed, first, that a properly vented gasoline tank will not cause trouble even though exposed to fire and, second, that the venting fire will quickly subside after the ground fire is killed.

11. Making a Delivery. No fire was involved. With an LP gas tank truck and an LP gas tank, the operator slowly went through all of the proper steps of making a delivery, while the man at the public address system described these steps and the reasons for them.

As at the 1955 school, the announcer said that instructors in the fire service would find some or all of these demonstrations easy to conduct at their own oil fire control schools and that the demonstrations would help students to understand the classroom work. He pointed out that, in order for each demonstration to be effective, the instructor should repeat the principle to be demonstrated and clearly tie it in with the classroom discussion. He also pointed out that, when the student understands these principles and is confronted with an emergency oil fire, he should be better prepared to size up the fire fighting problem intelligently and to do an efficient job of control or extinguishment. Too many firemen have been injured, and too many oil and gas fires have caused great damage because of an improper size-up and poor supervision.

16571

SECTION 2 PARTICIPATION DRILLS

Both the 1955 and 1961 fire schools had two drill grounds, which ordinarily are used by two different oil companies to train their own pipeline and production department employees. Prior to the school, the oil industry instructors and officers from the Kern County Fire Department ran dress rehearsals to check out the planned drills. On the day of the drills the group was divided into two main sections; each section completed the work at one drill ground and then moved to the other. The two sections were divided into small groups, each under the supervision of an instructor from the State Fire Training Program.

It is not practical for most fire departments to construct permanent drill grounds of this kind. However, there are many smaller, portable props, which can be used by any fire department. Such props are described in Section 3 of this chapter.

Participation Drills at the 1955 School

Some of the drills used in the 1955 school were repeated in the 1961 school. The following descriptions include the drills used at both schools, as well as those used only at the 1955 school.

1. Tank Truck Overflow. This prop simulated a truck tank overflow at a loading rack. The fill-stem valve was opened and the tank overflowed to produce a typical overflow and spill fire. Using two 1-1/2-inch fog lines for protection, the fill-stem valve was closed and the ground fire burned out under control. (This drill was repeated in 1961 at both drill grounds because of the importance of the techniques used.)

2. Tank Truck Bottom Valve. A 1-inch bottom drain valve on the simulated tank truck was opened, and the spill and ground fires were ignited. Using one 1-1/2-inch and one 1-inch fog nozzle, the students closed the valve. (The same props were used for Drills 1 and 2 at both drill grounds. This drill was not repeated in 1961, when new drills were substituted.)

3. Trench Fire. Burning diesel oil in a trench about 50 feet long by 5 feet wide by 4 feet deep with a 10-foot ell section in one end was extinguished with two 1-inch fog nozzles. (This was not repeated in 1961.)

16572

Kern County Fire Department

Fig. 71. Gasoline overflow fire from a simulated tank truck. The valve on the fill stem that was closed has a slanting handle, which can be seen at the top left edge of the flame. Firemen are starting to get the fire under control prior to closing the valve.

4. A "10 by 10" Pit Fire. A concrete pit, 10 feet by 10 feet, was filled with heavy high flash oil. The oil was kindled with gasoline, ignited, and frothed out, using a 1-inch hose stream. See Fig. 74. (This was not repeated in 1961.)

5. A "15 by 35" Pit Fire. A 15- by 35-foot earth pit was filled with high flash heavy crude oil, which was primed with light oil and ignited. Using a 1-1/2-inch combination fog-straight stream, the firemen extinguished the fire by reducing the surface temperature of the oil below its flash point, assisted by frothing the surface. (This drill was repeated in 1961.)

6. Christmas Tree. This type of prop, with its unusual name, has been used on drill grounds for over 20 years. It consists of a vertical pipe

with side branch outlets, which can be adjusted to produce various patterns and sizes of fires. It has the reputation of separating the men from the boys. (At the 1955 school a tree with gasoline was used at one drill ground, and a larger tree, with light crude oil, was used at the other drill ground. In 1961 only the crude oil tree was used again.)

7. Pump or Flange Leak Fire. At one drill ground an old reciprocating duplex pump was fitted with a leaking packing gland and a leaking flange, from which burning light crude oil was sprayed over the pump and surrounding ground. Using fog from two 1-inch lines, the firemen moved in and closed the valve in the fire area and "starved the fire." (This drill was repeated in 1961.) At the other drill ground, gasoline was pumped to a smaller pump, and one man with one 1-inch line made a similar shutoff. (This was not repeated in 1961.)

8. Simulated Floating Roof Seal Fire. (Floating roof tanks contain a seal space between the outside edge of the roof and the shell of the tank, and

16574

the void is sealed with a special sliding mechanism, which is reasonably vapor tight. On rare occasions the seals have been ignited by lightning, and it is necessary for firemen to extinguish the light oil gutter

Kern County Fire Department

Fig. 74. Frothing out a fire involving high flash oil in a 10- x 10-foot pit with straight stream spray from a 1-inch fog nozzle.

fire with either dry chemical or foam.) A simulated seal space was fabricated from light steel plate, forming a gutter whose approximate dimensions were 1 foot wide by 1 foot deep by 25 feet long. This gutter was partly filled with gasoline. The firemen extinguished the fire with small, portable air or mechanical foam generator equipment. (This drill was not repeated in 1961.)

9. Complex Gasoline Fire. In principle this prop resembled Drill 3C, described on page 180. It illustrated the ability of a 1-inch fog stream to reduce the size of the gasoline fire sufficiently to be extinguished with a 20-pound dry chemical extinguisher; whereas without the fog it would be difficult to extinguish with one chemical extinguisher. The prop consisted of an open-top half drum mounted on a 30-inch-long piece of 6-inch pipe. This prop was easier to handle than a simple open-top drum like the one illustrated for Drill 3C. (This drill was not repeated in 1961.)

Demonstrations at the 1955 School

Four demonstrations also were run at the 1955 school. They were not repeated at the 1961 school because of lack of time.

16575

Kern County Fire Department

Fig. 75. Christmas tree prop during approach with two 1½-inch fog nozzles. Note the low approach and proper tilt of the nozzle.

Fig. 76. Crude oil is flowing from an open bleed valve in a large pump, and the shutoff will be made using one 1½-inch fog line. Various kinds of problems can be set up with a prop of this kind.

16576

1. Tank Truck Dome Fire. The safety features of a tank truck were pointed out, and the vapor at an open dome was ignited showing the lazy, small dome fire that can be extinguished readily with a dry chemical or CO_2 extinguisher, by smothering with a wet blanket, or simply by closing the dome cover, if the fill stem was not in the dome opening.

2. Tank Fire. A tank 9.5 feet high by 24 feet in diameter and containing diesel oil was primed with gasoline and ignited. With a small mechanical foam generator and an overshot, the fire was extinguished.

3. Long Ditch Fire. A shallow sloping ditch about 150 feet long was filled, from the upper end, with light crude oil. The fire was knocked back,

Fig. 77. Simulated seal space for a fire on a floating roof tank.

16577

controlled with water fog, and extinguished with foam. Because of its narrow width, it could have been extinguished readily with dry chemical, but the purpose of the test was to show the use of foam.

4. Spill Fire on Rocks. A gasoline spill fire over crushed rock was used to show the difficulty of extinguishment compared with open ground.

Between 1955 and 1961 the techniques in the use of water fog and dry chemical in the oil industry had improved so much that the use of foam (except on large spill or large tank fires) was almost discontinued. Foam requires special

Fig. 78. Spray from a 1-inch line is adequate to flush a small fire back in a simulated gutter made by overlapping corrugated iron sheets. Large fires are handled with larger lines, and the excess oil is flushed aside to burn out under control.

equipment (often not on hand when needed), time to set up for use, and special training. Since the extinguishment is gained by applying a foam blanket on a flat, quiet surface, foam has limited applications. Hence the foam demonstrations were not repeated at the 1961 school in order to devote more time to other, more important props.

Participation Drills at the 1961 School

Approximately 700 firemen from the several western states attended the 1961 school. They were separated into seven groups and they worked at several props at the two drill grounds. About 20 to 50 drills were run at each prop, depending upon the number of firemen who could participate as a team on each drill. Instructors from both the Kern County Fire Department and oil industry trained the firemen students. In addition to Drills 1, 5, 6, and 7 of the 1955 school, the following drills were given at the 1961 school.

16578

Western Oil and Gas Association

Fig. 81. After the ground fire is flushed away, firemen will direct a straight stream into the open end of the gasoline fuel pipe to drive the fuel back into the line and close the fuel valve.

1. Pipeline Leak and Fire. A 100-gallon elevated gasoline tank had one valve in a drain line near the tank and another valve in the horizontal outlet nipple. The tank was located so that the ground fire under the valve and outlet would not be swept away easily. In principle the prop corresponded to Drill 6, page 165. By directing a straight stream from a 1-inch nozzle into the end of the open nipple, the flow of fuel through the valve was restricted and the valve was approached and shut off.

2. Gutter Fire. A long, sloping, shallow trench was made to simulate a typical gutter, and gasoline was hand-pumped from a drum into the top end of the trench and ignited. With a 1-1/2-inch straight stream, the fuel was backed up the gutter and thrown out to the side to burn out "in the street," and the fire was prevented from spreading on down the trench. Principles on this rate of burning were covered in Demonstration 3 of the 1961 school and described on page 161.

Kern County Fire Department

Fig. 82. Starting to control the gutter fire.

16580

3. LP Gas Release. This prop demonstrated the vapor drift of butane from an open line with ignition for surrounding flare pots. The firemen used a 1-inch nozzle, adjusted to narrow spray, to dissipate the vapor and prevent ignition. This technique is described in the thirteenth paper, pages 90 to 96. One demonstration was given at the 1961 school.

Demonstration at the 1961 School

The tank truck dome fire of the 1955 school was repeated with the addition of an underground tank fire. A small tank was provided with a vent pipe and buried. A few days before, some gasoline had been put in the tank to create the usual rich vapor atmosphere. During the demonstration, while a dump was being made, the vapors at the vent and at the fill opening were ignited to show that the vapor content of the atmosphere being vented was above its upper flammable limit and hence not flammable or explosive within the tank. The flames diminished to a small flicker when the dump was stopped.

Kern County Fire Department

Fig. 83. Dissipating butane vapor release away from flare pots, using a 1-inch spray nozzle.

Comments on Participation Drills

The 1961 Oil Fire Control School was attended by some 700 firemen. The majority of these men were able to do all of the drills by operating most of the props simultaneously at the two drill grounds. One prop at a time is used for employee training during the oil industry's use of these grounds. The employees are divided into small groups and given intensive training on each prop. Many employees, farther from the permanent drill grounds, secure their training by using portable props, such as those described in the following section.

Local fire departments may well follow the example of the oil companies, with the exception of maintaining permanent drill grounds. Only large concentrations

16581

of firemen would justify such an expense. Fire departments too, however, can conduct very efficient training by using smaller portable props and giving close, individual instruction to small groups of men. Such training should not be delayed until fire chiefs can have fixed props constructed. With imagination, ingenuity, and only a little money, they can construct props that serve the purpose very well.

Participation drills are of limited value unless they are preceded by proper classroom and demonstration work, coupled with examinations, to assure adequate preparation for field drills.

16582

SECTION 3 SIMPLE TRAINING PROPS

The oil industry has had long experience in the design and use of fire drill grounds, and many men in the fire service have worked in fire-training areas at refinery, oil field, and pipeline properties where large props have been used.

Portable props also are used for employees and fire-service personnel when large props are not available. These smaller props are very satisfactory for training, because they are inexpensive to make, do not use much fuel, and can be used in limited areas. They are highly recommended. Small props are excellent for retraining the most experienced firemen, for they present problems that even seasoned men find hard to handle with the equipment at hand.

The following props and drills are designed for small classes, for the most effective training is accomplished with six or less men at a time. These drills range from the simplest, for teaching fundamentals to rookies, to the most difficult, for teaching advanced techniques to experienced firemen.[1]

Oil industry instructors, who are specialists with long experience in the handling of oil and LP gas emergency fires, have observed one fundamental: There is a tendency on the part of some of the older fire servicemen to discount the need for training with small, simple props, using small fires. Many of these overconfident firemen do not know how to use the special techniques on oil and

---

[1]Some of the illustrations are included to show the props that were used in many schools; others show control and extinguishing techniques that were tried. Unfortunately, it was impossible to secure pictures from all of the schools, and some of the photographs are not too clear.

Sometime in the future this manual may be reissued or supplemented, and new photographs will be needed. If any of you have any good pictures of props in use at the oil fire control schools before 1940, please send glossy prints to Thomas S. Ward, Supervisor of Fire Training, State Department of Education, 721 Capitol Mall, Sacramento, Calif., 95814. Your accompanying letter should include the date, location, and a brief description of both the prop and the school. Large black and white photographs of good props that have not been illustrated in this manual also are desired. These pictures and descriptive information will be kept on file for future use.

STEP 2.

STEP 3.

STEP 4.

ILLUSTRATION SHEET 14.

1956

Fig. 84. Very few firemen have occasion to fight a large, industrial-type fire of the kind shown by this prop on a refinery drill ground. For earlier sequences on this prop, see Figs. 43 and 50. Students learning new techniques should train first on small props and then graduate to the larger ones. Bad habits can be acquired by starting on big props.

LP gas fires. Often these men expose themselves to unnecessary danger. For example, six firemen died in the Kansas City bulk plant fire of August 18, 1959. In other cases, small fires have rapidly developed into uncontrolled large fires because of the use of wrong fire fighting procedures. Brute strength or awkwardness plus excess water or other extinguishing agent are not the answer. Much valuable training can be gained with the use of the small portable props described in this paper.

In all cases, hand extinguishers and/or small booster lines are used in teaching basic techniques. After the rookie firemen become proficient, they are ready to train with advanced props with larger and more complex fires.

Drill 1

Objective. To show that a fire cannot be extinguished when the fuel is flowing or falling to a lower level, unless it is fought from the bottom up.

Fig. 85

Prop. A 5-gallon bucket with holes punched in the bottom is hung from a sloping piece of scrap pipe. It is suspended about 2 feet over a shallow 3-foot by 3-foot pan or pit, which contains an inch or two inches of water. (Fig. 85.)

This is the primary or "rookie" prop. Experienced firemen have been seen tackling it with indifference and improper technique, requiring excessive time and powder. Then, after attacking the large tub prop of the same

16584

type, they were unable to make the kill with one extinguisher, although well-trained rookies could do the job. In a real emergency such lack of skill could be serious.

Procedure

1. Train yourself on every new prop until you are fully proficient in its use and develop the "chatter" and proper sequence of steps to use with your students. A precise, crisp technique can be developed by an instructor only through practice on untried props. Be self-critical until you have gained enough smoothness and proficiency to start training your men. (It is assumed that you have already instructed your students on the proper distance or range techniques that are described in Paper 19, pages 138 to 141.)

2. Have on hand half a dozen or so charged 20- or 30-pound dry chemical extinguishers, plus extra chemical or cartridges for recharging as needed.

3. Describe the purpose of the prop and the correct technique to use and why. The extinguishers, already located about 10 feet upwind from the prop, will be used promptly to kill first the pan fire, then the falling fire, and finally the fire in the bucket. The residual fire in the bucket may require a closer approach for the final step of extinguishment.

4. Pour a gallon of gasoline into the bucket and be ready to ignite the fire in the pan and bucket after the water in the pan is covered with gasoline.

5. Without wasting fuel, quickly light the fire and attempt to extinguish it from the top down, to illustrate the improper technique.

6. Extinguish the fire by the correct method.

7. Before recharging the bucket with fuel, quench the prop with water fog to avoid reignition from embers and almost certain injury.

8. Select a student. Have him explain what technique he will use and why.

9. Add the fuel, ignite it, and have the student extinguish the fire. If an exceptionally fast extinguishment is achieved, be ready to reignite the fuel and have the student try it again.

10. Have other students go through the same procedure.

For advanced training on the same type of prop, some instructors have used a small tub or larger pan or pit to provide a larger and faster flow of fuel,

16585

using the same basic technique. The bucket is ideal for the rookie, and the larger prop can be designed to tax the capacity of one small extinguisher in the hands of a skilled and experienced fireman. The larger prop is not difficult if handled correctly.

Drill 2

Objective. To show that the fire described in Drill 1 can be extinguished with with greater ease if the flames are reduced in size by use of water fog from a 1-inch hand line and then extinguished with dry chemical shot through the fog. This requires the proper teamwork of two firemen.

Prop. The same as in Drill 1 except that a charged 1-inch hand or booster line is ready for use.

Procedure

1. You and your assistant should gain proper proficiency before performing before students. See the twentieth paper, pages 142 to 147.

2. After describing the purpose of the drill and technique to follow, your assistant should demonstrate, without fire, the proper fog pattern and nozzle procedure, and the reason for using the fog with the dry chemical. This is for the purpose of reducing the size of the fire and also to quench all embers, to prevent reignition after extinguishment.

3. The subsequent training steps should follow in general the procedure in Drill 1, being sure that the students know the fog nozzle handling and the extinguisher handling as well as the teamwork.

Drills 3A, 3B, and 3C

Objectives. There are three objectives for three successive drills covering the three following points:

1. Teaching proper distance for handling dry chemical extinguishers. This is Drill 3A.

2. Teaching extinguishing the bottom fire first and the top fire next. This is Drill 3B.

3. Sizing up a problem. In Drill 3C, it is almost impossible for one man, regardless of his skill and experience, to extinguish this small fire even if he has a dozen hand extinguishers available for immediate use. It is a most excellent drill to eliminate overconfidence in the "show off" fireman.

16586

Prop. The same prop is used for all three drills. An ordinary steel oil drum has its top cut off level all around. With a hairpin-shaped 1-inch pipe (shown in Fig. 82) connected to a garden or booster hose, fill the drum with water to the point of overflow. Then level the drum accurately with shovel and dirt so that a small amount of water overflows the rim of the drum evenly all around when supplied through the 1-inch pipe. (Fig. 86.)

Drill 3A

Objective. To teach the student to stand back the proper distance with a dry chemical extinguisher to gain the most effective use. The prop is a good one to use for refresher training in this technique, as covered in the nineteenth paper, pages 138 to 141.

Fig. 86

Procedure

1. Using a bucket, bail about 10 gallons of water out of the barrel and add gasoline to give about 1/2 inch of free board.

2. Ignite the gasoline and extinguish the fire quickly with one short blast of the extinguisher, standing back the proper distance.

Torrance Fire Department

Fig. 87. Some drums have a bung in the shell near one end. With a bell-reducer a prop can be readily assembled without using a welder. With minor changes in piping, the one prop may serve for Drills 3-9. Here the drum is being leveled for use on Drills 3C and 5.

16587

3. Move up to within 18 inches of the drum, reignite the fuel, and direct the power charge directly into the burning gasoline, showing how the blast from the extinguisher can throw burning fuel out of the drum. Then step back to the proper distance and extinguish the fire.

4. If a CO_2 extinguisher is handy, demonstrate how a much closer range is needed to gain fast extinguishment.

5. Have one student after another extinguish the fire, using a shorter range only as the extinguisher pressure noticeably decreases.

Drill 3B

Objective. To teach the student to kill the bottom fire first. This is a good follow-up for Drill 1, because it is a much more complex fire.

Prop. Using a shovel, build a 6- to 8-inch compact, circular dike of earth, about 18 inches out from the drum. With fog, wet down the inside of the dike and add about 1/2 inch of water, so that gasoline will not be absorbed in the soil. Add fuel to the drum to offset that burned off in Drill 3A. Pour about 1-2 inches of gasoline around the drum within the dike.

Procedure

1. Explain the purpose of the drill, re-emphasizing the necessity of extinguishing the bottom fire first.

2. Ignite the bottom and top fire and demonstrate the proper technique. This can be a difficult fire for one man to extinguish because the flame tends to burn around on the opposite side of the drum from where the fireman is. With fast footwork and skilled handling, you can extinguish it. Firemen who are overconfident can learn good techniques from the simple fire.

3. With rookies, you may find it advisable not to use a full charge of fuel within the dike.

Drill 3C

Objective. After Drill 3B, 3C is most important. An emergency can occur that one fireman cannot handle by himself, and it is a waste of critical time and extinguisher charge to attempt it alone. The fireman should be able to size up the fire, note its complexity, realize that he cannot extinguish it without help, and immediately get assistance. This drill also teaches the two-man--two-extinguisher technique and killing a single fire coupled with the bottom-up technique. It is an excellent drill to teach men to maintain their proper distance, work from the bottom up, and use teamwork.

Prop. Sufficient water is bailed out of the drum to permit charging with about 10 gallons of gasoline fuel. The water inlet of the 1-inch hairpin pipe is placed over the rim of the drum and connected to a garden hose or booster hose line. A charge of about 1 inch of gasoline is poured on the water within the diked enclosure around the drum. This prop was used in Demonstration 8 in the 1961 Bakersfield Oil Fire Control School and has been used many times in smaller fire schools.

The equipment shown in Fig. 86, page 179, is commonly used for Drills 3A, B, and C because no welding is needed to assemble it. Sometimes a drum can be found that has a side bung near one end, and with proper piping it can be made sufficiently versatile to use for these drills; or a drum with a welded-in collar may be used.

The diameter of the dike shown in Figs. 87, 89, and 90 is larger than noted in Fig. 86 in order to use larger ground fires for advanced students.

Fig. 88. A plan view of the layout used in Drill 3C.

Fig. 89. This sketch illustrates the layout of the prop for Drill 3C.

16589

Procedure

1. Use two assistants in this drill. Explain the two purposes of the drill, namely: (1) to learn important size-up and (2) to learn the teamwork of using two extinguishers simultaneously.

2. Have one assistant regulate a slow flow of water into the drum to provide a slow, uniform overflow of gasoline all around the rim of the drum into the diked area below.

3. Considering wind direction, place two pressurized extinguishers at the proper distance from the drum opposite one another on each side of the drum.

4. Have the two assistants position themselves correctly; the "water control" man first lights the top and bottom fires, quickly moves to his water control valve, and starts overflowing the drum at the desired rate.

5. When you give the signal, both extinguishers are used to make the kill.

6. You can prearrange an impressive supplement, which always is beneficial for the students. Secure the aid of an experienced fireman who "just happens to be on hand" at the start of Drill 3C. After Step 5, above, the old hand contends that he can extinguish the fire alone with two extinguishers, one used after the other. After a short argument, a $1 bet is arranged, and one of the students holds the money.

   Of course, you win the bet, particularly if the water control assistant provides a proper uniform overflow fire down the sides of the drum. After the fireman's failure, help him to kill the fire, using proper teamwork and correct technique. This supplemental demonstration never fails to provide a good show and teaches the proper size-up lesson. The students then realize that this is a "put-up job" for their benefit.

7. The training of the students in teams of two men should follow. All failures should be followed up with precise instruction. In the excitement it is possible for two students to move in too close to the drums and waste powder, particularly when the powder cloud reduces visibility. There have been cases in which one student got in too close, blasted gasoline out of the drum, and burned the hands of the other student.

Drill 4

Objective. This demonstrates the same principles as Drill 2, except that the prop for 3C is used to achieve added teamwork involving the use of a fog nozzle on a booster line.

Torrance Fire Department

Fig. 90. This prop is now being used for an overflow fire. Water is being supplied to the drum through the bottom pipe and hose to spill over the gasoline. The fire is quickly extinguished with the simultaneous attack from the two sides of the drum. Note that the men are standing on the dike, which is over 10 feet from the drum.

16591

Prop. Use 3B or 3C, plus one or two hose lines.

Procedure. Work this out before the class meets, using the combination techniques of Drills 2 and 3B and 2 and 3C.

Discussion. It is not necessary to use large, expensive props and a lot of fuel, like the Bakersfield Oil Fire Control Schools, in order to do a good fire-training job. The simple inexpensive props, like those described for Drills 1, 2, and 3, are most excellent for teaching proper techniques. They are portable, require only a small training area, and use very little fuel.

Torrance Fire Department

Fig. 91. The rookie is closing off the valve, and the fireman with the 1-inch fog nozzle is barely visible. The main fire was burning in a pit directly under the valve until water fog reduced it.

By using ingenuity you can vary the props somewhat. For example, in Drill 3, using a drum of gasoline and a barrel pump connected to the pump line, you can supply gasoline directly to the open-top drum. With a slight variation, as shown in Drill 5, the gasoline fuel can be supplied to the bottom of the drum, and this bottom connection also can be used to drain water as well as teach other principles covered in Drill 6.

Drill 5

Objective. To train a man to extinguish a fire by "starving" the fire, as described in the first paper of Part I and Part II, and by using the one-man approach covered in Paper 18 of Part II.

Prop. Use an open-top drum, as illustrated for Drills 3 and 4. Weld a 3/4-inch or 1-inch coupling into the shell of the drum near the bottom. Build a dike, as described for Drill 3B. Place the drum securely on bricks about

16592

4-6 inches off the ground in the center of the circular dike. Level the top of the drum with a spirit level. Fit a steel gate valve into the coupling with a 3-inch nipple. Provide a short nipple and tee at the outlet of the valve and plug the tee.

If this prop is also to be used for Drill 3, fill the drum with water through the bottom outlet instead of using the removable hairpin pipe and level the drum accurately as done for Drill 3. Then empty the drum by removing the plug in the tee. Make a cut in the dike on the side of the drum opposite the valve and spade a ditch away from the dike to dispose of the water from draining the drum and also from the fog nozzles to be used later in Drill 5.

Then add enough gasoline to the drum. It may be bucketed in. If this prop has been used in Drill 3, the tee may be connected to a 20-foot length of pipe connected to an outlet hose from a barrel pump. The fuel may be supplied from a drum of gasoline located a safe distance from this prop and the drum charged for Drill 5 with the barrel pump. After the charge is completed, close the valve and remove the plug from the bull of the tee.

Procedure

1. Explain the purpose of the drill to your students. The valve will be opened, the fuel from the open tee drained into the dike; and after the flow is established, the fuel will be ignited.

2. Demonstrate to the students the proper technique for making a one-man shutoff, as illustrated in Fig. 33.

3. Follow through with the students. Make the shutoff soon after the valve is open so as not to waste the fuel and not to heat the drum excessively. The vapor in the drum may ignite after a number of students have been trained, but this fire may be allowed to burn. It will not interfere with training at the valve, particularly if the liquid level is low in the drum.

Drill 6

Objective. In principle this is the same as Participation Drill 5, given at the 1961 Bakersfield School and described on page 165 and in Fig. 77.

Prop. Use the same prop as for Drill 5. Remove the tee and connecting short nipple into the valve and in its place screw in 12-inch-long pipe nipple. Provide a wooden plug to fit into the outlet end of the nipple.

Procedure. Explain the purpose of the drill. Sometimes there is a leak in a pipeline or shell of a container where it is impossible to move in and make

Assignment

WS. 15. Step: Refer to Illustration Sheets 11, 12, 13, and 14 pages 45, 47, 49, and 51 for this unit of work. You will make a freehand sketch on full-size practice paper of the front view and the right end view of the step. First, draw a border around the paper about ½ inch in from the edges. In the lower right hand corner below the border draw two light guide lines and letter-in your name and hour. Block in your views by using light construction lines as shown on Illustration Sheet 14, page 51. Save it for handing in and grading when you have completed WS 15, WS 16, WS 17, and WS 18.

WS. 16. Enclosed Step: You will make a two-view freehand sketch of the Enclosed Step showing top and front views. Follow the directions given for WS 15. Have your drawing checked. Save it for handing in and grading when you have completed WS 15, WS 16, WS 17, and WS 18.

WS. 17. H Block: Make a three-view freehand sketch of the H Block. Show top, front, and right end views. Follow the directions given for WS 15. Have your drawing checked. Save it for grading later.

WS. 18. Groove: Make a three-view freehand sketch of the groove. Show top, front, and right end views. Follow the directions given for WS 15. Have your drawing checked. Now staple Work Sheets 15, 16, 17, and 18 together in the upper left-hand corner and turn them in for grading. One grade will be given for the four sketches.

repairs with the fire under way. By directing a straight water stream into the hole, the outflow of the fuel can be greatly reduced or stopped while the ground fire is swept away with another hose stream and the hole is plugged with a wooden plug. As in the case with all props, it is necessary to practice to gain proficiency before training the students. The method has been used to handle emergencies in the industry.

This drill requires two students, each with a 1-inch hose line. First one student should squat down about 8 or 10 feet from the open end of the 1-inch pipe and practice hitting the open end of the 12-inch nipple with his straight stream. He should shut off his stream while the fuel valve is partially opened and the fuel falling from the 12-inch nipple ignited. The other student, with wooden plug in pocket, has the other 1-inch hose line.

On signal the student should direct his straight stream into the pipe to stop the flow while the other student sweeps away the residual ground fire and then, with his nozzle on fog to protect himself from any small reflash, puts the wooden plug in the hole to stop the flow.

The valve is not a part of this drill, but the valve should be closed between each drill.

This drill can be made more realistic by altering the dike around the drum so that the fuel flows down a shallow ditch to a burning basin located 10 feet or more from the drum. Then when the fuel is replaced with water, it flushes the burning fuel away from the hole into the basin.

Drill 7

Objective. To illustrate another way to starve a fire from a leaking pipeline by replacing the leaking fuel with water. This drill was used as Demonstration 7 at the 1961 Bakersfield School. The technique has been used many times in the industry to handle emergencies.

Prop. Following Drill 6, replace the 12-inch nipple with the tee and short nipple as shown in the sketch for Drill 5. Remove the plug from end of the tee and screw in a 10-foot (or so) length of pipe in place of the plug. Attach a 1-inch or garden hose to the open end of the long pipe.

Procedure. Explain the application of this technique to the students. Open the valve, start the fuel flow in the ditch and burning basin, ignite the fuel, and start the water flow. Point out that the fuel leak is now replaced by a water leak. Extinguish the residual fire with a dry chemical, flush it into a nearby safe burning basin or let it burn out under control with water fog.

Drill 8

Objective. This demonstration is similar to Drill 7, except that it illustrates a method of stopping a fuel leak in the bottom of a tank, vessel, or container. It has been used when tank trucks have turned upside down in an accident and gasoline is leaking from sprung dome covers.

Prop. Refit the drum assembly, as in Drill 5, and use the tank and burning basin, instead of the dike around the drum. Have on hand the hairpin pipe turn, connected to the water hose as shown in the sketch for Drill 3, but not placed in the drum.

Procedure. Explain the purpose of the drill. Open the fuel valve and ignite the fuel in the ditch and burning basin. Under fog protection insert the hairpin turn (see sketch for Drill 3) and start the water flow at full rate. As soon as the water level in the drum has covered the oil outlet, the oil leak will be replaced by a water leak. Lower the water rate to avoid overfilling the drum but still prevent gasoline from coming from the leak at the tee. Handle the residual fire as in the case of Drill 7.

Drill 9

Objective. To demonstrate the small amount of water needed adequately to cool a fire-exposed container of gasoline.

Prop. Place upright a full drum of motor fuel gasoline in a diked enclosure similar to that used in Drill 3B, but use at least an 8-inch dike. Remove the plug from the 3/4-inch (or larger) bung and insert in its place an 8-12-inch-length standard nipple of the same pipe size as the bung opening. Add water to the dike, letting it saturate the soil to avoid loss of fuel by absorption into the ground. Use a garden hose with a domestic spray nozzle for the fire control.

If the prop is used for successive training sessions or demonstrations, take care to keep the fuel replenished in the drum, and maintain a high liquid level. If, through successive uses, the light fractions are boiled off and the drum is cooled, the shrinkage of the atmosphere may draw in enough air to produce a flammable vapor-air mixture in the drum and be dangerous when used again.

Usually this prop is used only for one or two demonstrations, since it takes too long to heat up and cool down for a number of students. However, if used successively, the above safety precaution must be followed to avoid explosion.

Procedure.

1. In preparing for this demonstration, read Paper 5, pages 39 to 50. Explain to the students the purpose of the demonstration. In the case of a

Fig. 92

tank fire or a gasoline truck fire, a small amount of water, properly applied, provides adequate cooling to prevent or stop the boiling of the liquid and reduce the excess vapor pressure and strong venting.

2. Demonstrate the proper application of water before lighting the fire, because flame distracts the attention of the class. State that in fixed water fog systems as little as 0.1 gallon of water per minute per square foot of surface to be cooled often is adequate for cooling the contents of the container. Show that impinging a straight stream on a vessel is ineffective because so much of the water bounces off. Uniform spray distribution is the best. Many times there is a deficiency of water, and it must be used economically. In other cases drainage may be poor and areas may be flooded with burning fuel, endangering firemen and exposed nearby facilities. In many fires water has been wasted so that critical streams have had inadequate nozzle pressure to reach their objectives.

3. Pour about 5 to 8 gallons of gasoline around the drum and ignite it. While the drum is warming, discuss the points that are covered in the preceding paragraph, but be alert to the start of strong venting of the vapor.

4. Point out to the students that vapors projected into the air will normally disperse into the air quickly and not seek ground level and be ignited by the flames below them. Do not try to ignite the vapor at the vent. Unless the ground fire flames are near the vent, the vapors will not ignite but will disperse into the air readily, even with no wind. Remember, it requires a vapor concentration of 1 percent vapor in air to reach the lower flammable limit. As the gasoline in the drum becomes warmer the venting will increase, but probably without ignition, especially if there is a breeze.

5. If a full drum has been used as illustrated, the liquid level in the drum will be an inch or so below the top head. As it starts to boil, liquid gasoline sprays out of the vent and falls on the drum, and the vent

16596

should ignite. If it does not, ignite the vent yourself, using an oil-soaked rag tied to the end of the 20-foot pipe. Now the vent will burn with a brisk flame, and you are ready to demonstrate the cooling.

6. Using the garden hose, cover the top of the drum with water until it spills over the rim and runs down the sides. Also cool the side of the drum, especially the downwind side where the hottest flames from the ground fire are.

7. Be patient and continue the cooling until the vent fire dies down to a flicker. (It may require a few minutes of cooling to stop the boiling and strong flame.) At this stage the residual ground fire, if any, should be flushed away from the drum and burned out. The vent fire will extinguish itself as the drum is cooled.

8. Read again the precautions to avoid developing a flammable vapor-air mixture in the drum.

Drill 10

Objective. To demonstrate the dissipation of vapor from an outdoor ground spill of gasoline. This demonstration is satisfactory only if there is no wind; otherwise, the vapor dissipates too rapidly for detection.

Prop. In a flat, open area prepare a shallow circular dike with a diameter of 6 feet or more. Fill it with water and let it soak in. Provide a combustible vapor indicator. Check the indicator (see Paper 15, pages 103 to 106) to see that it functions satisfactorily. Make a long-handled torch by rolling a wad of rag on a handle and tying it in place.

Procedure.

1. Explain to the students the differences between a vapor release from an elevated vent, as shown by Drill 9, and a quiet release from a ground spill, as shown in this drill.

2. Compare the lesser hazard of a ground spill in the open where there is air movement (even with no wind) and a similar spill indoors or in a depressed area like a pit at a service station.

3. Using a rag wet with gasoline, demonstrate the use of combustible vapor indicators.

4. Fill the shallow diked area with about 1-2 inches of water, warn everyone not to smoke, and add about a 1/4-inch layer of gasoline to the water.

16597

5. Promptly start checking at ground level around the outside of the dike with the sample tube of the indicator. If there is a very slight breeze, preferably check downwind, and mark on the ground the limit of vapor drift as shown by a trace indication on the instrument dial.

6. Move the students back from the pool and light the torch. Start the test flame a greater distance away from the pool than the ground mark where the trace indication was noted by the instrument and work up to the dike until the vapor is ignited.

7. Let the fuel burn off completely, and then quench the area thoroughly with water fog.

8. Again demonstrate to the students the use of the vapor indicator with a gasoline-wet rag and explain the range of the dial on the instrument. This dial ranges between zero and about 1 percent vapor in air. The top of the dial or range is at the lower flammable limit of the vapor in air. The instrument is designed to indicate a trace of vapor in air. If there were no air movement and the demonstration could be made under ideal test conditions, the trace mark on the ground would be much farther away from the dike than where the torch ignited the vapor.

   Point out that, when the gasoline pool first starts to evaporate, the very lightest components are given off first; and these vapors, if 100 percent pure, are about twice as heavy as air. However, they dissipate rapidly into the air, and the mixture has almost the same vapor density as pure air. Before long, the next less-volatile components evaporate and also are lost. The evaporation then proceeds at a much lower rate as the still heavier materials evaporate.

   Gasoline vapor sometimes is listed as about three to four times as heavy as air. This would be true if all the gasoline were vaporized and trapped and the density of the 100 percent pure components were measured. As the vapor mixes with air, and evaporates in the open, however, the mixture is almost the same weight as pure air. Hence, it dissipates rapidly. (The purpose of this demonstration is not to minimize the hazard of gasoline vapor but to point out how rapidly it dissipates in the open.)

9. Wet down the area again with water fog to insure quenching of all embers. Add water to the pool again and cover the water with gasoline. (Students benefit from a repeat performance.)

10. Check around the dike with the combustible indicator, or preferably have one of the more attentive students do the job.

16598

11. Have another student explore with the lighted torch, as in Step 5, and compare the results with Steps 4 and 5. If he uses a long-handled torch and common-sense safety, the ignition should not be a hazard.

12. Explain that, if the pool were 100 feet in diameter, the greater distance of vapor drift would be too risky to experiment with.

13. Point out the difference between a spill on land and on open water. A spill on land usually results in a pool of some depth--possibly an inch or more. The vapor is released slowly because the surface is limited. The same amount of gasoline on water quickly spreads out to a very thin layer. Evaporation is much faster, and the area is larger for dissipation. On open water the evaporation of the volatile components is very rapid, particularly in a breeze or on choppy water. Confined under docks, it is slower and the vapor dissipation may be restricted and hazardous. The hazard can be reduced by churning up the water with straight streams, but nearby sources of ignition must be controlled promptly.

Drill 11

Objective. To demonstrate the difference between an outdoor and an indoor demonstration, which is much more hazardous. The instructor may not have a suitable prop for this drill; if not, he can point out the principles verbally.

Prop. On some existing drill grounds there may be a deep trench or an open-top tank with side walls 3 feet high or higher. In order to secure the best results, the test should be run where there is no wind. Again, a combustible vapor indicator and long-handled torch are needed.

Procedure. This test should be made right after Drill 10, while the lessons learned are fresh in the students' minds.

1. Fill the bottom of the trench or tank with water in order to secure a flat surface. Stop all smoking.

2. Put a 1/4-inch layer of gasoline in the container, wait a minute or two, and start checking with the indicator over the rim of the container for vapor. Point out the fact that, with no wind, the side walls of the container retain the vapor differently from Drill 10, and hence a blanket of vapor builds up. In this case it should be possible to pick up a trace of vapor higher up in the container. Closer to the liquid level, the instrument will read higher on the scale. Each time a reading is taken, of course, the sample tube should be removed from the vapor area, and the tube and instrument should be purged with clean air.

16599

3. After exploration with the instrument is completed, use the torch to ignite the vapor. The students should stand back from the vapor flash.

4. Now explain how and why the vapor has not had the chance to dissipate into the surrounding air, why it drifts and seeks lower depressions, and in a house, may drift along the floor, through open doors, etc.

5. Following up with a blackboard talk, show how only a small amount of liquid gasoline can make a large container explosive. If one gallon evaporates fully in a 10,000-gallon truck tank, it will produce about 200 gallons of gasoline vapor. If this vapor is mixed thoroughly with the air in the tank, the mixture will contain about 2 percent vapor. Does this make an explosive mixture in the tank? The flammable or explosive limits of gasoline vapor in the air are about 1 to 7 percent. Hence, the mixture would be explosive.

   If one quart of gasoline was used, the fully mixed atmosphere in the tank would be 0.5 percent or too lean to ignite; and if 10 gallons were used, the mixture would be 20 percent vapor, or too rich to explode. In large containers with no air movement, there is a tendency for the heavier vapor to stratify, so whether 1 quart, 1 gallon, or 10 gallons of fuel were used, there could be zones in the tank where the mixture would be too lean, and other areas where it would be too rich, and others where it would be explosive. This uncertainty justifies the old statement that, "The empty tank is the dangerous one!" In large tanks vapors tend to dissipate fairly uniformly throughout the tank. They may stratify somewhat, however, with a higher concentration near the bottom and lighter concentration at the top.

6. Take the time to discuss that no-smoking rule in Drills 10 and 11, which may elicit comments from students who have heard that you cannot ignite gasoline vapor with the hot ash from a cigarette. Discussion of this subject takes valuable time from the training work and you may wish to dismiss the question; but unless it is handled properly, incorrect assumptions may be made.

   In 99 out of 100 times, a burning cigarette can be doused in a bucket of gasoline without ignition. The glowing ash is surrounded by a blanket of inert products of combustion; and also, it may not be hot enough or contain sufficient energy to ignite gasoline vapor, although it might ignite other more easily ignitable materials.

   Using the bucket prop, demonstrate two other acts:

   - Light a cigarette, and drop the flaming match into the bucket.

- With the cigarette ignite some paper or other Class A material, and drop it into the bucket.

The fact that the hot ash of a cigarette normally does not ignite vapor is only of novel and academic interest, because the other operations that accompany smoking are demonstrably hazardous.

Drills 12A and 12B

Objective. To demonstrate the vapor drift from a release of LP gas. This simple demonstration was used at both Bakersfield Oil Fire Control Schools.

Prop. Have a butane bottle with flexible hose leading to a 20-foot piece of pipe. Supply six or eight flare pots. (This test works best, of course, on a day when there is no wind.)

Drill 12A

Procedure. Explain that the demonstration is shown in two parts (12A and 12B). The first part illustrates the vapor drift from a liquid spill. As in the case of all of these drills, run your own dress rehearsal to polish the demonstration.

Some variances from these instructions may be desirable, depending upon the equipment used, and terrain, weather conditions, etc. Study Paper 13, pages 90 to 96, and Fig. 83.

1. Connect the hose to the liquid side of the butane container and attach the 20-foot pipe.

2. Place the flare pots in a semicircle with a diameter of 20 feet. Space them equally around the outlet of the pipe.

3. Explain to the students the purpose of the demonstration. Point out to them that, when the liquid butane is released from the bottle, it will be heated by the hose and pipe and the released butane vapor will be invisible at first. When the hose and pipe are chilled to about 31° F (the boiling point of butane), there will not be sufficient heat left in the hose and pipe to evaporate all of the fuel, and it will be discharged as a spray.

   This spray freezes the moisture out of the air, producing a visible water fog, not butane fog. The butane is invisible and extends beyond the fog. If propane is used, more fog will be produced as its boiling point is 44° below zero. Both butane and propane vapor, in 100 percent concentration, are heavier than air. Butane vapor is twice as heavy as air, and pure propane vapor is 1.5 times as heavy.

Remind the students that in Drill 10 the heavy gasoline vapor quickly dissipated in the air and air-vapor mixture, being about as light as the air, disappeared rapidly. The LP gas vapor, being lighter than gasoline vapor, may disappear even faster.

Point out that these facts relate to fairly small spills. If, however, there are massive spills of either gasoline or LP gas, much more fuel is available, much more vapor is produced, and under quiet wind conditions the vapor can drift a considerable distance and be ignited. It is impractical to demonstrate massive spills; small releases are used only to demonstrate general principles.

4. Ignite the pots and release the liquid butane to the pipe. (Dress rehearsal checks will have shown the desired rate of release to show the vapor drift and the preferred distance of the flares from the end of the pipe.)

5. On ignition, shut off the fuel at the bottle and repeat the test several times.

Drill 12B

This second part of Drill 12 shows how a fog nozzle aids in hastening the dissipation of the vapor.

Fig. 93

1. Using a booster line, turn on the fog nozzle and--without releasing the butane--demonstrate the method used to dissipate the vapor.

2. Have your assistant open the bottle at the same rate used in Drill 10 and show the effectiveness of water fog.

Drill 13

Objective. To demonstrate the effectiveness of water fog to cool a surface and prevent it from overheating, even when in direct contact with a fire.

Prop. Make a 2- × 3-foot frame, using small boards such as 1/2- × 2-inch pieces. Thumbtack to the frame a piece of waterproof paper, such as butcher paper. Mount the frame on two light

166002

sticks about 2-3 feet above the ground. Provide the LP gas bottle and hose as used in Drill 12. Use a garden hose with a small adjustable water spray nozzle. A booster line is much too large. Connect the hose to the vapor side of the bottle. This prop is illustrated in Figs. 21 and 93.

Procedure.

1. Explain to the students the purpose of the test. Tell them that you will apply a very light spray of water on the paper and then direct an LP gas flame upon the paper. This very small amount of water, uniformly applied, will prevent the flame from igniting the paper. Then you will quickly remove the spray and the paper will ignite suddenly. The purpose of the test is to show how small an amount of water is needed to do the job.

2. While you are wetting the paper, have your assistant turn on the butane vapor and ignite it. Be sure that the flame impinges directly against the wet paper.

3. Call attention to the very small amount of water that is being used and tell the students to watch the paper carefully when you remove the cooling.

4. Quickly turn the spray stream away from the paper, and see how quickly the paper ignites.

5. Turn off the fire and water stream.

6. Arrange for a continuation of the discussion of this subject using a blackboard classroom session.

Later blackboard talk. This is a most important phase of this drill. The field demonstration is spectacular, but it is so short that students lose its value unless it is followed up with a blackboard talk and group discussion.

Before the students arrive, sketch on the blackboard a vertical tank as used in a bulk plant; an elevated horizontal tank as used in many industrial plants; a "semi" gasoline tank truck; and a horizontal LP gas tank on a tank truck. Refresh your mind by studying Paper 5, pages 39 to 50.

Tell the students that you are going to talk about the practical aspects of the use of water in cooling various types of tanks containing oil and LP gas. Point out that there are differences in the handling of these various kinds of fires and there are also similarities. Take one case at a time and cover these differences and similarities. First, cover the similarities that apply to all cases. Before getting down to specific cases, review some common principles. (This should be a participation session, not a lecture. It is impractical to detail

166003

WS. 19. Stop Block: Make a three-view freehand sketch of the Stop Block. Show top, front, and right end views. Follow directions given for WS 15. Have your drawing checked. Save it for later grading.

WS. 24. V Block: Make a three-view freehand sketch of the V Block. Show top, front, and right end views. Follow directions given for WS 15. Have your drawing checked. Save it for later grading.

WS. 25. Angle Guide: Make a three-view freehand sketch of the Angle Guide. Show top, front, and right end views. Follow directions given for WS 15. Have your drawing checked. Save it for later grading.

all of the points that you may wish to present, but some of the key points to be covered follow.)

In your opening remarks, review the last field demonstration. Point out that water is such a good material for controlling fires because it is nonflammable and safe to use; cheap and often available in quantity; easy to pump and handle and--very important--if used properly, it has the property of absorbing a great amount of heat. Water will not extinguish gasoline, an LP gas, or a gas fire in the open, because it cannot reduce the temperature of the fuel to below its flash point and stop the release of vapor; but, properly used, it is ideal for cooling equipment, reducing the intensity of the fire, and preventing failures of pressure vessels or inadequately vented vessels.

Illustrate the application of the above with four examples on the blackboard.

1. The vertical oil storage tank--Assume that the tank contains gasoline and that there is a fire burning around the bottom of the tank. When sizing up the problem, the chief must consider several factors.

   a. What is the source of fuel, and can it be shut off?
   b. Is the tank adequately vented? In his prefire planning sessions at the plant the chief will have determined the adequacy of vents (see Fig. 16 and related text).
   c. Is more than one tank exposed, and howis it vented?
   d. What is the area drainage? Can the ground fire be flushed away so that the flames will be in the open and not contact exposures? What initial steps should be taken? (These depend upon the situation at hand but some general factors apply.)
   e. If the fuel is coming from a leak at the bottom of one of the tanks, can it possibly be shut off by adding water to the tank--if open valves permit--using one of the procedures covered in Drill 7 and 8?

The boiling of the oil in the tank can be prevented by the procedure used in Drill 9. A minimum of water should be lofted on top of the cone of the tank so that a thin sheet runs down the side of the tank exposed to fire. Impinging a stream on the vertical side wall of the tank and bouncing the water off the tank is of no value, for very little cooling is accomplished and the excess water on the ground can create a bad run-off problem.

The atmosphere in a bulk plant gasoline tank is above its flammable limit, with no risk of internal explosion. The internal vapor pressure in the tank can be checked by the rate of venting. A small flame indicates no significant pressure and no need for cooling. Excess pressure is indicated by a much larger flame, usually accompanied by noise of venting when proper cooling of the tank is needed.

Fig. 94. The main rule in fighting tank fires is to concentrate the water where it is needed. Radiant heat is no hazard to tank shells—only direct flames can overheat the tank shell to the danger point. Work from the sides of the exposed tank—not from the ends.

Fig. 95. Again—don't waste water on unexposed tanks. Close the valves of nearby tanks and concentrate the water where it is needed.

A serious spread of the ground fire usually results from needless water on adjacent tanks that are not venting and especially from the indiscriminate use of water thrown into the ground fire itself.

Finally, it is assumed that the tank is adequately protected by a weak roof-to-shell seam or properly sized venting equipment.

16605

2. A horizontal tank--The NFPA motion picture Fighting Tank Fires covers the principles that are particularly applicable to the horizontal tank; the need for prefire planning and training; proper venting; cooling the top of the tank while working from the sides and not the ends; early attention to light steel supporting structure, if used.

3. A gasoline tank truck--Refer to Paper 10, pages 79 to 83.

4. An LP gas tank truck--Refer to Paper 13, pages 90 to 96.

   In this case it is particularly important to apply water cooling streams on the top of the tank shell above the liquid level. This prevents the flames from overheating the shell, which can bulge and rupture even though the vents are holding the internal pressure down to the setting pressure of the valves. The same cooling method should be applied to fixed or plant installations of LP gas storage.

16607

SECTION 4 HISTORY OF TRAINING IN THE WEST

Whether a training officer is planning a new program or revising an old one, he can benefit greatly from the experience of others. This is particularly applicable to training in oil fire control. This special work is a fairly new activity in the fire service.

The first oil fire control training was conducted by refinery fire departments in the early 1920's. Some years later the Los Angeles County and Kern County Fire Departments, in widely separated oil field areas, independently started joint training work with the industry. Fear of sabotage during World War II intensified this cooperative work, and the fire service joined the oil industry in conducting large oil fire schools. Some individual fire departments trained their men on local oil industry drill grounds.

The first really large schools were held in Bakersfield in 1955 and 1961, and many smaller schools have been conducted in most of the western states during the last 10 years. Today the Los Angeles County Fire Department has one of the largest and finest drill grounds in the country, and at the dedication of the new area in 1962 Chief Klinger said that it will be made available to other departments. Cooperative training like this is the culmination of the work of many years.

Early Oil Fire Control Schools

The need for oil fire control. The petroleum industry started in California before 1900. Shortly following the discovery of the oil fields in Southern California in the early 1920's, there was a surplus of crude oil, and much of it was stored in large, shallow, concrete-lined, wood-and-tar-paper-roofed reservoirs and nonsteel-roofed tanks. These roofs were vulnerable to lightning ignition, prior to the use of lightning protection, and a number of costly and very spectacular fires occurred in remote areas. Commercial scale, high pressure and high temperature (about 1000 psi and 800° F) cracking units, before the advent of alloy steels, accounted for some early serious refinery fires. Large well fires in the oil fields were common. Oil companies assigned fire protection engineers to find methods of preventing and combating these serious fires. The engineers from different oil companies worked jointly and formed the first oil industry fire committee about 1925.

16608

This group of engineers (Anfenger, Moeller, Prussing, Wilson, and Knobman) and their assistants were known initially as "the Buzzards" as they met at large oil fires and picked the bones of information clean to learn all the possible lessons of fire protection from these losses. Later they formed a permanent committee, which eventually became the Western Oil and Gas Association Fire Committee. Their pioneer development and research into all phases of fire protection on flammable and combustible liquids and LP gas led to many of the early codes and standards of the American Petroleum Institute, the National Fire Protection Association, and the National Board of Fire Underwriters. Some of the local fire chiefs also participated in the early study of oil fire fighting techniques, including the special training of firemen.

First training. The earliest oil fire training was done in the refineries in the middle 1920's; the first training conducted jointly by the fire service and industry was in the oil fields in the early 1930's. The first permanent drill area with large props was constructed about 1933 at the Los Angeles County Fire Department Station 17 at Santa Fe Springs, on the grounds where Chief Griswold had conducted his first work on fog nozzles a few years earlier (see Fig. 22 to 25). Chiefs Griswold and Klinger, Stanley Clithero of General Petroleum Corp., and other engineers were the pioneers. Mr. Clithero also worked with Chiefs Freer, Van Horn, and Craig of the Kern County Fire Department at Bakersfield in similar testing and training starting about 1935.

During the early part of World War II the navy set up drill grounds at Mare Island and San Pedro for training sailors in the handling of ships' fires. Fire service personnel and oil industry fire protection people witnessed this work. Navy drill grounds stimulated the construction of permanent oil industry drill grounds with large props that resembled refinery equipment and provided refinery-type fires.

Up to 1941 all of the oil fire control schools were conducted at a local level, mainly in oil field and refinery areas, and only the local firemen benefited.

First Bakersfield fire school. In order to spread this benefit, the Kern County Fire Department, the Bureau of Trade and Industrial Education of California State Department of Education, and the Western Oil and Gas Association Fire Committee jointly sponsored the first large-scale oil fire control school at Bakersfield on January 29, 30, and 31, 1941. The general format resembled those schools conducted in 1955 and 1961, for the program included indoor classroom sessions and outdoor demonstrations and participation drills.

At that time, liquefied petroleum gas was first being used in large quantities, and many of the drills covered the handling of LP gas fires. Motion pictures of this first Bakersfield fire school show some of the early techniques. This training included:

16609

Fig. 96. Fire training at a refinery drill ground in the early 1930's. City firemen and refinerymen are using a CO_2 extinguisher and a 40-gallon foam extinguisher.

16610

Fig. 97. Two photographs of historical interest. The upper picture shows refinerymen using two steam lances to snuff out a heavy oil fire at their drill ground. The Civil War cannon was used by Texas firemen prior to 1920 to shoot a 3-inch ball into tanks that were on fire. In one case they overshot the flaming tank but hit the tank in back of it and lost both tanks. After several trials, this method of hastening the draining was found to be of no value and was discontinued.

16610

- LP gas fires--An open straight jet of LP gas was ignited. The control valve near the outlet of the jet was closed under the protection of water fog. The fog pattern did not appear to be very efficient. The jet flame was extinguished with dry chemical and with CO_2, and no doubt, the men were warned that this was an unsafe technique because of the risk of reignition.

  An elbow was put on the end of the LP gas pipe to direct the stream onto the ground below, and shutoffs were made under the protection of fog nozzles. The stream was deflected against a steel baffle and the same technique was used. A strong straight stream was used at right angles to the jet to deflect the LP gas streams to one side, and a shutoff was made. The radiant heat from the deflected flame was much less than for a comparable oil fire, and it permitted approach with fog nozzles.

- Oil fires--Crude oil was substituted for LP gas for the straight jet fire, and shutoffs were made.

  Open-top drum fires were extinguished with foam and CO_2, and high flash oils were extinguished with fog applicators.

  A tar pit was frothed out with water.

  Shallow pan fires, using gasoline and crude oil, were tackled with a fog applicator to show that fog reduces the size of the fire but does not extinguish it.

  Various oil spill fires were extinguished with dry chemical and small spills were extinguished with CO_2 and hand foam extinguishers.

- Miscellaneous fires-- Tank truck dome fires were extinguished with a blanket and by closing the dome cover.

  A wrecked automobile was ignited, and the fire was fought by various methods.

  A foam tower was erected, and the operations of chemical foam generators were demonstrated. Unfortunately, no photographs other than one movie film could be found. This movie is listed in Part IV.

The main purpose of the 1941 Bakersfield Oil Fire Control School was to prepare the student representatives of local fire departments so well that they could return home and conduct adequate training programs on a continuing basis for fire departments in their own areas. A fire marshal of a major California city commented on the schools:

16611

Los Angeles County Fire Department

Fig. 98. Early day photos showing training at Station 17 at Santa Fe Springs. The prop is a rectangular tank, supported on concrete piers over an oil pit. The 1½-inch directional fog nozzle in both photos appears to be of the same type as that shown in Fig. 23. The applicator appears to be on an early type of navy nozzle.

> These sessions will have saved the lives of firemen who otherwise might have been lost had they not gained the knowledge and understanding of the fire characteristics of petroleum products which the schools afforded them. There are many instances in other parts of the United States where firemen have died because they had had no such training.

Regarding the 1941 school, Assistant Chief Harry Van Horn, Kern County Fire Department, in charge of oil fire fighting, said recently:

> In the early days we had many fires in the oil fields, and we handled them the best we could, with brute strength and awkwardness. In the 1930's oil industry fire protection people started to teach us the technical side of the problem and the proper techniques to use in the field. This work was not only very interesting but we tackled our fires with confidence and with much greater safety to ourselves.
>
> These small local schools led up to the first oil fire control school here in Bakersfield in 1941. During the last 20 years the oil industry men and our department have jointly conducted many small schools as well as the two large ones in 1955 and 1961. Any fire department can become proficient in this special kind of fire prevention and control if they will learn the principles as taught in the classroom and then train on live fires on the drill ground.

Other early schools. The war stimulated interest in oil fire control schools. In Long Beach on July 29, 30, and 31, 1941, a school was conducted by the fire service and the oil industry. In his speech there, Chief Griswold said:

> Some of us representing fire departments, who have had the opportunity to work with the industry engineers, face the war future with confidence because of the assurance of their engineers' support. Their fire fighting practices and procedures, as exemplified in this school, will unite the fire department and oil industry into an organization which will defy anything the Axis powers can give.

We have no records of the specific props or training techniques that were used at Long Beach, but we assume that they were similar to those used elsewhere at that time. Firemen from the Southern California Area attended. A number of similar schools were held in other West Coast cities in 1941 and 1942.

Modern Oil Fire Control Schools

Large fire schools. During the war the Great Lakes Regional Committee on Protection of Petroleum Facilities sponsored a large-scale school in Chicago.

16612

WS. 26. Inclined Planes; Make a three-view freehand sketch of the Inclined Planes block. Show top, front, and right end views. Follow directions given for WS 15. Have your drawing checked. Now staple Work Sheets 23, 24, 25, and 26 together in the upper left-hand corner and turn them in for grading. One grade will be given for the four sketches.

The oil industry instructors who conducted the Bakersfield school in 1941 served as the "faculty" for the Chicago Fire School on May 24, 25, and 26, 1943. They developed and brought with them an excellent motion picture, Chicago Oil Fire Control School, the first fire control film that was specific to oil and LP gas fires.

At one of the sessions the instructor, commenting on over 15 years of fire protection experience of the school staff and also on the joint activity on the West Coast said:

> Out of this experience, there have been put together methods of teaching fire prevention and control to which each man had added what he seemed best qualified to contribute. For years this teaching technique was limited to the employees of the companies that we individually served. Then it was found that fire departments were interested, and some schools were run for their benefit. Now the war has brought into the picture of oil fire fighting not only the civilian fire departments, but specialists of the army, navy, and coast guard. And for groups of these men, fire schools have been conducted in several large cities of the Pacific Coast in the past year.

Los Angeles City Fire Department

Fig. 99. When an applicator for volumetric (low velocity) fog is not on hand, sometimes it is necessary to use the harder method with directional fog. Firemen should be trained to meet such problems. Here local city firemen are training at a refinery drill ground in 1945, using the old navy nozzle.

16613

The Chicago school consisted mainly of classroom and outdoor demonstration sessions. One prop was particularly interesting. A crude oil and butane mixture was pumped out of an open 2-inch flange, representing a split pipeline. The radiant heat from the vertical flame was particularly severe, and the problem was to move in under the protection of two 1-1/2-inch old-style spray nozzles and make a shutoff. Two streams from 5/8-inch straight-stream tips off a 1-inch hose were directed at the fire a few inches above where the jet flame was coming out of the pipe. These small streams bent the vertical fire away from the men at the valve and aided the fog nozzles.

The next school of importance was held in Fresno during the California Rural Fire Association conference on March 28, 29, and 30, 1947. The outdoor training was designed for rural fire departments and was conducted by the Western Oil and Gas Association Fire Committee. Small, inexpensive portable props were used, partly to demonstrate examples of what small fire departments could make for their own training.

Small local fire schools. From 1947 up to the time of the second Bakersfield School of 1955, only small schools were conducted. In the 1945-1955 period a number of the oil companies conducting training for their own employees invited local fire departments to participate. At one refinery the local fire department's training officers were given special instruction, and they, in turn, trained their own fire service personnel. At one refinery over 2000 received this training course with classroom sessions and, in some cases, field work as well.

In many nonrefinery areas, instructors from individual oil companies ran special small schools for fire department personnel alone. Many motion pictures specific to fighting oil fires became available. Much attention was given to prefire planning with inplant sessions on simulated fires. In the investigation of larger fires, the fire service and oil industry cooperated closely so as to benefit jointly from the lessons that were learned. This was an important developmental period in oil fire protection from a standpoint of learning new techniques and new developments in fire fighting equipment. The latter included dry chemical extinguishers' replacing hand CO_2, foam, and CTC extinguishers. More efficient fog nozzles became available. Mechanical or air foam started to replace chemical foam at new installations, and an appreciation of the value of water in place of foam was generally recognized. The more maneuverable 1-1/2-inch hose lines were used in the majority of oil fires. The importance of drainage and of using water more effectively and in smaller amounts became evident. The training in the use of these newer and more effective concepts of oil fire control techniques required smaller classes, both in the classroom and on the drill grounds. Greater emphasis was given to prefire planning. The refineries found that fewer fires occurred when the operators were given live fire training.

16614

Kern County Fire Department

Fig. 100. Prefire planning and training on oil fires, illustrated above and by many other pictures, pays off when "the chips are down."

New developments in fire codes and fire prevention also took place even though there was resistance in some areas. Although new fire fighting equipment usually is accepted, there is a natural reluctance to change codes and standards. As information on current fire history improved, particularly through the NFPA publications, greater reliance was placed on experience, and codes were modernized for the benefit of both the fire service and industry.

A good example of this code change relates to heights of dikes around storage tanks. To comply with the old code, dikes often required walls 10 feet high or higher. Long experience indicated no need for such heights, and fire fighters had much trouble in combating tank fires behind these high barriers. Mainly through West Coast experience, the NFPA 30 code has been changed to a more practical and reasonable design. For example note the 1963 NFPA code on dikes and drainage. Continued cooperative work with the fire service and industry engineers has led to greater confidence in one another in the joint efforts of drafting codes.

In this period greater emphasis was given to prefire planning and a better technical knowledge of the fire characteristics of petroleum products. The fire schools contributed greatly in the dissemination of this knowledge. Examples of lack of proper prefire training have been stressed at the fire schools particularly through the use of the film on the Kansas City bulk plant fire of 1959 with supplemental discussion. Some recently available motion pictures have

16615

aided greatly. The increasing interest in the subject of oil fire control at the local level created a greater demand for similar schools in other communities, and this led to the second Bakersfield Oil Fire Control School in 1955.

Bakersfield fire schools of 1955 and 1961. Both of these three-day schools were jointly sponsored by the Fire Training Program, Bureau of Industrial Education, California State Department of Education; the Kern County Fire Department; and the Western Oil and Gas Association Fire Committee. Indoor classroom sessions were held during the mornings and evenings and the afternoons were devoted to demonstrations and participation drills at two local industry training grounds. There was no attendance fee. Approximately 600 registered for the March 24, 25, and 26, 1955, school and about 700 for the March 9, 10, and 11, 1961, school. Fire service officers and oil industry fire protection engineers were instructors. Guest participants on panels, etc., included:

Loren S. Bush, Chief Engineer, Board of Fire Underwriters of the Pacific
R. C. Stange, Assistant General Manager, National Board of Fire Underwriters
Paul Lofgren, Assistant Supervisor, Trade and Technical Teacher Training, University of California
Miles E. Woodworth, Flammable Liquids Engineer, NFPA

Los Angeles City Fire Department

16616

Certificates of Completion were issued by the California State Department of Education, Bureau of Industrial Education, Fire Training Program, to all participating firemen; and "red book" manuals, containing copies of the papers presented and other instructional material, were distributed. Many of these papers (some revised) comprise much of the material in the first two parts of this manual. A description of the outdoor work at these two schools is given in the first two sections of Part III. Comments from some who attended:

- K. E. Klinger, Chief Engineer, Los Angeles County Fire Department:

  I wish to express my sincere appreciation for permitting our personnel to attend the recent oil school seminar held in Bakersfield. I feel that the information derived will be very beneficial in our training procedures.

- R. M. Hill, Fire Marshal, Los Angeles City Fire Department:

  The opportunity to progress toward greater safety in the petroleum industry has been greatly enhanced by the enthusiastic

participation in the school of fire departments across the state. It is also evident that a greater understanding of our mutual problem has resulted.

- R. B. Hamilton, President, California Conference of Fire Training Officers, Southern Section:

By unanimous motion we wish to thank you and those responsible for the fine program at the oil fire control school. The representative oil companies and their facilities did an excellent job in preparing the various fire problems and the equipment assembled in the props did much to show good fire suppression techniques.

- M. C. Woodworth, Flammable Liquids Engineer, National Fire Protection Association and formerly Fire Marshal, Portland, Ore.

The oil fire control schools sponsored by the Western Oil and Gas Association in cooperation with the fire services are truly outstanding examples of working together on problems of mutual concern. Unquestionably these schools have improved the effectiveness of fire departments on the West Coast in fighting flammable liquid fires as well as increased the safety of the fire fighters in handling such incidents. I know of no other section of the world where such cooperation exists, with industry cooperating to train fire fighters in a number of different states as it does on the Pacific Coast.

I do suggest, however, that it is imperative that the lessons learned at these schools, to be truly effective, be taken back to the local fire departments and the principles learned at the school applied to their own local conditions. Special emphasis should be placed

16619

upon prefire planning of all flammable liquid and LP gas installations under the jurisdiction of each particular fire department. This prefire planning also should include the chemistry of fire as well as the variables of many types of flammable liquids that may be stored in a particular community. Since each flammable liquid in an LP gas bulk plant may present its own individual problems, such as the type of liquids stored, tank construction and design, piping arrangements and materials, and emergency venting provisions, prefire planning is a necessity for each plant.

Although many large departments are able to provide training centers with specialized flammable liquid fire problems to train their men, such elaborate training facilities are frequently impossible to obtain for small departments and volunteer fire departments. However, such large training aids are not a

Torrance Fire Department

Fig. 106. A typical large LP gas storage area at a large steel mill and fabricating plant. The principles of prefire training at bulk plants apply to storage and operating areas in other industrial plants as well. The training officer and the plant fire and safety supervisor are shown studying the problem with local fire service officers and firemen (top). Then (bottom) they used water streams from one of a number of selected locations.

16620

necessity, since there are many simple props which can be used for achieving the necessary fire fighting training. The same techniques can be demonstrated on a small basis as can be demonstrated on a large basis.

Other California fire schools. Other oil fire control schools have been conducted by the fire service alone, using techniques and portable props similar to those at the Bakersfield schools. Two excellent schools were held in San Jose (August 16-17, 1961, and August 15-16, 1962) and one in Coachella Valley on November 3-4, 1962, with attendance at each school ranging from 150 to 200 firemen. A full-size tank truck prop was used at the last San Jose School. It is illustrated in the NFPA Fireman, February, 1962, and the entire school was described in Fire Engineering, February, 1962.

The largest and best-equipped drill ground for training oil fire control personnel is located at Del Valle, near Castaic Junction, north of Los Angeles. The facility was designed and is supervised by Chief Bixler of the Los Angeles County Fire Department. The aerial photograph, Fig. 112, illustrates the 260-foot by 20-foot area prior to installation of all props. Figures 113 to 116 and Fig. 47 show some of the modern props in use there. The area was dedicated in October, 1962, and it is available for use by fire departments in Southern California.

Schools in Other States

A number of large fire schools have been held in other western states. The majority were conducted jointly by the state supervisor of fire training, the

UNIT V — INSTRUMENT WORKING DRAWINGS

General Information

A working drawing made with instruments is used in industry to guide the workman in making an accurate part or complete product for the commercial market. The chief job of the draftsman in industry is to do detailed drawings and assembly drawings. The workman must have a complete understanding of what is required for the exact shape and size of the part he is concerned with in his work. Mistakes in the drafting room can be costly if allowed to go into production. The draftsman must see that his drawings do not become the cause of costly mistakes. He must do all lettering carefully and neatly and his dimensioning must be accurate and easily read.

The use of triangles, T-square, and compass have been included in previous units. These, along with the architect's scale, are considered to be basic drafting tools. The draftsman, designer, engineer, and architect use a wide variety of precision instruments and special equipment to produce very accurate, exact drawings. It should not be concluded, however, that instruments alone will insure professional results. The usefulness and appearance of any drawing depend chiefly on the person making the drawing and <u>not on the tools</u>. Drawing instruments are available individually or in sets. Sets, depending on the quality and price, usually include as a minimum two compasses of the same type (friction or spring joint) but of different sizes for large and small circles and arcs; a divider, used to lay

local fire department, and members of the Fire Committee of the Western Oil and Gas Association. The larger schools of which there is record are given in Table 11.

Figures 103 to 108 for Tacoma, and Fig. 109 to 111, inclusive, for Kennewick show that the majority of the props were similar to those used in the California schools. The overall patterns for indoor basic and outdoor demonstration and participation drills also were similar. Lyle Goodrich, Supervisor of Fireman Training Programs, has conducted excellent schools in the Northwest. Figures 117 and 118 illustrate excellent inexpensive props that were used in the 1963 school at Sparks, Nevada.

16625

Los Angeles County Fire Department

This prop, made from 2-inch pipe and a flange with the bottom third of the gasket cut out, is inexpensive and a good training aid.

16626

SECTION 5 QUESTIONS AND ANSWERS

Review examinations at the 1955 and 1961 fire schools in Bakersfield were given to all students during the two evening sessions. The large group was divided into small groups and each met in separate classrooms at the local high school. The examinations served a number of purposes.

- Each student found out how well he had learned his lessons.
- He secured the answers to questions that he did not know.
- Lively beneficial discussions developed, particularly on controversial subjects.

Following are two sets of questions, which were used at the 1961 school. For the benefit of others who may read this chapter, it is suggested that you do not mark the answers in this manual. Use a separate sheet of scrap paper for listing your answers and compare them with the correct answers, which follow the questions.

16627

INSTRUCTION SHEET FOR REVIEW QUESTIONS

Part I

The review is divided into two parts. One part will be given each day for that day's work.

You will be given two sets of questions. You will complete one set and then copy your answers onto the second set. You will give one set to your group leader, and you may keep the other for reference during the discussion period that will follow the review.

Tips for the student: Do not try to answer the questions in their numerical order. Read through the set and first answer those that are easy to answer. Then return and devote more time to those that are more difficult. Hold the most difficult ones for the last. Answer as many as you can.

There are no "trick" questions in this review. Some are more difficult than others. It is not expected that all students will be able to answer all questions correctly.

After the review is completed, the group leader will give you the correct answers so that you can correct your duplicate set of questions and keep it. Feel free to challenge the leader on any point with which you do not agree or to ask questions about any point that is not clear to you.

One of the objectives of the review is to stimulate group discussion. Take advantage of the opportunity.

REVIEW QUESTIONS
Part I

_____ _____
Name of Participant City State

_____
Score

Instructions: Draw a circle around the letter "T" if the statement is true, or around the letter "F" if the statement is false, or fill in the blank at right in the multiple choice questions.

1. One of the important purposes of conducting this fire school is to acquaint the fire service with the properties of various oils and gases so that firemen can combat these fires with better understanding, effectiveness, and safety to themselves. T F

2. Another one of the purposes is to enable you to do a better job of fire prevention and fire investigation when petroleum oils and gases are involved. T F

3. All oil fuels must be in the form of vapor in order to ignite. T F

4. The flash point is the temperature to which oil must be heated in order for the vapor given off from the oil to ignite:

   (a) Without any applied source of ignition
   (b) If a flame is brought near the surface of the oil

   _____ (a or b)

5. Gasoline gives off flammable amounts of vapor even at temperatures well below zero. T F

6. Kerosene, stove oil, and diesel oil give off sufficient vapor at summer temperatures (100° F) to ignite readily. T F

7. An odorant is added to LP gas to make it easier to detect when it leaks. T F

8. Any visible spark ignites gasoline vapor. T F

9. Gasoline vapor, even though heavier than air, is readily dispersed by wind. T F

10. Everyone with nails in his shoes should be kept away from a gasoline spill because sparks from the nails are a potential source of ignition. T F

11. Which of the following fuels will ignite spontaneously?

    (a) A rag wet with petroleum oils
    (b) A rag wet with linseed oil or paint
    (c) A rag wet with gasoline

    (a, b, or c)

12. Which one of the following fuels has the highest flash point?

    (a) Lubricating oil
    (b) Cleaning solvent
    (c) Gasoline
    (d) Butane

    (a, b, c, or d)

13. Gasoline spilled onto water tends to spread out in a thin layer, and in a short time it evaporates to the point where it may be difficult to ignite. T F

14. Evaporation of gasoline spilled on water can be accelerated by agitating the surface with straight water streams. T F

15. If open-flame warning devices are used at the scene of an accident involving a gasoline spill on the highway, extreme care should be taken to place them out of the range of possible vapor travel. T F

16. The cleaning solvent sold in most service stations is a high flash point solvent, which cannot be ignited until its temperature is raised to above 100° F. T F

16630

17. Dispersal of a heavy vapor such as LP gas vapor will be assisted by the use of a spray stream from a fog nozzle. T F

REVIEW QUESTIONS
Part II

Name of Participant _____ City _____ State _____

Score _____

Instructions: Draw a circle around the letter "T" if the statement is true, or around the letter "F" if the statement is false, or fill in the blank at right in the multiple choice questions.

1. Assume an LP gas tank truck has been involved in an accident and is producing a leak, which is burning like a jet directed outward or upward, with no flame touching the tank shell. The best procedure is to:

   (a) Attempt to extinguish the flame with hand extinguishers or water fog.
   (b) Let it burn.
   (c) Apply water to keep the entire tank shell wet.

   (a, b, or c) _____

2. Same as above except that flame is playing against the shell of the tank. The best procedure is to:

   (a) Let it burn.
   (b) Attempt to extinguish the fire.
   (c) Apply water spray to cover the entire tank shell.
   (d) Concentrate available water particularly on the shell above the liquid level where most severely exposed to flame.

   (a, b, c, or d) _____

3. A gasoline tank truck has been involved in an accident, perforating the tank, so that liquid gasoline is spilling to feed a fire on the ground. The best procedure is to:

16633

(a) Keep all people, including firemen, well away from the truck.
(b) Attempt to flush burning gasoline away from the truck with hose streams.
(c) Shoot holes in the tank.
(d) Attempt to keep the fire-exposed portions of the shell wet with water.

(a, b, c, or d)

4. A fill opening fire occurs during the loading of a tank truck at a loading rack and the flow has been cut off, but the fill stem is still in place. The best procedure is to:

(a) Let the fire burn.
(b) Pull the tank truck out from under the loading rack.
(c) Remove the fill stem and close the cover.
(d) Extinguish with a hand extinguisher.

(a, b, c, or d)

5. Assume that an underground tank at a service station is being filled from a tank truck, and a small fire occurs at such a location that the usual control valve cannot be reached. The best procedure is to:

(a) Drive the truck away.
(b) Shut off the flow by means of the remote emergency release.

(a or b)

6. Suppose, during the filling of an underground tank from a tank truck, the vapors issuing from the vent become ignited. The best thing to do is to continue the flow so as to prevent the flame from flashing back into the tank. T F

7. The water hose at the service station pump block is the best extinguisher for upholstery fires. T F

8. If the dispenser at a service station is knocked over by an automobile, no more than a gallon or two of gasoline is likely to be spilled. T F

9. Let us assume that a severe fire is burning on the ground around a conventional 10-foot by 30-foot vertical gasoline tank two-thirds full. The gasoline in the tank will not explode. T F

16634

10. Assume the gasoline in the same tank starts to boil and the vent cannot handle the vapor. The roof pulls loose from the shell. It is likely that the gasoline will boil over and cause a severe spread of fire on the ground. T F

11. A tar pot containing very hot asphalt catches on fire. One good way to extinguish it is to agitate it with a straight water stream. T F

12. A leak in the bottom of an oil storage tank can cause an oil spill that could be serious if ignited. Introducing water into the tank to float the oil above the level of the leak is a good emergency measure. T F

13. In a spill fire involving hot asphalt or heavy fuel oil, a good method of extinguishment is gently to spray the surface with water to produce a froth. T F

14. Where a large LP gas storage vessel designed to nationally recognized standards has failed in a fire, the cause has most likely been that:

    (a) The product in the vessel exploded like TNT
    (b) The pressure in the vessel greatly exceeded the relief valve setting.
    (c) The fire softened the unwetted portion of the shell above the liquid until it bulged out and failed.

    (a, b, or c)

15. It is always important to open the main electric service switch before starting to fight a fire in a service station. T F

16. A large burning stream of gasoline issuing under pressure from a leak can seldom be extinguished with water spray. T F

17. Fog nozzles may be much more effective in the control of oil fires than straight streams where close approach to the fire is possible. T F

166.35

OIL FIRE CONTROL SCHOOL

Bakersfield, California
March 24-26, 1955

REVIEW QUESTIONS

A few questions that were used in the 1955 school were not used in the 1961 school because other questions were substituted for them. Some of these 1955 questions are added below for further review.

18. A spark produced below the surface of gasoline liquid will cause it to explode. T F

19. Water spray is good for killing a fire involving a fuel with a flash point above atmospheric temperature because the water spray cools off the burning oil surface and stops the evolution of vapor. T F

20. An open, shallow 10- by 10-foot pit of gasoline is on fire. It can be extinguished with spray alone. T F

21. The same pit contains kerosene, which is on fire. It can be extinguished with water spray alone. T F

22. Vapors from carbon tetrachloride are not poisonous. T F

16636

ANSWERS

Part I

Question Number	Answer
1	True
2	True
3	False

(In practically all cases the correct answer is "true." Under some circumstances, however, a concentrated spray or mist of heavy, high flash oil may be ignited at a temperature below the flash point of the oil. In principle, this is similar to the ignition of dusts, coal, wood, flour, etc.)

4	b
5	True
6	False
7	True
8	False

(As an example, a visible spark from a single flashlight battery cell has too low an energy content to ignite gasoline vapor. However, it may ignite other more easily ignitable fuel vapor, such as carbon bisulfide [a rodent-killing material], etc.)

9	True
10	False

(Sparks from shoe nails, like sparks from hand tools, have too small an energy content. In a tank truck accident, however, an overturned truck sliding over concrete pavement may produce higher energy sparks, which could ignite gasoline vapor.)

11	b
12	a
13	True
14	True
15	True
16	True

(This can be checked by filling a saucer with cleaning solvent and attempting to ignite it with a match. Gasoline ignites promptly, but cleaner's solvent does not. However, if the match flame is held near the surface of the solvent

16637

for a moment the radiant heat from the flame will heat a local surface area of the solvent above the approximately 105° F flash point, and the fuel will ignite.

(Other fuels with much higher flash points may be very difficult or impossible to ignite in the same manner. An example is lube oil.

(A large garment wet with cleaner's solvent and hung up to dry in a small closed service porch can form an explosive atmosphere when the air temperature is less than 100° F.)

17	True

Question Number	Answer
1	b
2	d

(The answers [c] for Questions 1 and 2 were added to stimulate discussion. There is no harm in using [c] as a precautionary measure, but it is not absolutely necessary and should not be done if the water supply must be conserved.)

3	b and d
4	d first and c second
5	b
6	False

(The gasoline vapor concentration in the atmosphere in the underground tank will be above its flammable limit, and hence the flame will not pass into the tank but simply will burn in the open above the fill opening.)

7	True
8	True

(That is, assuming the pump is located within the dispenser unit. This question and some others were included to stimulate good group discussion to cover variations of the particular problem.)

9	True
10	False
11	False
12	True

16638

(The rate of water added should be sufficient to maintain the water level above the leak but not so great as to overflow the tank.)

13	True
14	c
15	True
16	True
17	True

1955 Test

18	False
19	True
20	False
21	True
22	False

16639

PART 4 OIL FIRE TRAINING FILMS

16640

233

USING OIL FIRE FILMS

This part of the manual contains a list of available films and suggestions on how to gain the most value from their use. Films are used extensively in schools and universities. Students retain their lessons best if the subject matter is discussed and also illustrated.

TABLE 12
Retention of Subject Matter

Method of Instruction	Retained After 3 Hours	Retained After 3 Days
Lecture only	25-70%	10%
Film only	75%	20%
Film and discussion	80%	65%

Some instructors neglect to preview a film before the showing and to conduct a discussion afterward on the lessons to be learned from the film. They use the lazy method of letting the film do their job. With this method, the students retain only 20 percent of the subject matter after three days. If the proper instruction is used, they may retain 65 percent.

Techniques for Teaching with Films

Before the Meeting

1. Preview the film. Take notes outlining the film's content and main lessons. Do not use the film unless it illustrates the key points that you wish to put over. A short film on a specific subject has better training value than a long one of more general interest.

2. From your notes prepare an outline of the discussion to precede and follow the showing. If applicable, prepare a true-false test or other type of simple quiz for use after the discussion.

16641

ANGLE STEP W.S. 27.

NOTCHED SLIDE W.S. 28.

T. BLOCK W.S. 29.

SLOTTED WEDGE W.S. 30.

ILLUSTRATION SHEET 15

3. Select a properly darkened room with good ventilation. Arrange the seating to provide the best visibility and comfort. Eliminate or minimize distracting noises

During the Meeting

1. Explain to the firemen why you selected this particular film and what it is about.

2. Prepare them for what is coming. Tell them what key points to look for. Distribute note pads and pencils.

3. When applicable, tell them that you will pass out a quiz sheet after the film.

4. Show the picture.

5. After the showing, use your preview notes. Ask each man a question or two. Elicit discussion, particularly from the quiet ones. Cover the key points thoroughly.

6. If necessary and time permits, reshow the film to clear up any controversies or emphasize important points.

7. Pass out the quiz sheets.

8. Provide the answers and have the men grade and keep their copies.

After the Meeting

In your log book post the title and source of the film, its length in minutes, your appraisal of its value, your preview notes, and a copy of the quiz sheet, all for possible future use.

Available Training Films

The majority of the following 16 mm. motion pictures were taken from an NFPA listing. The code letters at the end of each description show the sources. The code key follows at the end of the listings. This is not a complete list of all films available, but it does contain most of the good films on oil fire control. Some suppliers of fire fighting equipment also have good training films--for example, the Ansul Chemical Co., which lends films on dry chemical extinguishers. In 1963 the National Foam System, Inc. (N-6), produced an excellent 21-minute film covering the development of foams for fighting large oil fires and demonstrating modern equipment and methods.

16642

Oil Fire Control Films

1. Fighting Tank Fires, 26 min., color, 1961. Actual fire company attack on oil tank fires; how to position crew, choose nozzle size, lay lines, move in. Loan, W-2. Buy, N-5, $165. (NFPA Flammable Liquids Engineer Miles Woodworth has also prepared a set of 36 colored 35-mm. slides and a script on the slides. The movie is excellent in itself, but its value is greatly enhanced by the supplementary use of the slides and commentary. If you borrow this film, we highly recommend that you purchase the slides and commentary booklet from NFPA for $15. Chiefs who have used both say the supplemental use of the slides increases retention four to five times the retention of information when the film is viewed alone.)

2. Oil Fire Protection Through Knowledge, 30 min., color, 1956. The chemistry of fire, sources of ignition, control, prevention through operation, maintenance, design, fire control, extinguishment, and training. Loan, S-4. Buy, S-4, $275.

3. The Chemistry of a Petroleum Fire, 32 min., color, 1962. Tabletop demonstrations of the characteristics of flammable liquid fires, safety measures. Loan, A-1. Buy, A-1, $140.

4. Fire Power, b&w, 1951. Tabletop demonstrations of the hazards created by gasoline vapors, showing methods for their control. Loan, E-2, S-5. Rent, U-11.

5. Analysis of a Bulk Plant Fire (Kansas City Bulk Plant Fire), 24 min., b&w, 1962. Dramatic tank explosion scenes, in a newsreel type of film but with new explanatory prologue (added in 1962) on conditions prior to the fire and an epilogue containing important suggestions relating to effective fire fighting procedures and personal safety to fire fighters. Loan, W-2, A-1. Buy, A-1, $45.

6. Heating Safely, 6 min., b&w, color, 1954. Safe ways to use portable oil heaters and stoves. Loan, N-2, W-2.

7. Kerosene the Killer, 17 min., b&w, 1953. The many hazards of kerosene and kerosene stoves. Loan, M-3.

8. Under Control, 17 min., color. Characteristics of volatile substances and the procedures for their safe handling. Loan, E-3.

9. A Pound of Prevention, 38 min., color. Step-by-step demonstration of safety procedures for tank truck operations. Loan, E-3.

16643

10. Pipeline on Wheels, 28 min., color, 1951. Safety factors in fuel tank truck operations from a driver's point of view. Safe construction of tank trucks and safe driving practices. Fire training ground scene involving full-sized tank truck fire. Loan, D-3, S-5.

11. Tank Truck Fires, 15 min., color, 1956. Instructional film on oil industry training methods. Training of drivers, handling of tank truck fires, use of dome covers and emergency valves. Fire extinguishment under the hood and at the dome as well as spill fires. Loading rack overflow fires using truck and plant extinguishers. Loan, A-5, S-2. Buy, A-5, $100; T-2, $97.

12. Farm Petroleum Safety, 28 min., b&w. Safe and unsafe ways of handling petroleum products. Rent, U-10, $1. Buy, A-1, C-7, $127.50.

13. Safe Every Second, 22 min., color. Need for constant alertness in gasoline service station operations. Loan, S-4.

14. Water Fog--Master of Fire, 37 min., color. How water fog controls flammable liquid fires. Also Class A fires. Principle and operation of equipment. Good film for industrial plants, refineries, fire departments. Loan, R-3. Buy, R-3, $250.

15. Let's Try Fog, 18 min., color, 1955. Actual tests of fires in oil pits, tank truck oil storage tank, rubber tires, and small arms ammunition. Demonstrations of application of wetting agent from special nozzles, master devices, fixed foam chambers, and use of plain water. Loan, W-2. Buy, S-6, $97.50.

16. Fog Techniques, 20 min., silent and titled, color. A fire training film showing an actual oil well fire and its shut-in and extinguishment by trained men applying the water fog technique. It also shows the drill ground training with fog that these men received. Loan, U-1. Buy, A-1, $70.

17. Fire on Signal Hill, 30 min., sound, color. Portrays two days of fire fighting experiences gained during the largest refinery fire on the West Coast. Emphasizes prefire planning, mutual aid, and communication. Stresses important lessons learned in design and fire fighting, etc. Includes some of the finest oil fire fighting film ever taken under major fire conditions. Loan, E-2. (See also film No. 23.)

18. Petroleum Fires, color. Characteristics of petroleum fires. Methods of prevention and control. Equipment and techniques for extinguishing various types of petroleum fires. Loan, T-1. Buy, N-5, $125.

16644

19. LP Gas Fire Control, 11 min., sound, color, 1959. On-the-scene graphic report showing how preplanning helped one fire department do an outstanding job in handling an LP gas tank truck fire. Produced for the NFPA Gases Field Service. Loan, L-3, W-3. Buy, N-5, $75.

20. Safe Handling of Light Ends, 20 min., color, 1962. Fire prevention in pumping, handling, storage, and transportation of LP gas products. Good fire action scenes in proper cooling of flaming tank truck. Loan, D-3. WLGA (Code W-3) recommends their 35-mm. strip film of 32 frames using clip shots taken from the above movie, with a supplementary Leader's Manual for the instructor. Loan, W-3.

21. Respect, 35-mm. strip film with a record. Plant owner shows new employee through the plant, properties, describing properties of LP gas, delivery, safe truck handling, tank installations at various destinations, and how excess and relief valves work. Loan W-3, P-1.

22. Emergency Control of Natural Gas, 30 min., color. Various control procedures for emergencies involving natural gas. City distribution of gas, physical properties, areas of hazard, actual fire scenes. Based upon operating procedures of a Los Angeles Gas Company. Loan, A-2. Buy, C-2, $187.50.

Films of Related Interest

23. Danger Water, 30 min., sound, color. Dangers of accidental introduction of water into hot oil systems--animation, tabletop demonstrations, and actual case histories. A good companion picture to film No. 17. Loan, E-2.

24. Danger Air, 35 min., sound, color. Explosions and detonations in processing equipment. Fire prevention measures. Loan, E-2.

25. School for Fire Fighters, 30 min., b&w. Hose connections, the proper way to roll hose, and proper use of fire fighting tools to control various types of fire in flammable liquids and ordinary combustibles. Loan, R-3.

26. Using Water Wisely, 23 min., sound, color. Indirect fog application of test fires on small structures where water quantities used were recorded. Application to confined fires in oil installations. Booster and 1-1/2-in. lines are covered. Loan, T-3.

27. Master Spray Stream Problems, 20 min., sound, color. Large spray nozzles used on heavy stream units, deluge sets, deck guns, and ladder

16645

pipes and multiple hose lines from 1000 gpm or larger pumpers. Loan, T-3.

28. Fog Against Fire, 20 min., sound, color. Proper fog patterns, nozzle sizes on fires larger than those covered in film No. 27. Fog curtains for exposure protection and master spray streams. Loan, T-3.

Films of Historical Interest

The following films relate to Section 4 of Part III.

29. Fighting Petroleum Fires, 45 min., silent, b&w. This rare film, made about 1935 and sometimes called the "Chicago Fire School Film," was used by the "West Coast faculty" at the May, 1943, fire school in Chicago. It is probably the first training film relating specifically to flammable liquid fires. It covers tabletop demonstrations, a discussion of static, extinguishing techniques of the time (including the handling of large tank fires), etc. Except for the classroom part, which is good today, the remainder is of historical interest only. This film is not available for general loan. It is owned by Western Oil and Gas Association.

30. Oil Fires and Their Extinguishment, 45 min., sound, b&w. Same as the preceding film No. 29 except that it has a sound track, added about 1941, and a new title. Many years ago it was available for loan from the Ethyl Corporation. The Western Oil and Gas Association has a print.

31. Chemistry of Fire, World War II Navy Fire Fighters School training film in two parts. Some of the material is similar to parts of films No. 29 and 30. Although this film shows older techniques of extinguishment, the tabletop demonstrations deserve review. Part I, 32 min., sound, b&w. Good tabletop demonstrations of flammable liquids, other oils, and combustibles, as found aboard ships. (Data quoted on ignition temperatures are in error. See Part I of this manual on the subject.) Part II, 15 min., sound, b&w. Tabletop demonstrations of ship and shore-side extinguishing techniques. Steam smothering, CO_2, foam, and water fog. Loan, T-3.

32. 1941 Bakersfield Oil Fire Control School, silent, color. Scenes from the first fire school in Bakersfield. This rare film is of historical interest only. It is not available for loan but may be seen by appointment. It is owned by the Kern County Fire Department.

33. 1955 Bakersfield Oil Fire Control School, silent, color. Film record of the demonstration and participation drills at the 1955 school. Film is kept in Thomas S. Ward's office (T-3).

Insofar as known there is no film on the 1961 Bakersfield Oil Fire Control School.

ABSTRACT - Developed by the Iowa Department of Public Instruction with the cooperation of educational personnel, this curriculum guide is designed for the instructor's use in planning industrial arts programs and activities. A definition, philosophy, and specific objectives for industrial arts are stated. Other units considered in the first part of this document include: (1) Requisites of Quality Industrial Arts, (2) Scope and Sequence of Industrial Arts Programs, (3) Selected Aspects of Organization and Administration, (4) Purposeful Teaching, (5) Measurement of Student Achievement, and (6) Useful Information for the Teacher as a Professional. The Second Part contains background information, learning activities, selected instructional aids or sources, equipment, and supplies of tools and equipment for eight specific areas of industrial arts. ACKNOWLEDGMENTS

Grateful acknowledgment is expressed to the persons listed below who gave so freely of their time and efforts in the production of this publication.

Duane Abbott, Industrial Arts Instructor, Exira Community Schools, Exira, Iowa

Leonard Bengtson, Director, Student Personnel Services, Des Moines Area Community College, Ankeny, Iowa

John Fields, Superintendent, Muscatine Community Schools, Muscatine, Iowa

Robert George, Industrial Arts Instructor, Anamosa Community Schools, Anamosa, Iowa

Charles Havener, T and I Coordinator and Industrial Arts Supervisor, Ames Community Schools, Ames, Iowa

Herbert Lang, Industrial Arts Instructor, Ayrshire Consolidated Schools, Ayrshire, Iowa

Darrell Moore, Registrar, Scott Campus of Eastern Iowa Community College, Davenport, Iowa. (Formerly, Industrial Arts Consultant, Department of Public Instruction.)

Donald Simmons, Consultant, Civil Defense Education, Department of Public Instruction, Des Moines, Iowa. (Formerly, Industrial Arts Instructor, Lincoln High School, Des Moines.)

Lawrence Wright, Professor and Director of the Graduate Major in Industrial Education, Stout State University, Menomonie, Wisconsin. (Formerly, Professor of Industrial Arts, University of Northern Iowa.)

Construction Technology

Gary Weede, Assistant Professor of Industrial Education, Iowa State University, Ames, Iowa

Drafting

Ronald Bro, Assistant Professor of Industrial Arts, University of Northern Iowa, Cedar Falls, Iowa

Electricity-Electronics

Mahlon Hill, Industrial Arts Instructor, Kennedy High School, Cedar Rapids, Iowa

Graphic Arts

Russell Hansen, Associate Professor of Industrial Arts, University of Northern Iowa, Cedar Falls, Iowa

Metals

Allen Suby, Industrial Arts Instructor, Belmond Community Schools, Belmond, Iowa

Plastics

Gary Weede, Assistant Professor of Industrial Education, Iowa State University, Ames, Iowa

Power (Power Mechanics, Auto Mechanics)

Walter Diedrick, Assistant Professor of Industrial Education, Iowa State University, Ames, Iowa

Wood

Jerrold Swenson, Industrial Arts Instructor, Storm Lake Community Schools, Storm Lake, Iowa

Sincere appreciation is extended to the State Committee on Industrial Arts Teacher Education and others who have contributed material or given of their time and effort to review portions of this publication and offer suggestions.

FOREWORD

Industrial arts is in transition. Moving from the earlier programs where only two or three instructional areas were taught, the industrial arts offerings must now provide for more areas and more technical instruction in these areas if industrial arts is to be representative of the vast technology of our ever-expanding industrial environment.

Iowa is an important part of this industrial environment. Although many people think of Iowa as primarily an agricultural state, few are aware that Iowa's industrial output of $2.5 billion in 1950 surpassed that of agriculture. Industrial output in Iowa has continued to grow, exceeding $10 billion in 1968 compared to an agricultural output of $3.3 billion.

In today's rapidly changing world, it is not enough that the industrial arts teacher be knowledgeable only in his field. He must become a perennial student of social and economic change and should sense change through personal contacts with industry, business, and education in his own community.

The Department of Public Instruction recognizes the importance of industrial arts as a part of the total curriculum. Administrators and school boards are urged to give serious consideration to incorporating a modern program of industrial arts in their school curriculum.

PAUL F. JOHNSTON
State Superintendent of Public Instruction

16652

PURPOSE

The purpose of this guide is to help those responsible for curriculum planning to develop and implement a modern program of industrial arts. This guide has been developed by experienced industrial arts educators. Every school system should find it a practical instrument for the improvement of instruction in industrial arts.

School administrators should find the information in the first portion of this guide helpful in keeping abreast of current developments in this important curriculum area. Industrial arts teachers should find this publication to be of particular value in developing sound programs and well-organized courses.

Our increasingly technological society has focused attention on the importance of industrial arts as a curriculum area. At the same time, industrial arts is being challenged to expand and clarify its function. Therefore, re-evaluation of current emphasis in industrial arts is essential.

A modern industrial arts curriculum should reflect current trends in technology. Traditional practices in familiar areas such as drafting, metals, and woodworking should respond to innovations by various changes in emphasis. Less familiar areas such as electricity-electronics, graphic arts, plastics, and power mechanics should receive increased attention as the impact of atomic energy, automation, and space research is revealed and understood.

It is hoped that all who are responsible for programs of industrial arts will be aided by this publication as they plan new industrial arts programs or revise existing programs to meet the needs of the youth of Iowa.

I DEFINITION OF INDUSTRIAL ARTS

Industrial arts is that portion of general education devoted to understanding and solving the technical and human problems brought about by the industrialization and technological advancement of our society. It is especially concerned with technical communication (sketching, drafting, technical writing, and methods of reproduction including the graphic arts), research and development (improvements and inventions), production (manufacturing), and consumption (product selection, use, care, and maintenance).

Industrial arts is a categorical heading for subject matter of its own kind. Just as mathematics includes such content as arithmetic, algebra, geometry, and trigonometry; industrial arts includes such content as construction technology, drafting, electricity-electronics, graphic arts, industrial plastics, metal, power, and wood.

Preparation of students for employment is not a specific purpose of industrial arts; however, many students of upper level high school courses in this curriculum area are found to possess the type of attitudes, knowledge, and skills sought by employers.

Industrial arts may be used to enrich elementary education. Appropriate industrial arts course work should be taught to all boys and some girls in junior high school not later than eighth grade, and continued through the senior high school. Industrial arts, taught as an exploratory program, should give students the opportunity to identify their interests and aptitudes before they make decisions which commit them to a definite occupational or educational goal.

Industrial arts provides a means by which the student can apply in practical and meaningful situations the theoretical principles of science, mathematics, social studies, and other related subjects.

Industrial arts is often confused with industrial education, vocational-industrial education, and technical education, but it is not the same as any of these. Industrial education is the generic term used to include several *different* educational programs dealing with various aspects of industry. Industrial arts is closely related to vocational-industrial education and may make important contributions as a pre-vocational activity. However, it must not be confused with vocational or trade training. Its objectives are those of general education, and instruction in industrial arts should be valuable to any person regardless of his vocational choice. The following chart sets forth the similarities as well as the differences between the aforementioned types of industrial education.

16658

A COMPARISON OF INDUSTRIAL ARTS, VOCATIONAL-INDUSTRIAL EDUCATION, AND TECHNICAL EDUCATION*

Industrial Education			
	Industrial Arts	**Vocational-Industrial Education**	**Technical Education**
Type of Training	General exploratory education of industrial processes	Specialized training in a trade skill	Extensive knowledge of a field of specialization
Grade Levels	Grades 1 - 12	High school or post high school	Post high school
Hours per Week	1 - 10 hours per week	Minimum of 15 hours per week	Unspecified
Time and Location	Classes during regular school day on school grounds	During school day, class may or may not be on high school grounds	Classes day and night, on post-high school campus
Curriculum	Introduction to our nation's industry through courses in construction technology, drafting, electricity-electronics, graphic arts, industrial plastics, metal, power, and wood	Subjects vary with needs of community	Mathematical, scientific, and engineering processes that are related to the field
Teacher Preparation	College graduate	Skilled tradesman, need not be a college graduate	College graduate or technical institute graduate, plus appropriate experience
Job Placement	No effort for job placement	Student placed and followed	Students placed and followed, or may be oriented toward higher education
Equipment Necessary	Modern tools and equipment essential	Modern production equipment essential	Modern industrial equipment together with testing devices and specialized instruments.
Federal Aid	Some federal aid available under certain conditions	Federal aid	Federal aid

166659

II PHILOSOPHY OF INDUSTRIAL ARTS

The important place of industry in our society of today and its probable importance in the future demand that all members of our society have some understanding of the industrial world. In such a society each of us is dependent upon others in providing for his needs and it is important that the worth of each individual be valued, whether he be a tradesman, a production worker operating a machine in a large factory, a foreman, a draftsman, an engineer, or an executive. The contribution industrial arts can make here is unique in that understandings of work and appreciations of individuals become meaningful through first-hand experiences with the tools, materials, and processes of industry in a shop situation as well as in activities such as lecture-discussion and textbook assignments normally found in a classroom situation. Although various occupations require differing kinds and amounts of education, it is important for our youth to realize that it is honorable to work for a living regardless of their level of educational attainment. Our type of industrial society cannot survive by preparing well only those in the professions.

A good industrial arts program should be available for all boys and some girls. At the elementary level, it is usually integrated with the common core of elementary school subjects, frequently drawing content from historical events, geographical phenomena, and everyday life experiences. Major provisions for formal industrial arts at this level are not developed in Iowa to any appreciable degree at this time. At the junior high level, significant segments of industry become more clearly defined so that the general education objectives may be more readily attained. Fundamental practices in a variety of industrial pursuits should be evident at this level. Senior high school industrial arts should provide opportunities for more individual selectivity of content, with provision for greater specialization in the respective areas.

Properly presented, industrial arts has attributes which challenge students of all levels and interests. It embodies the content, and exhibits the practices, which fulfill the needs of students with varied educational objectives, from those who will enter employment immediately upon graduation to those who will continue education through apprenticeship programs, technical institutes, or four-year colleges or universities. It should not be forgotten that industrial arts courses are rich in opportunity for the development of interests which lead to worthwhile avocations.

A significant criterion for continued growth of industrial arts as a curriculum area is that it should reflect modern industry with some degree of accuracy and that instruction should capitalize on the use of problem-solving principles and increased application of science and mathematics.

16660

The accelerated rate in scientific and technological developments requires tremendous effort to reduce the educational lag.

The objectives for industrial arts must be carefully developed so that the efforts of those responsible for such instruction will be focused on meeting the determined needs of youth. The five objectives* listed below are believed to be unique to industrial arts and should be emphasized in the schools of Iowa.

Girls should have an opportunity to explore the various areas in shop.

III OBJECTIVES

1. **Develop an insight and understanding of industry and its place in our culture.** Industry is such a dominant element in our society that no individual in this country can claim to be an educated person unless he has some understanding of our industrial society and himself as a part of it. Industrial arts contributes to this understanding in a very effective manner because students are provided first-hand experiences with tools, materials, and problems of modern industry.

2. **Discover and develop talents, aptitudes, interests, and potentialities of students for the technical fields and applied sciences.** Students have a diversity of talents. The school's responsibility is to assist students in discovering and developing their talents. It is the responsibility of industrial arts education to identify special talents in industrial-technical fields.

3. **Develop an understanding of industrial processes and the practical application of scientific principles.**
   Industrial arts provides opportunities for the practical application of scientific and mathematical principles to the solution of technical problems. Students encounter such problems as they complete exercises, experiments, and projects that involve industrial processes.

4. **Develop basic skill in the proper use of common industrial tools, machines, and processes.**
   Even though it appears that training and retraining (perhaps for several different occupations) will be necessary for workers of the future, well-developed manipulative skills in using common industrial tools and machines should do much to facilitate such retraining. Manipulative skills have always been an important part of industrial arts, and this important learning-by-doing should not be lost. But manipulative skills should be kept in proper perspective as the vehicle students use to achieve their goals rather than the end or goal of industrial arts instruction. As course work becomes more technical, emphasis and time directed to developing manipulative skills should be reduced somewhat so that theoretical material can be presented effectively.

5. **Develop problem-solving and creative abilities involving the materials, processes, and products of industry.**
   The industrial arts shop is an especially useful setting for promoting creative thinking and providing opportunities for students to define problems, work out logical solutions to those problems, and evaluate the effectiveness of their solutions. Traditional programs of industrial arts have seldom realized their full potential for fostering problem-solving abilities and creativity, but flexibility in methodology and keeping content up to date will do much to provide students with the type of experiences they need in this area.

These objectives are considered basic for all industrial arts. Supplementary objectives should be developed for elementary school, junior high school, and senior high school, and for adult programs, as well as special programs for students with special needs.

*Adapted from *A Guide To Improving Instruction in Industrial Arts,* American Vocational Association, August 1968.

16662

IV REQUISITES OF QUALITY INDUSTRIAL ARTS

A Well-prepared and Enthusiastic Teacher

A well-prepared industrial arts teacher who is enthusiastic about his job is the most important of a number of aspects that must be considered if the curriculum area of industrial arts is to make the type of contribution it should make to the education of the youth in a school system. Such a teacher can do much despite inadequate facilities and equipment, but he should not be handicapped this way.

It is difficult to develop a well-balanced industrial arts program where teacher turnover takes place every year or two. School systems that are plagued with turnover problems should make every effort to solve these problems, for changes in teaching personnel often place a good program in jeopardy. Administrators should be sufficiently familiar with the industrial arts programs being offered in their schools that they will seek to employ not just any certificated industrial arts teacher but one who is qualified, by preparation and experience, to teach the type of program that should be taught.

A Well-planned Program

The purposes and objectives of industrial arts should be clearly defined and thoroughly understood before attempting to plan the expansion of existing programs or the development of new ones. Subject-matter areas and courses must then be identified. Experiences that are desirable and educationally significant must be ascertained before tools and equipment needs can be determined. Permitting equipment to determine the curriculum is educationally unsound.

Important steps in program planning, not necessarily in the exact order given, are:

- Predicting enrollment
- Planning size and number of classes
- Visiting other school industrial arts programs
- Securing consultative services (Department of Public Instruction and field services of Iowa State University and University of Northern Iowa)
- Determining type of program
- Estimating available funds
- Deciding principal shop areas

16663

Facilities Appropriate to the Program

An effective program of industrial arts is dependent upon well-planned physical facilities. Wise planning pays dividends in constructing new facilities, remodeling existing facilities, or rearranging the layout in existing industrial arts shops to facilitate a curriculum revision. Experience has shown that poor initial planning usually results in long-lasting ill effects on the program. Once a building is constructed, changes are difficult to achieve.

Administrator - teacher planning for program and equipment.

Space in this publication will not permit providing specific recommendations for facilities. Those responsible for planning facilities are urged to:

1. Visit school shops that are reputed to have fine facilities.

2. Study materials which deal with specific aspects of shop planning. Some of the following may be helpful:

   - *Planning and Designing Functional Facilities for Industrial Arts Education,* Publication OE-5105, Marshall L. Schmitt and James L. Taylor, U.S. Dept. of Health, Education, and Welfare, Office of Education, 1968.

     Order from:
     U.S. Government Printing Office
     Washington, D.C. 20402
     Price 45c.

   - *Modern School Shop Planning,* Fifth edition, Prakken Publications, Inc., Ann Arbor, Michigan, 1967. Cost approximately $4.

   - *Planning Industrial Arts Shops (for Secondary Schools),* Educational Service Publication No. 31, Willis H. Wagner, Dept. of Industrial Arts and Technology, University of Northern Iowa, 1966.

     Order from:
     Extension Service
     University of Northern Iowa
     Cedar Falls, Iowa 50613
     Single copy $1, payment to accompany order.

   - *Planning Industrial Arts Facilities,* Eighth Yearbook, American Council on Industrial Arts Teacher Education, 1959, McKnight and McKnight Publishing Company, Bloomington, Illinois 61701.
     List price $6.60 — School price $4.95.

   - *A Guide for Planning Specialized Departments for High Schools in Iowa,* Industrial Arts, Bulletin 127.3, Lowell L. Carver, Dept. of Industrial Education, Iowa State University, Ames, Iowa, 1956.

     Order from:
     Engineering Extension
     Iowa State University
     Ames, Iowa 50010

   - The annual March issue of *Industrial Arts and Vocational Education* focuses on shop planning.

3. Prepare preliminary specifications for physical facilities.

4. Consult with qualified persons as necessary. Services of consultants to assist in planning

16664

industrial arts facilities may be secured through:

- Dr. Raymond Schlicher
  Director of Field Services
  University of Northern Iowa
  Cedar Falls, Iowa 50613

- Dr. Marvin Anderson
  Dean of Extension Division
  Iowa State University
  Ames, Iowa 50010

5. Make final plans for physical facilities. It is most important that this phase of the work be the responsibility of local personnel. The following may be useful as a check list:
   - Size, shape, and location of industrial arts facility to accommodate program
   - Type of shop (unit or comprehensive)
   - Walls, floors, and ceilings
   - Windows and doors
   - Illumination and painting
   - Equipment
   - Storage space
   - Sinks and fountains
   - Safety and health
   - Heating and ventilation
   - Water, gas, and electricity
   - Auxiliary rooms and areas
   - Entrances and exits

Equipment Adequate to Instructional Needs

Serious errors may be made in purchasing industrial arts equipment, including machinery and tools, unless the following are considered:

- Objectives of the program
- Course offerings (scope and sequence)
- Age and grade level of student
- Present and future needs
- Design, quality, and safety features of the tools and equipment
- Budget — initial, annual

Note: The annual April issue of *School Shop* contains a suppliers directory which may be helpful.

Appropriate Attention to Safety

Industrial arts teachers, administrators, and school districts have a legal responsibility to provide and maintain a safe environment in which industrial arts activities may be conducted safely and under healthful conditions.

Safe Environment. Aspects which must be considered in developing a safe environment are:

- **Physical facilities.** Such factors as lighting, ventilation, condition of floors, placement of machines, storage, disposal of waste, adequate dust collection and exhaust systems, and many others must be considered when setting up a shop which will promote safety.

- **Machines.** The degree of hazard involved in the operation of different machines varies greatly. It is important that safety devices, guards, and shields designed for a specific piece of equipment be secured when the machine is purchased. Furthermore, teachers must be careful to abide by the safety instruction they present to students for if students observe a teacher using a hazardous machine with the guard removed, they may follow the teacher's example rather than his instructions. Industrial arts teachers should require students to pass a safety test on each piece of machinery or each portable power tool before they give permission to use such equipment. These tests should be kept on file for whatever value they might have as evidence in litigation resulting from an accident.

- **Tools.** Seldom are hand tools thought of as being particularly hazardous. However, all edge tools and tools such as hammers that might have loose heads are potentially dangerous. Close attention should be given to maintaining such tools in proper condition. High quality tools are generally the safest, require least maintenance, and are less expensive in the long run.

- **Procedures.** If the teacher fails to adequately instruct a pupil on the correct procedure for using a hazardous machine or tool, or if he fails to warn of the dangers that may arise if safety rules are disobeyed, or if the use of safety devices is ignored, or if personal protective equipment is not worn, then the teacher has omitted a specific legal duty and would be liable for negligence in event of an accident.

Safety Consciousness. All facets of the industrial arts program, including the physical facilities, tools and equipment, the instructional program, and supervised activity, must contribute to the development of a safety consciousness or attitude to govern the daily habits of students in the shop. Accident prevention should be taught as an integral part of all courses. It should be so well integrated into instruction that it loses its identity as a separate concept. The attitude of the teacher and the example he sets will have a significant effect upon the type of attitudes developed by students.

16665

Eye protection is mandatory.

Literature Pertaining to Safety. Considerable literature pertaining to school shop safety is available. It is suggested that those seeking more detailed information on this important subject start their search with the following:

- *Accident Prevention Manual for Shop Teachers,* William A. Williams, Editor. A professional publication of the National Association of Industrial Teacher Educators, American Technical Society, Chicago, Illinois, 1963. List price $7.50 — school price $6.
- *Education for Safety Through the School Shop.* A publication of the Accident Prevention Department, Association of Casualty and Surety Companies, New York, and the Center for Safety Education, Division of General Education, New York University, 1952.
- *Safety Rules for the Safe Operation of Power Woodworking Tools,* Frank Paxton Lumber Company, Box 683, Des Moines, Iowa 50303. 10c.

Eye Safety. On May 14, 1965, Governor Harold Hughes signed into law the eye protection legislation now included in Section 280.20, *Code of Iowa:*

Eye Protective Devices. Every student and teacher in any public school participating in any of the following courses:

1. Vocational or industrial arts shops or laboratories involving experience with any of the following:

   a. Hot molten metals;

   b. Milling, sawing, turning, shaping, cutting, grinding, or stamping of any solid materials;

   c. Heat treatment, tempering, or kiln firing of any metal or other materials;

   d. Gas or electric welding;

   e. Repair or servicing of any vehicle while in the shop;

   f. Caustic or explosive materials;

2. Chemical or combined chemical-physical laboratories involving caustic or explosive chemicals or hot liquids or solids when risk is involved; is required to wear industrial quality eye protective devices at all times while participating in any phase or activity of such course which may subject the student or teacher to the risk or hazard of eye injury from the materials or processes used in said courses. It shall be the duty of the teacher or other person supervising the students in said courses to see that the above requirements are complied with. Any student failing to comply with such requirements may be temporarily suspended from participation in said course and the registration of a student for such course may be cancelled for willful, flagrant or repeated failure to observe the above requirements. The board of education having jurisdiction of any school coming within the purview of this Act shall provide the safety devices required herein. Such devices may be paid for from the general fund but the board may require students and teachers to pay for said devices and shall make them available to students and teachers at no more than the actual cost to the district.

"Industrial quality eye protective devices," as used in this section, means devices meeting the standards of the American Standards Association Safety Code for Head, Eye, and Respiratory Protection, Z2.1-1959, promulgated by the American Standards Association, Inc.

Selection of eye protective devices should be according to the law. Such equipment will be adequate only if it can withstand certain tests such as impact, heat deformation, water absorption, and flammability. Other important factors would be high optical standards, comfortable fit, good workmanship, and interchangeability of parts. Buyers should insist that eye protective devices be guaranteed to meet the American Standards Safety Code 22.1-1959 mentioned above. Suppliers are eager to assist and should be contacted for information, demonstration, and price lists. Examples of literature that would be helpful in this regard are:

- *How To Install a School Eye Protection Program,* Fend-all Company, 2222 Diversey Parkway, Chicago, Illinois 60647.

16666

- *Establish an Effective School Eye Safety Program,* Sellstrom Manufacturing Co., 275 South Hicks Road, Palatine, Illinois 60067.

A proper program of hygiene should be carried on in each shop to minimize contagion and maintain cleanliness. Spectacle-type eye protectors generally are thought of as personal items and should be assigned permanently to the individual wearer whenever possible. Spectacles used by more than one person should be sanitized in a cabinet equipped with an ultraviolet germicidal lamp or by immersing in a cleaner-sanitizer solution. Equipment such as welding helmets should be treated in a similar manner.

Schools vary in their policies regarding the financing of eye protective equipment. Some schools assume the expenditure for eye protection and assign them to pupils and teachers at no cost. Others purchase them and resell them to recover their investment. Students who must wear prescription glasses generally assume their cost with the school making necessary arrangements for their acquisition. Certain local civic organizations have been known to assist such students to help alleviate cases of financial hardship.

Proper Emphasis on Evaluation

Evaluation is primarily a diagnosis resulting from objective and subjective data which constitute the basis for accurate judgments. Its overall purpose in education is to improve the work of the school.

Evaluation is not a one-time endeavor. To be effective it must be a continuing function.

Areas to be considered are:

- The program
- The facilities
- The teacher
- The student
- The administration

Checklists are available for evaluating the industrial arts area. Some are given below:

- Booklet: *AVA Evaluative Criteria for Industrial Arts Education,* Industrial Arts Education Division, American Vocational Association, Inc., 1010 Vermont Avenue, N.W., Washington, D.C., 1961.
- Booklet: *Upgrading the Industrial Arts Program,* Norman C. Pendered, College Science Publishers, Box 798, State College, University Park, Pennsylvania 16801, 1959, $1.
- Sheet: *Evaluation of Industrial Arts Programs,* Dept. of Education, State of Missouri, Vocational Division, Industrial Education, Jefferson City, Missouri 65101.

Appropriate Attention to Guidance

An effective program of industrial arts will make a substantial contribution to the guidance function served by the school. Experiences gained in industrial arts and talking with an industrial arts teacher who strives to accept responsibility in this area can assist the student in making wise choices, decisions, and adjustments as he moves toward maturity. The services designed to meet guidance needs of students enrolled in industrial arts may be classified as appraisal, information, counseling, placement, and follow-up.

Appraisal Service. The appraisal service should be designed to provide essential information concerning each individual pupil which will assist pupils to see themselves as they really are. The informal atmosphere of an industrial arts shop may be particularly helpful in providing students with the type of information about themselves that is not revealed in the more formal classroom situations.

Information Service. The rapid growth of technology has provided environmental forces, unknown a few years ago, which must be considered in making choices and decisions that will not be jeopardized by an uncertain future. Such decisions will be dependent to a great extent upon the amount and accuracy of information concerning present and future opportunities for each student.

The training, experience, and interests of the industrial arts teacher should enable him to provide such information which would be especially helpful for those interested in technical fields and applied sciences.

Counseling Service. Counseling represents that part of the guidance program where pupils should be helped to make major decisions. It is the most crucial service in the entire guidance program and unless it is carried out in a skillful manner, all other guidance services lose their reason for existing. The involvement of most industrial arts teach-

16667

ers in counseling may be limited to the identification and referral of students to the professionally-trained and certified counselor; however, industrial arts teachers with proper backgrounds can be unusually effective in counseling with students.

Placement Service. Assisting students in securing appropriate employment or in selecting suitable educational programs is an important aspect of guidance. Few industrial arts teachers are actively engaged in formal or well-organized programs of placement, but they are often contacted by employers and teachers of higher levels of education for their personal assessment of former students.

Follow-up. The follow-up on students is a large task and requires the coordinated efforts of many persons. If the school has an organized follow-up service, the industrial arts teacher's special training, experience, and contact with the student and employer may be very helpful in the assessment and interpretation of follow-up information collected regarding students formerly enrolled in industrial arts programs.

Conclusion. The guidance functions presented here are not intended to add to the industrial arts teacher's load. The degree in which the industrial arts teacher understands the purpose and function of guidance services and the degree to which he sees a need to know and understand pupils play an important part in determining the extent to which he will accept responsibilities in this area.

Appropriate Effort Devoted to Public Relations

Interpreting the industrial arts program to the school and community is an important responsibility of the teacher. The public relations program is a two-way process in which the flow of ideas from the public to the school is as vital as the school communicating with the public. The environment in which the industrial arts program will function is dependent upon a well-informed and receptive community. The industrial arts shop can be made one of the show places of the school.

To be effective, public relations must be:

- Comprehensive
- Honest
- Frank
- Simple
- Direct
- Continuous

Following are some techniques that may be useful:

- Involve the student as a means of communication from school to home and vice versa
- Exhibits
- News media (newspapers, radio, television)
- Assemblies
- Contests
- Open houses
- Awards

Helpful information regarding public relations may be found in the following articles:

- "Public Relations: Whose Responsibility?" L. S. Wright, *Industrial Arts Teacher,* 22:11, September 1962.

- "Improving Industrial Arts Through Public Relations," B. Dennison, *Industrial Arts and Vocational Education,* 57:40-41, June 1968.

16668

V

SCOPE AND SEQUENCE OF INDUSTRIAL ARTS PROGRAMS

The degree to which students might be involved in industrial arts, the types of course work in which they could participate at different levels, and the contributions industrial arts might make to their educational or vocational goals are considered in the following materials:

Student Flow

K-6th	Construction activities integrated with science, mathematics, English, and social studies as opportunities arise.			
7th	Required for all boys—(may include girls)	1 period daily for 18 weeks	2 Areas: 1 and 2, or with additional time include 6 and 7	1. Metal 2. Wood 3. Drafting 4. Electricity-Electronics
8th	Required for all boys — (may include girls)	1 period daily for 18 weeks	2 Areas: 3 and 4, or with additional time include 5	5. Power Mechanics 6. Industrial Plastics 7. Graphic Arts
9th	Required or elective boys or girls	1 period daily for 36 weeks	Advanced instruction in at least 3 areas including drafting. Select at least two others from 1, 2, 4, 5, 6, or 7 **NOTE:** In the absence of organized programs in grades 7 and 8, devote approximately equal time to areas 1, 2, 3, 4, or select from alternate plans shown on page 14	
10th 11th 12th	Elective boys or girls	At least 5 periods per week for each course in which student is enrolled	At least 2 *sequential* years of course work should be available in at least 3 of the areas listed. The first year of work in areas marked * should build on course work offered at previous levels	1. Construction Technology *2. Drafting *3. Electricity—Electronics *4. Graphic Arts *5. Industrial Plastics *6. Metal *7. Power *8. Wood

Post Secondary School Goals
College or University

Recommended Minimum Program for Industrial Arts in Iowa*

It is strongly recommended that industrial arts be included as a significant curriculum area in the comprehensive secondary school program of education.

SEVENTH GRADE

MINIMUM PROGRAM — 18 weeks (90 periods)	ENRICHED PROGRAM — 36 weeks (180 periods)
Areas recommended: Metal (suggested content, pp. 126-33) Wood (suggested content, pp. 164-66)	Areas recommended: Metal Wood Graphic Arts (suggested content, pp. 104-07) Industrial Plastics (suggested content, pp. 115-20)
Approximately equal amounts of time should be devoted to metal and wood.	Approximately equal amounts of time should be devoted to metal, wood, graphic arts, and industrial plastics.

NOTE: If industrial arts is offered only in the eighth (or seventh) grade, it should consist of 36 weeks and 180 periods and should include four areas, drafting, electricity, metal, and wood, with approximately equal amounts of time devoted to each.

EIGHTH GRADE

MINIMUM PROGRAM — 18 weeks (90 periods)	ENRICHED PROGRAM — 36 weeks (180 periods)
Areas recommended: Drafting (suggested content, pp. 71-74) Electricity-Electronics (suggested content, pp. 85-87)	Areas recommended: Drafting Electricity-Electronics Power Mechanics (suggested content, pp. 146-51)
Approximately equal amounts of time should be devoted to drafting and electricity-electronics.	Approximately equal amounts of time should be devoted to drafting, electricity-electronics and power mechanics.

*Adapted from Program proposed by the State Committee on Industrial Arts Teacher Education in cooperation with the Iowa Department of Public Instruction, January 1963, revised October 1966.

NINTH GRADE

In a sequential program in grades seven through nine, it is recommended that each pupil receive advanced instruction in at least three areas and that drafting be one of the areas with the remaining two selected from those listed below. Note: 36 weeks (180 periods).

Electricity-Electronics
Graphic Arts
Industrial Plastics
Metal
Power Mechanics
Wood

NOTE: In the absence of an organized program of industrial arts in grades seven and eight, exploratory opportunities should be provided patterned after one of the following plans:

Four Areas 9 weeks each of:	Five Areas 7 weeks each of:	Six Areas 6 weeks each of:	Seven Areas 5 weeks each of:
Metal	Metal	Metal	Metal
Wood	Wood	Wood	Wood
Drafting	Drafting	Drafting	Drafting
Electricity-Electronics	Electricity-Electronics and *1* of:	Electricity-Electronics and *2* of:	Electricity-Electronics
	Power Mechanics	Power Mechanics	Power Mechanics
	Graphic Arts	Graphic Arts	Graphic Arts
	Industrial Plastics	Industrial Plastics	Industrial Plastics

TENTH, ELEVENTH, AND TWELFTH GRADES

At the senior high school level, industrial arts should be available five periods per week. Instruction should be so designed that the pupil can take two years of sequential course work in at least three of the following areas:

Construction Technology (carpentry, concrete, masonry)
Drafting (general, machine, engineering, technical, architectural)
Electricity-Electronics (appliance repair, house wiring, motor maintenance, radio, television, industrial electronics)
Graphic Arts (letter press printing, offset, lithography, intaglio, silk screen, book binding, photography)
Industrial Plastics (injection, rotational and compression molding, reinforced resins, extrusions, foams, thermoforming, coatings)
Metal (foundry, sheet, welding, ornamental, bench, spinning, forging and heat treating, machine)
Power (power mechanics, auto mechanics)
Wood (wood technology, cabinet making, pattern making, finishing, upholstery)

There are a number of emerging programs in industrial arts that warrant attention (see pages 43-45). Conscientious teachers may be able to use certain aspects of some of these to enrich their programs.

Industrial Arts Programs

Kindergarten-Sixth. Elementary industrial arts activities help reduce the level of abstraction and give more adequate meaning to some of the academic subject matter.

Classroom work is enriched through the use of manipulative activities which involve using tools

16670

and materials commonly found around the home. This helps pupils modify their strong individualistic tendencies by working and sharing with other children in a creative atmosphere.

Through integrated constructive handwork, pupils have an opportunity to enjoy the satisfaction of producing educationally-useful objects related to their studies. Such activity can do much to facilitate learning.

Approaches

- Self-contained class
- Self-contained class with assistance by industrial arts teacher
- Self-contained with instruction in the industrial arts laboratory
- Industrial arts separate, no self-contained class work

Program (for boys and girls)

Primary

- Group project activities — miniature stores, bus, train
- Related to subject areas
- Whole child is involved
- Activity limited to classroom

Intermediate

- Separate room desirable
- Serves individual needs
- Varied media should be available
- Provide for individual interest
- Projects should relate to basic subjects

Activities (pupil involvement in)

- Planning and designing
- Constructing
- Experimenting
- Visiting
- Exploring
- Collecting
- Observing

Fundamental skills can be acquired early.

Industrial arts should have its beginning at the elementary level.

Junior High School. Industrial arts is an integral and necessary part of the total program of education for all boys and some girls in grades seven through nine. Students at this grade level should be guided through a sequence of exploratory experiences in a variety of industrial arts areas. Included in the recommended minimum program for Iowa are: drafting, electricity-electronics, metal, and wood. Enriched programs at this level are encouraged when time permits and would include additional drafting as well as industrial plastics, graphic arts, or power mechanics.

At this level, special emphasis should be placed on helping students discover and develop their aptitudes, abilities, and interests. An understanding of the industrial-technological world and its effect upon our society should be developed. Provision should be made for the development of a variety of different kinds of skills. Opportunities should be provided for the creativity and ingenuity of students to come to the fore. A degree of proficiency in a variety of basic mechanical skills should be developed. Activities involving the practical application of mathematics, science, language arts, and social studies are inherent in industrial arts and should be exploited. Safe practices in the use and care of materials, tools, and equipment should be emphasized. Also, the program should assist in developing the ability to select, purchase, use, maintain, and service industrial products.

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963-A

Senior High School. The purposes for which students in grades nine (or ten) through twelve take industrial arts include general education, pre-collegiate, and to lay the foundation for occupational training.

Especially at this level, it is important to note that course work in industrial arts involves more than building a project. It is not reasonable to expect full attainment of industrial arts objectives through construction activities alone. Students should use textbooks, complete assignments in and outside of class, and, in general, approach their work as seriously as is done in any other area of the high school curriculum.

The well-rounded industrial arts curriculum at this level should include opportunities for students to engage in some activities not provided at the junior high school level, plus opportunities for advanced experiences in areas previously studied. The curriculum should provide opportunities for students to have comprehensive and enriching experiences that will enable them to acquire basic knowledge, understanding, and skill in the fundamental principles, techniques, procedures, and processes used in industry.

At this level emphasis should be placed on occupational practices and information relating to the specific industrial arts area. In this way advanced industrial arts work is effective occupational guidance for some students, while for others it provides opportunity for valuable experiences within an occupational area of their choice.

In addition, industrial arts activities offer excellent opportunities for students to develop leisure-time interests and skills so necessary for a well-rounded life.

It is strongly recommended that students have experiences in at least four of the industrial arts areas available in the school before they select an area for concentration.

Special Programs. Although little information is provided in this guide, the reader should remember that industrial arts can make valuable contributions to the education of adults, girls, academically talented, slow learners, and those that are physically or educationally handicapped.

Relationship of Industrial Arts and Area Vocational-Technical Schools or Community Colleges. The 1965 Iowa General Assembly passed legislation which provided for establishing a system of area schools to develop programs of vocational and technical education to serve the people of Iowa. This system of schools is designed to provide programs of up to two years in length to prepare people for employment in the broad fields of transportation, manufacturing, business, and the health occupations. Previous to this, relatively little opportunity for post-high school preparation in these fields existed in Iowa.

Area schools are of two general types:

- Area Community Colleges, which offer programs both in vocational and technical education and two-year junior college-type programs in the arts and sciences
- Area Vocational-Technical Schools, offering only the vocational and technical programs

Industrial arts attempts to *acquaint* students with the industrial world. Area schools seek to help people *acquire* the skills and knowledge necessary to enter the jobs which exist in industry. Since the two share some common interests and concerns, it seems in the best interests of the student and education in general that mutual contact and communication be carried on between these two areas of education.

The expanded opportunities in vocational and technical education made possible by the area schools in no way reduces the need for sound, comprehensive industrial arts programs. Indeed, an additional responsibility is placed on the secondary schools. The industrial arts programs in particular must provide young people with the kinds of experiences which will enable them to make the most effective use of the new opportunities at the area school level. In secondary preparation, students need a broad base of exploratory experiences to acquaint them with the wide variety of occupational areas. These experiences help them make realistic choices in future educational programs that lead to successful vocational placement.

In vocational and technical fields, industrial arts programs furnish the primary basis for obtaining such experiences. In fact, the full success of the area schools is dependent, to a large degree, upon sound industrial arts programs.

16672

The industrial arts teacher, with his practical knowledge of the world of work, is often looked to for vocational guidance information. In interpreting industry to students, he should be able to help them understand the types of education needed for different occupational fields, and the ways in which this education may be obtained. He should be acquainted with the programs offered in the local area school, the entrance requirements, and the procedures required in applying for admission. He will find it generally helpful, also, to have information available on programs offered in area schools outside his local area since many programs will not be offered in all areas.

Basic information on the program in each area school may be obtained from the manual, *Occupational Education Programs Serving Iowa Students,* published jointly by the Iowa Personnel and Guidance Association and the Guidance Services Section of the Iowa Department of Public Instruction. The counselors in your school should have a copy of this publication. Specific program information may be obtained from the area school's director of student personnel services.

Both industrial arts and area school personnel should work to develop mutual contacts and communication. In many cases they will be members of the same professional organizations. Area meetings, such as those sponsored by the Iowa Industrial Education Association, should involve both secondary school and area school people and should occasionally be held in the area school.

Area school personnel will welcome opportunities to speak to high school classes. They also encourage groups of students to visit the area school. Again, the director of student personnel services will generally be the best person to contact for such arrangements.

Frequent contact with the area school may be beneficial in other ways. Area schools will be conducting surveys of business and industrial firms in their areas to determine employers' needs for skilled personnel in various occupations. Information on such needs and trends will be available to industrial arts teachers.

The young people of Iowa will benefit to the maximum from post-secondary education if industrial arts teachers are familiar with the area schools, their programs, and goals. Such schools will become the next educational step for a number of industrial arts students.

16673

VI SELECTED ASPECTS OF ORGANIZATION AND ADMINISTRATION

Class Size and Teacher Load

The number of students in industrial arts classes should not be considered as a constant. Certain of the subject matter areas such as drafting lend themselves to larger classes than areas such as graphic arts where the diversity of activity or expensive and complicated equipment demands more individual supervision.

In no instance should the number of students exceed the equipment that is necessary to support instruction. Because of the nature of laboratory activities, the ideal class size may be as high as 24 students for drafting and as low as 16 for auto mechanics. In general, however, 20 students is considered to be a maximum class size for one teacher. Local conditions, such as high demand for certain classes and above-average facilities, may temporarily justify a small increase above these maximums.

The teaching load of an industrial arts instructor should always provide a period for preparation. A second period or a teacher assistant can certainly be justified and should be provided for the maintenance work that is inevitable when instruction in shop practices is being provided for novices, and the procurement of tools, equipment, and supplies necessary for instruction. *It is strongly recommended that the talents of professionally prepared industrial arts teachers be used in teaching and preparing for teaching activities — not dissipated in study hall supervision and non-related assignments.*

Schedule Practices

Students should be scheduled into industrial arts classes as they are scheduled into other classes, strictly on the basis of previous experience. The practice of scheduling according to grade level regardless of previous experience results in two or more levels within a class. Such an arrangement can be handled only by the most competent of teachers and then only by extra effort on the part of the teachers and students alike. Only if classes are unusually small can such a procedure be justified and educationally profitable.

Proper scheduling is probably more difficult for the smaller schools than for those of medium or larger size but even in the smaller schools scheduling problems have vanished as administrators with the knowledge of how students should be scheduled have attacked problems of this nature with a determination to solve them.

16674 181

Budgetary Practices

The industrial arts program must have adequate financial support if it is to achieve its goals. Although specific aspects of budgetary practices may vary, there are certain general principles which are worthy of comment.

Equipment Budget. There should be an amount of money set aside in the annual school budget for industrial arts equipment. This should be sufficient for replacing equipment that is obsolete and adding newly developed equipment for enriching the program. When a program is undergoing substantial change, it is sometimes advisable to set up a plan for purchasing equipment over a two- or three-year period. Normally this works no hardship, for programs which provide for two or more years of sequential coursework involving prerequisites do not happen overnight, they grow to full status over a period of years. The teacher who is to be responsible for selecting needed equipment should be informed of the size of his equipment budget so that plans can be made to secure the equipment most essential to his program as inexpensively as possible through the use of competitive bids.

Expendables Pertaining to Tools and Equipment. A separate budget should be set up for the purchase of expendables such as hack saw blades, files, circular saw blades, welding tips, and hand tools. Maintenance costs for repair or replacement of broken machine parts would be included here, too. Some school systems require that such expendables be requisitioned on an annual basis. This can be done, but it works a hardship on the teacher. Making accurate estimates of such needs on an annual basis is rather difficult unless the teacher has a backlog of experience in the specific teaching position at hand, and the tendency is to stockpile to guard against running short. It is suggested that a more reasonable approach is to purchase most of the materials on an annual basis. Quantity buying and taking competitive bids permits teachers to requisition smaller quantities of expendables as needed throughout the year. In addition, a small petty cash fund to meet emergencies will help the teacher in a metropolitan area to keep his shop operating at 100 per cent efficiency. Keeping this fund at a modest level of about $25 and having the teacher secure receipts for purchases should enable such a fund to be used in a businesslike manner.

Instructional Supplies. The cost of expendables such as glue, nails, rivets, solder, flux, photographic chemicals, printer's ink, oxygen, acetylene gas, and similar instructional supplies is often borne by the school. However, in some instances, the cost of such materials is cared for by charging each student a shop fee. Regardless of the approach that is used, it is suggested that the procedure outlined above be followed in securing such materials.

As programs come to include exercises, experimentation and research activities in addition to the traditional take-home project, needs for expendables of this type can be expected to increase.

Resale Materials. Except where school funds are used to provide materials for seventh, eighth, and sometimes ninth grade students, such materials as are used in take-home projects are usually paid for by the students. A punch card system that is used like a meal ticket with the cost of each project punched off as the materials are secured from the storeroom — or at the completion of the project — is commonly used. It is recommended that these shop cards be purchased at the school office, thus eliminating the need for the teacher to handle money.

The industrial arts department should not be expected to stock all materials which students might need in the construction of projects. There is much educational value to be derived from students' shopping for some of the needed materials. However, efficiency demands that the school stock materials which would be difficult to procure in the local area and materials which would be too cumbersome or heavy for students to bring with them.

Here again, it is recommended that the majority of such resale materials be purchased once a year in quantity, taking advantage of competitive bidding; but the teacher should be able to requisition materials which he finds in short supply as the need arises. Here, too, a small petty cash fund will be most helpful in meeting needs of an emergency nature.

School funds will, of course, be needed to establish an adequate supply of resale materials to support the instructional programs. When this has been done, the buying and selling of such materials should be operated from a revolving account which will remain relatively constant if materials are sold on a non-profit basis as they should be. The debits in this account are actually materials in the storeroom and the size of the expenditure reflects, to a degree, the readiness for instructional activities.

16675

Special Problems Relating to the General Shop (Drafting)

Regardless of how instruction is organized in the comprehensive general shop, a common method of getting started in the fall is to cover the drafting area in the first five, seven, or nine weeks before proceeding to any construction work in the shop. This approach is often justified on the basis that the student should be able to make working drawings for the construction work he will undertake. But many times the drafting that is taught is traditional plate making and little attention is given to project drawing and planning. If the teacher feels that instruction is most effective by covering drafting first, it is suggested that he be sure that such instruction be focused on the construction activities that will follow.

A different approach, which capitalizes on student interest by starting construction activities immediately upon the opening of school, is recommended. With a small amount of instruction in the reading of drawings, students can get off to a fast and exciting start in teacher-planned work. Drafting (including design and procedure planning) that is integrated closely with the work done in the shop can be taught one day per week throughout the year and gradually bring the student to the point where he is competent to plan his manipulative work on his own.

Adapting Programs to Local Needs

The realization that an industrial arts program should not be unduly influenced by local circumstances has been gradual but this idea is accepted now in most quarters. In fact, at present, there is substantial interest in a national curriculum for industrial arts. This would not be to limit local programs but to ensure that they include common essentials so that children of our highly mobile population not be victimized by a move from one state, city, or town to another but be able to make a smooth transition. Since industrial arts is general education, it follows that the basic program might well be the same regardless of locale. However, local conditions may be used to add zest to a sound program. For example, a resort area which abounds in water sports may emphasize construction of water skis in course work of an advanced nature. Activity that capitalizes on local conditions should never be allowed to dilute the basic program.

Integrating Mathematics, Science, and Other Subjects with Industrial Arts

The orbiting of Sputnik in 1957, some four months before Explorer I, brought the public school education of this country under sharp and sometimes critical scrutiny. The result was a crash program emphasizing those subjects which appeared to have the greatest potential for bettering our position in the space race. In the four to six years that followed, science and mathematics became the prestige subjects; and many of the practical arts, including industrial arts, waned, particularly in their ability to attract academically-talented students. This resulted in a trend toward justifying industrial arts for its ability to make scientific and mathematical principles meaningful through practical application. Some pursued this course to the point where industrial arts lost its identity as such and became secondary to the prestige subjects.

Now, with the advantage that hindsight always brings, two matters are quite clear: as important as the disciplines of science and mathematics are, they must take their place *along with*, rather than *supersede*, other subject matter areas; and industrial arts has more than enough content of its own to justify its being taught for the unique contribution it can make to the education of youth rather than the service it can provide for other disciplines.

With this understood, one can speak of the rich opportunities industrial arts provides for the practical application of scientific principles. The use of rules, squares, and dividers involves the meaningful use of mathematics. Many opportunities for increasing students' vocabularies exist in the names of new tools, machines, processes, and materials. The reading of specifications and writing of plan sheets provides experiences which require some facility in English. All industrial arts courses present many practical problems which serve to apply, reinforce, and extend students' knowledge in science, mathematics, English, and other subjects.

Record Keeping

Well-kept class and individual records are essential if classes are to be taught purposefully. They should help the teacher in his work rather than burden him. Most of the records which are kept will pertain to instruction but administration and safety records, as well as information pertaining to the physical facilities and supplies, should be recorded

16676

in a business-like manner, too. Various record forms are not difficult to find in professional books and magazines, but teachers often develop record forms tailored to fit their own situations. The following book, which consists entirely of forms which have been designed for use in industrial arts, has been published recently:

- *Organization and Administration Forms for Industrial Arts,* Instructional Materials Service, Series 1,000, Box 244, Kennedy, Minnesota 56733.

Records Pertaining to Instruction. It is well-nigh impossible for a teacher to remember what instruction has been presented to each of his classes, and individual students in those classes, together with the accomplishments and quality of work of each student. A record of demonstrations given and a well-kept progress chart for each class — together with individual planning sheets used by students — should enable the teacher to keep important instructional records in order.

Administration Records. Some of the records kept by teachers must conform to policies of the administration. Special forms together with instructions for their use are generally provided. Attendance records, daily work, test grades, and some indication of student deportment are typical of what is needed to maintain the permanent records of students. Many teachers find the most convenient way to contribute meaningful information on student deportment is to keep anecdotal records whereby unusual student behavior is noted on a card and placed in the student's folder.

Records Pertaining to Safety. A factual record should be made of all accidents which occur in the school shop. Student Accident Report forms are readily available from such sources as the National Safety Council and industrial commissions of some states.

If forms are not available, or if a school desires to develop its own forms, provision should be made for at least the following information: date, time, name of injured, site of injury, teacher in charge, nature of injury, cause of injury, how injury could have been prevented, by whom first aid was administered, disposition of case, and witnesses.

Two copies should be signed by the teacher, who should keep one copy. The other copy should be filed in the school office the same day of the injury.

General safety tests and individual machine tests, which must be passed before one is eligible to operate the specific machine, should be included in the safety records of teachers.

Records Pertaining to Physical Facilities and Supplies. Well-kept inventories of tools, equipment, supplies, books, and library materials will keep the teacher informed on the condition and replacement needs of such things, provide valuable information for the processing of requisitions, and furnish a new teacher with invaluable factual data as to what he can expect to find in the shop to which he is assigned.

Student Personnel Organization

The student personnel plan in industrial arts provides an excellent opportunity for students to develop desirable civic responsibilities as well as contributing to the efficient operation of the shop. Industrial arts classes have long used an organized system for cleaning and restoring the shop to order at the end of the period.* A student personnel

Movable tool storage.

***NOTE:** It is recommended that students be responsible for storing projects and personal articles, returning tools to their proper places, and cleaning all equipment and work benches down to the floor, but they should not be required to sweep the floor except in areas (such as around machines) where not to do so would result in hazardous conditions. Such a cleanup can be completed in about five minutes. Sweeping the floor each period will about double the cleanup time. Time is too precious to permit each class to lose 900 minutes (15 hours) a year in something as limited in educational potential as sweeping the floor. It is strongly recommended that janitor service be provided for industrial arts shops as is done for all other areas of the school.

16677

system extends this approach to other aspects of administration to make for smoother operation and increase the number of desirable student experiences. With proper direction, students can assist with such things as record keeping, taking attendance, dispensing materials from the storeroom, assuming certain responsibilities in regard to safety, checking in tools, and sharing in evaluations. Utilizing the student personnel plan places the student in many different situations which are quite real and closely related to future living. Students are caused to assume positions of leadership where they help make and enforce rules and are also placed in the position of having to follow directions of others.

Special Arrangements for Academically Talented Students

Oftentimes, students with college potential are prevented from taking industrial arts by the pressure of courses required for college entrance. Such students should be encouraged to take some industrial arts course work as a fifth subject, especially if they are interested in engineering, industrial arts teaching, industrial management, or any profession such as dentistry where small muscle coordination and finger dexterity are essential. Sometimes it is necessary to provide such a student with a varied schedule for each day of the week. This arrangement has been used successfully where students "contract" with the principal and teacher to follow a predetermined schedule which may indicate a different period each day in the week but still provide for five periods of industrial arts classtime per week. Contract students receive full credit and often serve as excellent examples of achievement to other students. It is believed that the contract approach for individual students is particularly appropriate in schools where industrial arts classes are small. In larger schools it may be possible for such students to receive industrial arts course work in a class that would meet on a varied schedule.

A well-designed, open tool panel is a must for each area of the shop.

16678

So often industrial arts has been less effective than intended because teachers did not write or follow course outlines, unit plans, or daily lesson plans and allowed their industrial arts courses to become practically 100 per cent activity, with learning taking place incidentally rather than purposefully.

Balancing Classroom and Shop Activities

Industrial arts should be taught in a purposeful manner with some attention given to the value of appropriate textbooks, outside-of-class assignments, supervised study, written examinations, performance tests, and the like. Some of the newer innovative programs (see pages 43-45) are criticized for placing too much emphasis on classroom activity and evaluative techniques. Such criticism may be justified. However, it should be remembered that traditional programs which are practically devoid of classroom activity can defeat the purpose of industrial arts as well as programs which involve too much classroom activity and insufficient shop activity. Some authorities have suggested that approximately 25 per cent of the available time be devoted to classroom activities and 75 per cent to shop-type activities. Teachers are encouraged to study this matter carefully and attempt to strike a balance between classroom and shop activities that proves to be most effective in helping the student to learn.

VII PURPOSEFUL TEACHING

Activities Appropriate to the Classroom

Classroom activity should be as carefully planned as activity that is carried on in the shop. A variety of classroom activities may be used appropriately in industrial arts courses. Some activities which seem especially useful and others that seem to require special comment are discussed below.

Use of Textbooks. Textbooks are as important as tools in present-day industrial arts. Early educational construction activities did not involve using textbooks, for the primary emphasis was on the development of skill in using tools. Nothing could replace activities in the shop in the attainment of such a goal. As an extra precaution in this, it was common for shop classes to meet double periods.

Since industrial arts classes have been placed on the same time schedule as other classes and goals have come to include the attainment of certain knowledge, attitudes, interests, appreciations, and skills, the need for using textbooks in industrial arts

16679

courses has become imperative. Out-of-class reading assignments can be given that will familiarize students with processes that are to be demonstrated, and the demonstration can then proceed with more understanding and efficiency. Similar assignments covering related information will permit in-class time to be used more profitably in discussion.

Classroom instruction is a vital part of industrial arts.

Many other opportunities exist for improving instruction in industrial arts through the use of a good textbook; in fact, textbooks are used in industrial arts just as they are in other courses except, perhaps, to a lesser extent. It is important that the time devoted to reading activity not jeopardize the shop time that must be reserved for manipulative activity if industrial arts is to make the type of unique contribution it should.

Lecture-Discussion. One of the oldest teaching methods which is used a great deal in formal education is the lecture. Unfortunately, as it is commonly used, it is one of the least effective methods of instruction. Its value in industrial arts is undoubtedly more limited than in disciplines such as social science; but as industrial arts courses become more technical in nature, some increase in the use of this teaching method may be appropriate. At such times careful preparation should be made and many illustrations be used — flip charts, overhead transparencies, and oral illustrations. Pertinent questions should be directed to students to encourage their involvement and to see if main ideas are being understood.

Team Teaching

It is becoming increasingly difficult for a single teacher to be highly competent in several industrial arts subject matter areas. Although large numbers of teachers must still attempt to do an acceptable job of teaching in more than one area, some teaching situations could use team teaching to good advantage. Where school systems operate a comprehensive general shop and two or more teachers are involved, team teaching might improve the instructional program. Many large junior high schools could take advantage of such an arrangement.

In large schools which offer several sections of the same course, the two or more instructors involved could easily form a team which would capitalize on the special teaching abilities and skills or knowledge of each.

Team teaching could also take place on an informal basis with teachers of different courses changing places for short periods of time, to teach units in the instructor's area of specialty to the other class.

Properly organized, this method should provide participating instructors more time for research and planning, resulting in richer content being presented to classes in a more efficient and understandable manner.

Programed Instruction

One of the newer methods of presenting content for a unit or course is by programed instruction. The initial furor over teaching machines died down as it came to be realized that the machine was comparable to the covers of a book whereas the program, the equivalent of the text of a book, was the heart of any teaching machine. Although many programs are designed to be used in specific machines, a number have been produced in book form or in ways that require very unsophisticated gadgets or none at all. Regardless of the form in which it appears, programed instruction is being used a great deal in industrial and military training programs and to a considerable extent in formal education. It requires that the learner be an active participant in the learning process and provides high retention, an effective means for individualizing instruction, and greater opportunity for teachers to increase their effectiveness through individual contacts with students. Research has shown programed instruction to be effective at all educational and ability levels and in many different subject matter areas, including industrial arts.

The industrial arts teacher who would like to use programed instruction in his courses will find that commercially prepared programs for this area are still somewhat limited, and suitable material may not be available. This situation is improving but rather than waiting for programs to be commercially produced or deprecating the method, it is recommended that teachers attempt to write short programs to

16680

use in their courses. This will require some study of the theory of programing and rigorous attention to detail when writing as well as a substantial investment in time, but those who have accepted the challenge of writing programs generally concur as to the value of this experience. Even if the program is less effective than desired, many values which result from the detailed structuring of discreet bits of subject matter accrue to the writer.

Resource Speakers, Field Trips, and Other Community Resources

The industrial arts teacher should be alert to the community resources that exist in his immediate area and opportunities that exist for improving instruction by utilizing them.

Resource Speakers. Persons from industry are willing and often enthusiastic about speaking to a group or class about an industry or some aspect of it in which they have some expertise.

Field Trips. It is not possible to duplicate the physical setting of industry in the school shop. However, it is possible to take the students to an industry where they can see the various talents, equipment, and teamwork needed to produce a product. Through field trips, students will be able to associate industrial methods and activities with the experiences they have encountered in the school shop. It is important that the teacher provide adequate orientation for the students before the trip so they will know what to look for. After the field trip, a discussion of what was seen is most appropriate to emphasize concepts which have been taught in the classroom. As more and more small industries develop in Iowa, it seems unlikely that any school will be so far from an industrial plant of some kind that the instructor cannot include one or more valuable field trips in his instructional program.

Other Community Resources. Some local suppliers are willing to bring equipment into the school shop and demonstrate a process which is so new that little published material exists. Few methods are more effective in capturing the interest of students, enriching instruction, and keeping the industrial arts program up to date. An alert, conscientious teacher will usually find other community resources that may be utilized to good advantage.

Out-of-class Activities

Industrial arts does not have the reputation for requiring time consuming or rigorous out-of-class activities and certainly this situation has considerable appeal for some students. However, as industrial arts courses are expanded and technical background information becomes increasingly important to the successful pursuit of shop activities, carefully planned out-of-class activities should become commonplace.

Homework. Industrial arts teachers should not hesitate to make assignments that would require several hours per week of out-of-class time. If industrial arts is to be on a par with other courses that are respected by students, faculty, and the community, it must compare favorably in the challenges it provides and the standards of work demanded; and appropriate homework assignments should not only result in coursework that is more meaningful and rewarding but might well improve the image of industrial arts.

Home Workshops. It is well-accepted that industrial arts has considerable potential for promoting the wise use of students' leisure time. Technology of the future promises a substantial reduction in hours per week of work and a corresponding increase in the amount of leisure time. It may be that industrial arts can make a most significant contribution in this area by encouraging the development, improvement, and use of home workshops. The industrial arts teacher can do a number of things to promote such activity. Discussing the value of hobbies and tools and equipment needed for certain hobbies; surveying and arranging for students to visit home workshops in the community; teaching a unit on reconditioning old tools; initiating a carefully organized tool-lending program; encouraging students to construct home workshop equipment such as miter boxes, bench hooks, and chisel handles as school projects; exhibiting work produced in home workshops; and many other things can be done to create interest in home workshops.

One of the most effective means of getting students actively involved is to allow credit for work done in developing or improving a home workshop and using a workshop for general repair work or construction of projects. If this is to be done, some means should be devised to see to it that no students are disadvantaged by their environment. The tool-lending program mentioned above may serve here.

Another important aspect of the matter which needs careful attention is that the teacher have some assurance that work submitted by the students be that of the student and no one else. A plan wherein students contract by a written agreement

16681

ILLUSTRATION SHEET 18.

with the teacher to carry out certain work on their own may provide the desired amount of control here. Admittedly, allowing credit for shop work that is done at home may be problematic, but it is felt that its value can outweigh any extra efforts that may be required to incorporate this feature in one's program.

Activities Appropriate to the Shop

Forerunners of industrial arts placed emphasis on various types of construction activity. Manual training emphasized acquiring skill with hand tools through wooden joint exercises. Sloyd focused on construction of articles that would have a utilitarian value in the home. Manual arts stressed that useful, take-home projects should be artistically satisfying. Industrial arts has capitalized on the inherent interest of construction and generally has considered the project as a vehicle for learning.

The emphasis of industrial arts on the project sometimes has resulted in unfortunate situations where the public relations value of large projects took precedence over their relevance to learning; where teachers involved themselves almost 100 per cent in individual supervision of students engaged in project construction with learning taking place incidentally rather than resulting from teaching certain important subject matter in each course on purpose; and where projects become the end goal rather than only one important means to the end. It should be realized that certain types of activity are more appropriate for changing certain types of behavior, and that choices should be made accordingly, keeping in mind some of the newer types of activity as well as the more traditional ones. (See pp. 43-45.)

Projects. Traditional, take-home projects are useful when they involve students in learning those things specified by the teacher in his course outline. Many large projects involve much repetitious work requiring skills of a rather low order. Under such circumstances, the student receives a diminished educational return on his investment of time and money. All projects, but especially the large showy ones, should be carefully evaluated and rejected as educationally unsuitable if they are found to involve work that is repetitious in nature. Due consideration should be given to the interest that is inherent in the construction of projects selected by students to meet specific needs but this should always be secondary to the one important question of whether the learning that results from building the project is educationally desirable.

Exercises. Although many industrial arts teachers feel there is a stigma attached to exercises, certainly well-designed exercise work is most appropriate when perceptual motor skills are to be acquired. Many students find exercises quite challenging and are strongly motivated to perform the exercises until they can demonstrate a high degree of skill in each. Some students, however, are not so challenged by this approach. The interest of these students can usually be maintained by allowing project work between exercises which involve only those skills mastered in previous exercise.

Experiments. Although the value of shop experiments has long been recognized by some teachers, it was not until some of the recent work in industrial arts curricula lent status to this type of activity that shop-experiments were given the impetus they deserved. Even though such activities result in a report rather than a project, experiments are capable of generating a great deal of student interest. Experiments should be well conceived and executed precisely, with data carefully recorded so that acceptable written reports may be made. Several shop experiment titles from the metal area are provided for illustrative purposes:

- An experiment in fluidity of aluminum at various temperatures.
- An experiment to determine the best temperature for pouring a certain casting.
- An experiment to determine the superiority, if any, of electrodes of the same AWS classification made by different manufacturers.
- An experiment to illustrate the manner in which aluminum flows during the spinning process.

The following publication should be of value to teachers and students who are interested in activity of this nature:

- *Experiments with Materials and Products of Industry,* Arthur W. Earl, McKnight and McKnight Publishing Company, Bloomington, Illinois 61701, 1960.

Group Projects

In the past the common vehicle of learning in industrial arts has been the project, designed and constructed by the individual student. But little of modern industry is based on the turning out of products which have been designed and constructed by individual craftsmen. A group project, where several students are involved with the problem of design, construction of the various components, and assembly of a one-of-a-kind finished product, is somewhat more representative of the team approach used in modern industry than the typical project

16682

approach. A machine or device needed for the school shop might be suitable for such a project.

Mass Production

Modern industry could not exist if it were not for mass production. The individual student project has some elements of industry insofar as design and construction of a pilot model is concerned, but it has little in common with the complex organization which enables industry to produce large quantities of items in the quickest, cheapest way possible.

If industrial arts is to realize one of its most important goals — that of developing an understanding of industry — some time during the latter portion of all basic industrial arts courses should be given over to a simulation of industry that is as valid as school shop facilities will allow. The mass production of some small product, with the students involved with both the design of the product and of the necessary jigs and fixtures needed for production, followed by the production of the component parts and assembly and finishing of the product, will do more for the development of an understanding of modern industry than mere words could ever do.

Wholesome guidance value may accrue from such activity, with students learning important things about themselves, such as their possession of a flair for organization, a distaste for dirty work, an interest in things requiring meticulous attention to fine detail, and a low tolerance for monotonous type work. A strong leaning toward a specific occupation may appear, or an abiding interest in the conditions and problems surrounding industrial employment may be developed.

Suggestions for organizing and carrying out a unit in mass production may be found in the professional journals. Teachers who have tried this method and are enthusiastic about the impact it has on students often submit articles containing information of value to the teacher who has yet to use mass production.

Two publications which may be useful are:

- *Manufacturing in the School Shop,* Robert W. Haws and Carl J. Schaefer, American Technical Society, Chicago, Illinois, 1960.
- *Industrial Techniques in the School Shop,* Irwin Sexton, Bruce Publishing Co., Milwaukee, Wisconsin, 1955.

Steps in small project mass production: acquire material, make layout, drill, saw, assemble. Result: the finished product.

Problem Solving*

The need for problem solving abilities in everyday life, together with the opportunities for problem solving that exist in the handling of tangible two- and three-dimensional materials in industrial arts, has fostered much interest in problem solving as an important learning activity in this area. Use of the technique is particularly appropriate for promoting original design of take home projects. The separate steps that are involved in problem solving are:

- *Identifying the problem.* All steps are important, but the first — identifying the problem — can make or break this approach. The problem must be carefully worded by the teacher to avoid restricting students' thinking. "A support for 8-10 books made primarily of wood" is likely to stimulate thinking and produce a greater variety of solutions than would result if "book ends, book shelf, book ramp, or book trough" were used.

- *Analyzing the problem.* This may be done individually, but it lends itself to group brainstorming sessions in which criteria such as stability, books well supported but easy to remove, book titles visible, easy to clean, structurally sound, and reasonable cost should be identified.

*Adapted from "Problem Solving and Design," Fern and Anderson, *School Shop,* May 1960, pp. 12-13+.

16683

- *Arriving at some tentative solutions.* The important thing here is that students not stop with their first idea. Students who are highly original should be encouraged in this. Others should be encouraged to search for book supports in stores, catalogs, or wherever they may be found for the ideas these can generate and the possibility of developing combinations or modifications that fit the criteria.

- *Selecting the most promising solution.* A scale model should be built to provide a three-dimensional look into problems concerning materials, construction, shape, size, finishes, and the like. Further modifications are made if necessary and drawings, together with a bill of materials, should be made for the final solution.

- *Constructing the project accordingly.* The construction phase involves many challenging problem situations. Considering and selecting the best method to join two pieces together or the best method to cut a compound angle are typical problems in which students may be involved. The instructor will be able to demonstrate those operations for which there is a common need. Special instructional needs which arise can be cared for on an individual basis.

- *Evaluating the project in terms of how adequately it satisfies each of the criteria specified in the analysis.* It is important that the student play a major role in this evaluation, individually or as a part of a teacher-student conference or a group discussion.

This type of problem solving permits members of a class or group, working cooperatively, to employ mass production techniques. It is not always necessary that students know all the operations in a given area before they undertake work in that area. Careful planning should permit successful use of this approach with beginning students.

Student Demonstrations

It is generally accepted that one seldom learns anything quite as well as when he is faced with the problem of passing on his information or skill to someone else. This is sufficient justification for involving students in the giving of demonstrations. There are a number of ways in which students can be so involved. In advanced courses in industrial arts, it is not uncommon to find students who have become sufficiently competent in a certain procedure on an out-of-school basis or in some other school to give a demonstration which the teacher would ordinarily present to the class. Also, students from advanced classes can be used to assist the teacher in giving some of the demonstrations which are presented to classes of beginners. It is, of course, important that the teacher go over details with student demonstrators ahead of time to ascertain that the presentation will be up to standard.

Another approach which is especially appropriate for use in general shop type courses involves students in presenting personal demonstrations to a fellow class member. If motivation is required, a minimum of one such demonstration can be set up as a course requirement with extra credit allowed for additional demonstrations. The procedure below provides directions for students in meeting this requirement.

As you near the completion of work in an area:

1. Find a classmate who will be moving into this area in the near future.

2. Agree upon a suitable operation (something of consequence yet not so complex that it would take more than 20 minutes to check someone out on it).

3. Schedule the demonstration at a time convenient to you, your classmate, and your instructor.

4. Practice until you feel sure of yourself. Be sure you are using an accepted procedure. Check details with instructor as necessary.

5. Give the scheduled demonstration.

6. Supervise your classmate in the activity.

7. Submit a brief report to your instructor containing the following:

   - date, time, and title of demonstration.

   - name of student receiving demonstration.

   - key points covered in demonstration.

   - evaluative comments by student receiving demonstration.

16684

VIII MEASUREMENT OF STUDENT ACHIEVEMENT

One of the most important jobs that a teacher has to do is that of evaluating his students.

Pertinent Aspects of Student Evaluation

Evaluation must be based upon the objectives assigned by the teacher to the course in question. Objectives should be clearly defined so that evaluation can show growth attained by students in accomplishing the objectives or disclose where the teacher should improve his instruction. It is most important that students be informed early in a course of the various types of performance that will enter into calculation of the course grade and the relative weight assigned to each.

Students in industrial arts become involved in many activities that are quite different from those found in the usual academic classroom. They participate in physical activity wherein materials of industry are processed with tools and machines to produce projects and carry out other types of manipulative activity as well as the acquisition of knowledge appropriate to the area.

Although the latter may be evaluated with paper and pencil tests, objective observation is important to document student development in manipulative skills, habits, and attitudes. Rating scales are recommended for evaluating industriousness, initiative, safety, cooperation, honesty, and consideration for others.

Tests are normally thought of in connection with determining achievement, but they are always more useful if they can be used also as teaching devices. Except for final examinations, this can usually be done by conducting test reviews as soon as possible after the tests have been taken and scored. This provides an opportunity for students to see where they responded incorrectly to specific questions and to clear up misconceptions they had at test time. It is important, of course, that all tests are prepared carefully. Unless a test is valid (measuring what it purports to measure) and reliable (always measuring the same under comparable conditions) its value is questionable.

Progress Chart

Progress charts are commonly used to show student achievement in industrial arts. Individual progress charts of a size that will fit in a loose-leaf notebook may be used, but it is more common for

16685

larger charts, mounted on a board and displayed publicly, to be used. Many teachers use progress charts to record only manipulative work; but if the display of this kind of performance is useful in providing motivation for the learning process, it is reasonable to expect that test grades and other evidence of student performance could be included and would be of similar value.

A progress chart provides students with an easy to understand picture of course work that has been accomplished, work that is under way, and that which lies ahead, and some have claimed it to be the greatest foe of indolence and indifference. This seems to be true especially at the junior high school level where students generally respond to competition in a wholesome manner. On the other hand, some educators fear that use of publicly displayed progress charts will focus attention on slower students and cause them to become discouraged. It is recommended that the teacher study this matter carefully and use the type of progress chart that he feels best fits his situation and students.

Student Self Evaluation

When a student turns in a piece of work and the teacher grades it, the student is being deprived of a very valuable learning experience. After all, the student who did the work is more familiar with what was done than anyone else; and if he has some knowledge of the standards of workmanship that are acceptable, he is one of the individuals best qualified to evaluate it. Being responsible for evaluating work they have done enables students to take pride in aspects of work that were well done and to honestly admit where improvements are needed. Improvement starts with one's realizing his deficiencies, but these deficiencies are easier to accept when self-awareness precedes criticism by the teacher.

Teachers who have not used this technique sometimes are concerned that students will not be sufficiently discriminating and will tend to rate themselves too high. The reverse is usually found to be true. But whether students tend to rate aspects of their work higher or lower than the teacher matters little. The opportunity that is presented for helping students recognize their work for what it is and adjust their standards to those of the teacher is what is important.

Self evaluation by students, of course, should not replace teacher evaluation. It should supplement teacher evaluation, always coming before it. The final grade for the work remains the responsibility of the teacher, but the single letter grade which usually represents the quality of the work is more meaningful to the student if he has had some self evaluative responsibilities.

A test of workmanship has been used on teacher-prepared plan sheets to introduce self evaluation to students. Students with experience in using such sheets can usually write their own test of workmanship for later work that is of their own choice and self planned. If tests of workmanship are felt to be too rigid, less formal paragraph-type self evaluations can be used.

Tests Which Are Appropriate

A number of tests can be used appropriately in industrial arts including objective tests, essay or short answer tests, tool recognition tests, object tests, and manipulative-performance tests.

Objective Tests. The objective test is the most satisfactory method of measuring the achievement of factual information in industrial arts. The test can be administered easily and a wide range of material can be covered in a minimum amount of time. Questions such as multiple choice, true-false, completion, and matching can be scored quickly without involving the personal judgment of the teacher. Such tests, however, are time consuming and rather difficult to write if they are to be valid and reliable. Another disadvantage of this type of test is that it does not allow the student to express himself in writing.

Essay or Short Answer Tests. Test questions that require students to compare, describe, or explain certain points are classified as essay questions if extensive writing is required. Short answer questions are those that can be answered satisfactorily with several words, phrases, one or two sentences, or a sketch. Essay tests have been criticized for the subjectivity of scoring, limited sampling, and the possibility of student bluffing. Short answer questions are somewhat less subject to such criticism. It is recommended that some carefully prepared essay and short answer tests be used in industrial arts course work to provide some opportunity for measuring the ability of students to organize their thoughts and express themselves clearly.

Tool Recognition Tests. The use of tests involving the recognition of tools is highly appropriate and

16686

popular with students and teachers. Tool recognition tests may be administered in an informal manner by displaying various tools for the students to identify. A more sophisticated variation of this test involves pasting one or more catalog pictures of tools on cards, which are passed, on signal, from one to another with students seated in a circle. By positioning himself in the circle, the teacher can handle extra picture cards if there are more cards than students. A further refinement is to have multiple-choice answers for each picture. This permits the use of answer sheets that can be machine scored, controls the use of slang or colloquial names of tools which students sometimes favor, and allows the test to be administered as a time test if this is desired. With the increasing availability of copying equipment, sets of picture cards can be easily reproduced. Some tool recognition items can be included in almost any paper and pencil test.

Object Tests. An object test in which the student identifies actual tools, materials, and supplies is highly appropriate for industrial arts. The items are displayed at various stations, and students move on signal from station to station in an orderly manner. Limited use of tools to make measurements or perform simple operations may be involved. The use of actual items is more realistic than pictures or word descriptions, and such a test is not only highly valid and reliable but is one that students find interesting.

Manipulative-Performance Tests. Written tests seldom are valid for the measurement of manipulative skills. Such skills are most generally evaluated by the industrial arts teacher as he examines specific manipulative work resulting from on-going activity in the shop and enters grades on a progress chart of some kind. This kind of record is useful if student activity in the shop is rigidly controlled, otherwise only a partial record of the manipulative skills of various students may result. A manipulative-performance test could be an objective, reliable, and valid means for completing the record. It requires students to complete one or more significant operations under rigidly controlled conditions. Each operation may require a number of steps. Students are often tested one at a time so each student can be observed carefully and a detailed record made of his performance. Where groups are being tested, the work pieces which result are carefully checked for accuracy and proper use of tools in the correct order. Individual manipulative performance tests may be as short as 10 minutes or as long as 50 minutes. A time of 30 to 40 minutes is suggested for manipulative performance tests administered to groups.

Utilizing Standardized Tests

Only a very limited number of standardized tests which apply specifically to industrial arts, or some particular course in this area, have been produced. The best source for standardized tests, Buros' *Mental Measurements Yearbook,* sixth edition, copyright 1965, lists just one high school industrial arts test of a general nature which might be of value. The entry is as follows:

> "Industrial Arts: Every Pupil Scholarship Tests." High school; 1962-63; new form (2-4 pages) usually issued each April; forms from previous testing programs also available; general directions sheet (1963, 2 pages); no data on reliability; norms for new forms available following testing program, 4 cents per test; 4 cents per key; postage extra; 40(45) or 50(55) minutes; Bureau of Educational Measurements, Kansas State Teachers College, Emporia, Kansas 66801.

It seems reasonable to assume that new forms have been and continue to be issued each April.

Another good source, *Tests in Print* by Oscar K. Buros, copyright 1961, lists two mechanical drawing tests and the *Middleton Industrial Arts Test* for high school. The dates are 1937, 1945, and 1951 respectively, and because of their age are assumed of little value.

A *Drawing Aptitude Test* is available from McKnight and McKnight Publishing Company, Bloomington, Illinois 61701, but its copyright date of 1940 causes its value to be suspected.

Although the number of useful standardized tests which apply specifically to industrial arts is limited, a number of standardized tests exist which purport to provide information about spatial aptitude, manual dexterity, mechanical ability and comprehension, and vocational or occupational interests. The industrial arts teacher may wish to have guidance personnel administer one or more tests of this type to certain students. Some of these tests are listed below.

Spatial Relations

- *Spatial Tests,* 1950-1959, Newnes Educational Publishing Co. Ltd. Town House, 8-11 Southhampton Street, London, W.C. 2, England.

16687

- *Flags: A Test of Space Thinking,* 1959, Education-Industry Service, 1225 East 60th Street, Chicago, Illinois 60637.

Manual Dexterity

- *Minnesota Rate of Manipulation Test,* 1946, Educational Test Bureau, Division of American Guidance Services, Inc., 720 Washington Avenue, S.E., Minneapolis, Minnesota 55414.
- *Purdue Pegboard,* 1941-1948, Science Research Associates, Inc., 259 East Erie Street, Chicago, Illinois 60611.

Mechanical Ability and Comprehension

- *Curtis Object Completion and Space Form Tests,* 1960-1961, Psychometric Affiliates, 1733 Monterey, Chicago, Illinois 60693.
- *Test of Mechanical Comprehension,* 1940-1954, The Psychological Corporation, 304 East 45th Street, New York, New York 10017.
- *Mechanical Movements: A Test of Mechanical Comprehension,* 1959-1963, Education Industry Service, 1225 East 60th Street, Chicago, Illinois 60637.
- *Purdue Mechanical Adaptability Test,* 1945-1950, University Book Store, 312 State Street, West Lafayette, Indiana 47906.

Vocational and Occupational Interest

- *Kuder Occupational Preference Record,* 1956-1963. Science Research Associates, Inc., 259 East Erie Street, Chicago, Illinois 60611.
- *Strong Vocational Interest Inventory,* 1927-1959. Consulting Psychologists Press, Inc., 577 College Avenue, Palo Alto, California 94306.

All of these tests are relatively inexpensive, except for the manual-dexterity tests which cost about $20 per set. It is believed that information provided by some of these, or similar, standardized tests, may help industrial arts teachers to be more effective in planning suitable instruction and in counseling individual students.

Recommendations for Project Grading

Projects and other types of manipulative work should be evaluated with more than one grade. A number of factors are involved in work of this kind. The quality of workmanship that is evidenced should be evaluated and a grade assigned. The quantity or productiveness that is represented by such things as the physical size of the work, its complexity, the degree of ingenuity exhibited, and the time required for its completion should also be evaluated and another grade assigned. Evidence of the student's ability to plan his work and follow his plan should also receive consideration and a separate grade. Confusion results when some or all of these, together with student attitude or cooperation, are combined into one letter grade for the project.

A project grading system in which specifics are isolated and can be examined and understood by whoever may be concerned, will improve communications in this area.

Reporting Course Grades with a Profile Card

A course grade is always a composite of various kinds of student performance. The teacher is aware of this because he is intimately involved in making whatever calculations are involved in arriving at the course grade. To the extent that they understand the grading system, students are also aware that the course grade is a composite; but even the better students seldom know, or remember, how they stand in the several different performances that are involved. Under these circumstances, the final course grade tends to obscure rather than communicate this information.

Parents usually have little idea of what makes up a final course grade and are seldom concerned unless they think their children have received a lower grade than was deserved. Communication can be improved in this area by supplementing the final course grade with profile cards.

The various kinds of student performance and weights used in the example below are illustrative only and should not be construed as an exact example to follow. Columns could be divided as shown or could show the frequency distribution in each category with the student's score encircled. (The teacher will likely have made these distributions for his own use anyway). For more sophistication, raw scores could be converted into percentile ranks and entered in each category, but it is questionable whether communications would be improved in proportion to the extra time which would be required to do this.

16688

Name of School _____ Date _____

John Doe's _____ performance in General Metal is shown below:

16689

IX USEFUL INFORMATION FOR THE TEACHER AS A PROFESSIONAL

Certain materials believed to be important to industrial arts teachers who are interested in improving their profession are included in this section.

Federal Funds for Industrial Arts

There has been a great expansion in legislation in recent years which has resulted in federal funds being made available for many different areas of education. The legislation which pertains to industrial arts is briefly described below.

National Defense Education Act. The National Defense Education Act of 1958 was the first major education act specifically designed to improve the instruction in academic subjects through direct aid to public schools. This act has been modified a number of times. The 1965 modifications included industrial arts in Title XI of the act. Basically, Title XI establishes institutes for advanced study for educators at many different levels.

Since January 1966, Congress has appropriated sufficient funds to support 63 NDEA institutes in industrial arts. Five pilot institutes in industrial arts were conducted in the summer of 1966, and 29 NDEA institutes were held in the summers of 1967 and 1968. A number of Iowa industrial arts teachers have profited from participating in one or more of these institutes. Such institutes will henceforth be supported by funds under a new Education Professions Development Act.

The Higher Education Act of 1966 was amended to include industrial arts as one of the critical areas under Title III of the National Defense Education Act. Passed October 21, 1966 (effective June 30, 1967), industrial arts, as a subject area, was included in all general federal legislation along with science, mathematics, English, and modern foreign languages.

NDEA Title III guidelines were revised April 1967, making industrial arts eligible to use any of the federal funds appropriated under this title for industrial arts. Such funds are contingent upon approval by the United States Office of Education of a state plan setting forth how the funds are to be used. Approved state plans permit the use of federal funds for equipment, teaching materials and aids, minor remodeling of buildings for industrial arts, inservice training of industrial arts teachers, and loans to private schools for improving industrial arts programs. Such funds became available to the states on July 1, 1967.

36 16690

Schools interested in qualifying for such funds may secure appropriate forms from the Coordinator, Title III, National Defense Education Act, Department of Public Instruction, Des Moines, Iowa 50319. A number of schools in the state have received industrial arts equipment with funds provided by the legislation.

Elementary and Secondary Education Act. Another major piece of federal legislation that has some effect on industrial arts is PL 89-10, Elementary and Secondary Education Act of 1965, passed April 11, 1965. This act contains five titles as follows:

Title I provides funds to school districts under state plans approved by the United States Office of Education to strengthen and improve elementary and secondary school programs for educationally deprived children in low-income areas. (Approximately 95 per cent of all school districts can qualify.) Funds can be used for equipment, instructional aids, more teachers, inservice training of teachers, and construction of facilities or buildings.

Title II provides funds for the purchase of library books, audiovisual material, textbooks, magazines, and reference books.

Title III of the bill, called "Supplementary Educational Centers and Services," provides funds for the establishment of special educational programs which have not been available previously.

Title IV provides funds to extend the cooperative research program of the U.S. Office of Education.

Title V authorizes funds for improving the effectiveness of state departments of education. In 1966, funds from PL 89-10, ESEA of 1965 were secured to provide a consultant in industrial arts for the State of Iowa and to develop a public information program designed to emphasize industrial arts as an aspect of general, non-vocational education.

Those interested in securing funds under the above titles are encouraged to contact their local administrators in charge of ESEA funds as to the procedure to be followed.

Higher Education Act. The Higher Education Act of 1965 includes industrial arts teachers and prospective teachers as eligible for graduate and undergraduate fellowships, loans, and grants of various kinds.

Conclusion. The initiative for securing federal funds rests with the individual teacher or local school district.

The following publication contains detailed information on the legislation cited above as well as some guidelines and outlines that would be helpful in preparing proposals:

- *Federal Aid for Industrial Arts,* The American Industrial Arts Association, 1210 16th Street, N.W., Washington, D.C. 20036. $3.75 (soft cover).

Legal Responsibility of the Industrial Arts Teacher

National Safety Council records show that at least one out of every eight school accidents takes place in school shop-labs. Laws which govern court action resulting from student injuries sustained in schools vary from state to state.

Most states still hold to common-law principles that provide immunity for school districts as agents of the state engaged in governmental functions. In such states the individual teacher tends to become the target for litigation; however, the limited financial resources of most teachers has tended to discourage such court action. Serious doubts have been raised concerning the justice of common-law principles; and a few states, including Iowa, have passed legislation that enables injured persons to recover damages from the school district. This reduces, but does not eliminate the likelihood that suits would be brought against individual teachers.

On January 1, 1968, the Tort Liability Act (Senate File 710) passed by the 62nd General Assembly went into effect. This legislation makes school districts in Iowa liable for the torts (wrongful acts which result in injury to another's person or property, and from which the injured party is entitled to compensation) of their employees. It also legalizes the purchase of liability insurance by school districts and makes some provision for school districts to provide defense for employees who are sued in the course of performing their work, and to compensate them for incurred loss when they are held liable.

As a result of this legislation, industrial arts teachers in Iowa may be somewhat more isolated

16691

ILLUSTRATION SHEET 19.

1666

from court actions resulting from student injury than ever before. However, none of the above may pertain if the teacher is proved negligent. Under these circumstances the personal liability insurance provided by the Iowa State Education Association for its members may be valuable. This insurance, which is underwritten by the Horace Mann Insurance Company, agrees to pay up to $150,000 for bodily injury caused by the teacher's personal acts committed in the course of duty as an employee of the school district. The insurance company also agrees to pay for the teacher's defense even if suit for damage is groundless, false, or fraudulent.

Other sources of liability insurance exist. For example, the American Industrial Arts Association offers $10,000 protection for $1 per year.

It is most important to realize that any amount of legal protection does not relieve the teacher of the moral responsibility to do all within his power to prevent accidents. Since students are minors, they are held only to the degrees of reference set by members of their own age group and not by adult standards. The teacher is held responsible for the actions of the students under his supervision. Accidents resulting from lack of proper safety instruction, unsafe machinery, hazardous aspects of the physical facility, or even carelessness of a student may be assessed as negligence on the part of the teacher. To prevent this, the teacher should establish a safety program that is a definite part of his course of study and be able to prove that each pupil received adequate safety instruction.

Safety Tests. Teachers should use safety tests. These tests should be kept because they provide a certain degree of legal protection. In addition they provide assistance in the instructional process.

Accident Reports. An accurate written report of an accident compiled right after it happened may be helpful in analyzing accident cause as well as of some value from a legal standpoint.

Waiver Forms. Waiver forms do not relieve a teacher of responsibility in accident cases. He remains liable for acts of negligence regardless of his possession of a form showing parental permission for a student to participate in school shop activities.

Workmen's Compensation. Teachers are sometimes injured in carrying out their employment responsibilities. In Iowa, teachers are included under the provisions of workmen's compensation, which basically provides compensation in lieu of wages for employees injured on the job.

Conclusion. It is suggested that specific state laws and references such as Chapter 10, "Shop Teacher Liability," in *Accident Prevention Manual for Shop Teachers* be used to provide additional information on this subject.

Professional Organizations

ACESIA. The American Council for Elementary School Industrial Arts, which is an affiliate of the American Industrial Arts Association, seeks to promote industrial arts in kindergarten through sixth grade. Membership is open to all members of AIAA. Annual dues are $3. Annual meetings are held in conjunction with the national convention of the AIAA. For more information write to: American Council for Elementary School Industrial Arts, 1201 - 16th Street, N.W., Washington, D.C. 20036.

ACIAS. The American Council of Industrial Arts Supervisors, which is an affiliate of the American Industrial Arts Association, seeks to promote better industrial arts in the public schools by improved supervision. Membership is open to members of the AIAA who are employed as supervisors of industrial arts. Annual dues are $3. Annual meetings are held in conjunction with the national convention of the AIAA. For more information write to American Council of Industrial Arts Supervisors, 1201 - 16th Street, N.W., Washington, D.C. 20036.

ACIATE. The American Council on Industrial Arts Teacher Education is an affiliate of the American Industrial Arts Association. Membership is open to AIAA members in higher education who are engaged in the preparation of industrial arts teachers. A yearbook, published annually, is distributed to members at no charge. A monograph series is also published. Annual meetings are held in conjunction with the national convention of the AIAA. For more information write to American Council on Industrial Arts Teacher Education, 1201 - 16th Street, N.W., Washington, D.C. 20036.

AIAA. The American Industrial Arts Association, which is an affiliate of the National Education Association, attempts to derive, define, and foster the professional ideals of industrial arts as a part of general education. It publishes the *Journal of Industrial Arts Education* magazine five times per

16692

year, which is distributed at no cost to members. It also publishes brochures and provides a packet mailing service for members. The organization has a national convention in the spring of each year.

Membership dues are $10 per year. For more information write to American Industrial Arts Association, 1025 - 15th Street, N.W., Washington, D.C. 20005.

AVA. The American Vocational Association has advocated the further development and improvement of industrial arts in the public schools for many years. This organization, which also includes such areas as agriculture, business, and home economics, has a vice president for industrial arts. It publishes *The American Vocational Journal* nine times per year which is distributed to members at no cost. A national convention is held each year in December. Membership dues are $12 per year ($8 if paid along with Iowa Vocational Association dues of $6). For more information write to American Vocational Association, 1025 - 15th Street, N.W., Washington, D.C. 20005.

Epsilon Pi Tau. This fraternity was founded in 1929 at Ohio State University. It is a professional fraternity of industrial arts advocates. Membership is by invitation only. Its purpose is social relationships, research, and the creation of skill in real craftsmanship.

IIEA. The Iowa Industrial Education Association includes teachers, supervisors and teacher educators of industrial arts, vocational industrial education, and technical education. It publishes a newsletter several times a year, which is distributed free of charge to all members. Annual meetings are held in conjunction with the meeting of the Iowa State Education Association in October of each year in Des Moines. Membership dues are $3.50 per year. For more information write to Robert Reuter, Treasurer of IIEA, East High School, Waterloo, Iowa 50703.

ISEA. The Iowa State Education Association has two publications. The *ISEA Communique* is a monthly newsletter type of publication. The *Communique* concerns itself with Iowa educators and the awards presented to some of them. It carries flash reports of general happenings in the field of education. The second ISEA publication is *Midland Schools*, which is printed bi-monthly. The magazine provides information on conventions and items of interest in general education. Both publications are provided to members free of charge. Dues are .4 per cent of the Iowa average instructional staff salary of the previous year. This association has been instrumental, along with the NEA, in increasing the salaries and improving the working conditions of educators in Iowa. For more information write to Iowa State Education Association, 4025 Tonawanda Drive, Des Moines, Iowa 50312.

Iota Lambda Sigma. Iota Lambda Sigma was founded in 1925 at Pennsylvania State College, now Pennsylvania State University. It is a professional fraternity of teachers, supervisors, and administrators of industrial arts and trade and industrial education. Membership is by invitation only. Its purpose is to promote industrial education by recognizing scholarship and training and to create a bond among persons in industrial education.

NAITTE. The National Association of Industrial and Technical Teacher Educators is an organization comprised of those who are members of an industrial teacher education staff or teachers, supervisors, or administrators of industrial education. It publishes the *Journal of Industrial Teacher Education*, a publication of research and professional reports of industrial teacher education. The *Journal* is published four times a year and is distributed to all members at no cost. Membership dues are $3 per year. For more information write to Membership Chairman of NAITTE, Purdue University, Lafayette, Indiana 47907.

NEA. Yearly dues for membership in the National Education Association are $15. The association publishes *Today's Education* and a newsletter, the *NEA Reporter*. *Today's Education* carries many current ideas and trends on education, unions, teaching methods, legislation, and the general movements and thoughts in education. For more information write to National Education Association, 1201 - 16th Street, N.W., Washington, D.C. 20036.

National Exhibitors Association-Ship. Founded in 1922 in St. Louis, Missouri, as a social organization, Educational Exhibitors Association-Ship is an organization of commercial people who deal directly with schools. Its purpose is to provide service, friendship, and fair dealings. It recognizes outstanding industrial arts educators as the "Ship's Man of the Year." The Ship provides advice to convention committees dealing with industrial education. It gives the industrial arts field a unique tie with personnel in industry and new products available from industry. Industrial arts personnel are not eligible for membership in this association, however, they should be aware of its existence.

16693

Recruiting Future Teachers

The present demand for industrial arts teachers far exceeds the supply. The prognosis for correcting this imbalance in the near future is not good. Industrial arts teachers can help with this problem by encouraging promising high school students to give strong consideration to preparing for teaching in this important curriculum area. Research indicates that teachers can be very influential in the recruiting of future teachers.

Industrial Arts Clubs

For many years some aggressive secondary school teachers have organized industrial arts clubs in their local school systems. Such clubs can now become a part of a nationwide network of American Industrial Arts Association-sponsored student organizations dedicated to "Learning to Live in a Technical World." Such topics as organizing and financing clubs, conducting meetings, suggested activities, and developing a constitution and bylaws are described in a handbook. Single copies of the handbook, certificate of merit and achievement, certificate of leadership, club charter, creed, motto, and the student membership card are available from the national office at no cost. To affiliate with the AIAA national industrial arts student club program, a list of student members' names and a check or money order for $1 per student are forwarded to the national office. A charter, signed and sealed, will be sent to the sponsor, together with membership cards to be filled in by the sponsor, signed by the school principal, and distributed to the student members.

Each student member will receive five issues each year of a newsletter with information on activities of other clubs, occupational trends, and articles of general interest. Club pins, keys, jackets, blazers, emblems, banners, office symbol plaques, secretary's books, treasurer's books, and club scrapbooks are available for affiliated clubs.

To affiliate or secure more information write to Director of AIAA Student Clubs, 1201 - 16th Street, N.W., Washington D.C. 20036.

Advisory Committees for Industrial Arts

The advisory committee concept has long been an integral part of most vocational programs. The 1963 Vocational Education Act requires that there be such a committee in operation on the local level for vocational education. Although advisory committees have not been used widely in industrial arts, some interest in this approach has been evidenced; and a number of local industrial arts programs are profiting from the use of such committees.

Advisory committees, if directed and used properly, can be helpful in initiating, improving, and maintaining a program. Typical activities include program evaluation, updating courses of study, surveying committee needs, arriving at standards, influencing legislation, publicizing school programs through news media, promoting school-community projects, and assisting in procurement of supplies, equipment, and physical space.

The following suggestions may be helpful in utilizing such a committee:

1. The instructor or administrator who is responsible for working with an industrial arts advisory committee should have some formal training prior to establishing a new committee or working with an existing one. He must be knowledgeable to the extent that he can define the differences in the philosophy of a vocational program and his program.

   Committee members must understand that an industrial arts program offers experiences for guidance and informational purposes. It should develop student interests, discover occupational aptitudes, provide safety education and acquaint students with industrial nomenclature. It should be the foundation for vocational and technical training, or engineering, or science, but normally would stop short of attempting to develop employable skills in trades or technical areas.

2. In communities where vocational programs are in operation, an advisory committee will probably already be functioning. It is possible that this committee might also serve the industrial arts program, provided that its members have a clear understanding of the differences in the aims and objectives of the separate programs and are willing and capable of acting discriminately.

3. The committee should function strictly in an advisory and promotional capacity and the responsibilities of the members should be clear-

16694

ly defined. Their activities must not usurp the authority of the school administrators or teachers.

4. There is no definite formula for selecting or appointing committee members. It is advisable to select or recommend citizens who are familiar with current industrial concepts, who are intelligent, who possess social vision and leadership qualities, and who enjoy social acceptance within their community. Final appointment should always be made through the superintendent of schools and by the board of education. The number of members can vary, but normally there is a minimum of three.

More detailed information can be found in the publications listed below. It is recommended that one or more of these be reviewed before attempting to formulate a committee.

- *American Vocational Journal,* May issue, 1965, is entitled, "The Role of Advisory Committees in Strengthening Vocational Education," and contains three articles pertaining to advisory committees.

- *Journal of Industrial Teacher Education,* "Functional Advisory Committees for Vocational-Technical Education Programs," Stadt and Jensen, Vol. 4, No. 2 (December issue, 1966) pp. 4-11.

- *Teaching Successfully in Industrial Education,* Curry Silvius, pages 598-601, McKnight and McKnight Publishing Company, Bloomington, Illinois 61701, 1967.

- *U.S. Office of Education, Publication No. 84009,* "Organization and Effective Use of Advisory Committees," Washington, D.C.

- *Vocational Advisory Committees,* 32 pages, 1959, order from American Vocational Association, Inc., 1025 - 15th Street, N.W., Washington, D.C. 20005, 30c.

Keeping Abreast of Research

More research is being carried on today than at any other time in the history of industrial arts. Those teachers who are working toward an advanced degree full time, summers, or by taking evening or Saturday classes are usually forced to keep abreast of research by the course work in which they enroll. Others must do it themselves, and this can be more difficult. The professional journals are suggested as being helpful. *School Shop* and *The Journal of Industrial Arts Education* often include articles based on a specific piece of research. *Industrial Arts and Vocational Education* publishes similar articles. A column on recently completed research by Dr. William P. Spence, dean of the School of Technology, Kansas State College, Pittsburg, Kansas, is published from time to time. *The Journal of Industrial Teacher Education* is especially useful since it is devoted primarily to reporting research.

Institutions which offer work leading to a doctor's degree in industrial education usually publish abstracts or reviews of research completed under their auspices and are willing to send such reports to educators requesting them. Of course, teachers who are close to college or university libraries can avail themselves of such resources as dissertation abstracts.

Keeping Pace with Technological Changes

There are those who feel that traditional industrial arts as taught by an enthusiastic and energetic teacher will attain the major objectives as set forth on pages 5-6 in an admirable manner. Others feel that some of the new concepts which are emerging from innovative programs in this curriculum area are better suited to attaining these objectives. It is not the place of this publication to prescribe the direction which local industrial arts programs should take. It is suggested, however, that teachers become quite sensitive to the effectiveness of the approach they use, keep abreast of new developments, and ever seek to improve their industrial arts program, specific courses within the program, and all aspects of instruction within the courses.

Contributions of Industry

Industry not only supplies the subject matter for industrial arts, but it stands ready to assist in many ways. Resource persons, to present materials to classes or assist the teacher with specific problems, are available upon request. Many good motion pictures produced by various industries are available on free-loan. Most local industries stand ready to open their doors to industrial arts classes for field trips. In some instances certain equipment that a local industry considers extra or outdated can prove to be very valuable in a

16695

school shop. Local industries are often willing to donate such equipment and serve in other ways to pave the way for securing equipment and materials which are beyond the financial means of the school or are difficult to procure.

It is important to realize that the key to securing help from industry is the industrial arts teacher. Unless he makes his needs known, industry's resources will go untapped.

New Directions for Industrial Arts

Over 60 years ago Charles Richards questioned more or less meaningless projects in industrial arts and expressed concern that an orderly way should be sought to develop an insight into the basic industries of our time. Although 60 years have passed, Richards' words are possibly more significant today than ever before. Many industrial arts programs today are inadequate for fostering a proper understanding of today's vast industrial complex. Yesterday's skills are not sufficient for today's and tomorrow's ever-changing occupations. A program that reflects a broad perspective of our industrial society should be provided. Industrial arts teachers cannot remain oblivious to the vast knowledge explosion and continue a traditional skill-development approach with antiquated tools and equipment. Such programs tend to enclose the students in a teacher-dominated environment with little or no opportunity for problem solving, creativity, or self discovery on the part of the student.

Fortunately for the profession, many leaders in the field of industrial arts have become vitally concerned about the future of industrial arts. Many efforts have been focused on determining a truer perspective of industry and using current educational psychology and recent research in learning to develop new approaches. Some of the new approaches have been designed as entirely new programs to replace industrial arts, but others may be considered as options in an existing program. Teachers are encouraged to examine these new approaches carefully as they search for more effective means of providing instruction more relevant to the needs of today's students.

American Industry Project

Objectives. To understand industrial concepts and develop problem-solving abilities related to industry.

Central theme. Conceptual analysis of a body of knowledge needed to understand any industry based on interrelationships of communication, transportation, public interest, finance, physical facilities, research, purchasing, industrial relations, marketing, management, production, materials, processes, and energy.

Grade level (experience levels used). General understanding of the structure of industry, greater depth in the major conceptual area of the structure, and independent research of a problem of interest in one of the conceptual areas of the structure.

For further information. Dr. Eugene Flug or Dr. Wesley Face, Stout State University, Menomonie, Wisconsin 54751.

A New Industrial Arts for Today's Schools (Prospectus 1966)

Objectives. To help students, by a study of their technological environment, to discover, develop, release, and realize their own native potential therein.

Central theme. Body of knowledge derived from analyzing the manufacturing, construction, transportation, communication, power, service, management, and research categories of American industry.

Grade level. All levels.

For further information. Dr. Delmar W. Olson, Kent State University, Kent, Ohio 44240.

Functions of Industry

Objectives. To provide vocational guidance through experiences that promote understanding about industry and prepare students for active participation in industry.

Central theme. Functions of industries including activities essential to the production of a product — research, development, planning, and manufacture; and activities essential to the servicing of a product — diagnosis, correction, and testing.

Grade level. Designed for exploratory phase of industrial education.

For further information. Dr. Willard M. Bateson, Wayne State University, Detroit, Michigan 48202.

Industrial Arts Curriculum Project

Objectives. To enable students to describe the basic steps that must be taken to produce a product in their environment.

Central theme. Industrial praxiology. Groups of students pursue construction and manufacturing activities. Ability to do is essential. Knowledge of how to service a product is derived from a knowledge of how it is made.

Grade level. Presently seventh, eighth, and ninth grades but may be expanded to tenth, eleventh, and twelfth grades in the future.

For further information. Dr. Donald G. Lux, Ohio State University, Columbus, Ohio 43210.

16696

At this writing it is not possible to determine what specific direction a new program for the teaching of industry may take. The industrial arts program of the future may concern itself with industrial technology where the general rather than the specific reaches its ultimate. The industrial technology laboratory of the future may present opportunities for investigation, experimentation, and problem solving using tools, machines, and materials which are rarely found in present industrial arts shops. Wind tunnels, water tanks for marine testing, equipment for refrigeration and heating units, and extensive testing equipment may be common to such facilities.

Examining specimens with a metallurgical microscope.

The teacher may be featured in the role of providing guidance rather than masses of facts. Having a student's pursuits exceed his own knowledge in any given subject may be commonplace. Whatever the future brings, it should be exciting.

Selected Professional Publications

- *Accident Prevention Manual for Shop Teachers,* William A. Williams, (editor), a professional publication of the National Association of Industrial Teacher Education, American Technical Society, Chicago, Illinois, 1964.

- *Addresses and Proceedings of the American Industrial Arts Association Convention,* published annually following the convention, American Industrial Arts Association, 1201 - 16th Street, N.W., Washington, D.C. 20036.

- *American Vocational Journal,* published monthly September through May, official publication of the American Vocational Association, Inc., 1025 - 15th Street, N.W., Washington, D.C. 20005. Distributed at no cost to members, library subscription $4 per year.

- *Course Construction in Industrial Arts and Vocational Education,* J. W. Giachino and Ralph Gallington, American Technical Society, Chicago, Illinois, 1961.

- *Course Making in Industrial Education,* John F. Friese and William A. Williams, C. A. Bennett Company, Peoria, Illinois, 1966.

- *Diamond Dust,* Tom Diamond, Prakken Publications, Inc., Ann Arbor, Michigan, 1959.

- *Education and Productive Society,* H. R. Ziel, (editor), Report of Inaugural Conference, Department of Industrial and Vocational Education, University of Alberta, Edmonton, Canada, 1964.

- *Guide to Industrial Arts Teaching,* Joseph Littrell, C. A. Bennett Company, Peoria, Illinois, 1966.

- *History of Industrial Education in the United States,* Melvin L. Barlow, C. A. Bennett Company, Peoria, Illinois, 1967.

- *Improving Instruction in Industrial Arts,* William A. Bakamis, Bruce Publishing Company, Milwaukee, Wisconsin, 1966.

- *Industrial Arts Education,* John L. Feirer and John R. Lindbeck, Center for Applied Research in Education, Inc., 70 Fifth Avenue, New York, New York 10011, 1964.

- *Industrial Arts in General Education,* Gordon O. Wilber and Norman C. Pendered, International Textbook Company, Scranton, Pennsylvania, 1967.

- *Industrial Arts Education, Purposes, Programs, Facilities, Instruction,* American Council of Industrial Arts Supervisors, American Industrial Arts Association, Washington, D.C. 20005, 1963.

16698

- *Industrial Arts and Technology,* Delmar W. Olson, Prentice-Hall, Inc., Englewood Cliffs, New Jersey 07632, 1963.

- *Industrial Arts and Vocational Education,* published monthly except during July and August, Bruce Publishing Company, 400 North Broadway, Milwaukee, Wisconsin 53201. $4 per year.

- *Industrial Education: American Ideals and Institutions,* Berenice M. Fisher, University of Wisconsin Press, Madison, Wisconsin 53706, 1967.

- *Iowa Industrial Education Association Newsletter,* published several times a year, editor, Kenneth Rogers, Industrial Arts Instructor, Columbus High School, Waterloo, Iowa, distributed at no cost to members of Iowa Industrial Education Association.

- *Journal of Industrial Teacher Education,* four issues per year, official publication of the National Association of Industrial and Technical Teacher Educators, distributed at no cost to members. Library subscription $5 per year. Mail to: Professor Howard McVicker, Purdue University, Lafayette, Indiana 47907.

- *Measuring Educational Achievement,* William J. Mickeels and M. Ray Karnes, McGraw-Hill Book Company, Inc., New York, New York, 1950.

- *Modern School Shop Planning,* Prakken Publications, Inc., Ann Arbor, Michigan, 1967.

- Monograph Series, American Industrial Arts Association, 1201 - 16th Street, N.W., Washington, D.C. 20036.

- *Organizing Course Materials for Industrial Education,* G. Harold Silvius and Ralph C. Bohn, McKnight and McKnight Publishing Company, Bloomington, Illinois 61701, 1961.

- *School Shop,* published monthly except during July and August, Prakken Publications, Inc., Box 623, 416 Longshore Drive, Ann Arbor, Michigan 48105. Distributed at no cost to teachers of industrial arts. Write on school stationery requesting that your name be placed on the mailing list. Library subscription $4 per year.

- *Selected Readings for Industrial Arts,* Rex Miller and Lee H. Smalley, McKnight and McKnight Publishing Company, Bloomington, Illinois 61701, 1963.

- *Teacher Liability in School-Shop Accidents,* Dennis J. Kigin, Prakken Publications, Inc., Ann Arbor, Michigan 48105, 1963.

- *Teaching Successfully in Industrial Education,* G. Harold Silvius and Estell H. Curry, McKnight and McKnight Publishing Company, Bloomington, Illinois 61701, 1967.

- *Teaching the Industrial Arts,* Emanuel E. Erickson, C. A. Bennett Company, Peoria, Illinois, 1960.

- *The Instructor and His Job,* Homer Rose, American Technical Society, Chicago, Illinois, 1961.

- *The Journal of Industrial Arts Education,* published five times during the school year, 3110 Elm Avenue, Baltimore, Maryland 21211, official publication of the American Industrial Arts Association, distributed at no cost to members. Single copies to non-members $1.50, library subscription $6 per year.

- *Yearbook of the American Council on Industrial Arts Teacher Education,* published annually in the spring, McKnight and McKnight Publishing Company, Bloomington, Illinois 61701, distributed at no cost to members of the Council. Orders and requests for information about cost and availability of yearbooks should be addressed to the company.

Selected Publishers of Industrial Arts Books

The last few years have seen quite a number of book publishers join the ranks of those that have been publishing industrial arts books for many years. The following list includes some of the newer publishers which seem to have the most to contribute to the field together with those publishers that are well established and better known. Catalogs or information about specific publications may be secured by writing to the address given.

- American Technical Society, 848 East 58th Street, Chicago, Illinois 60637.

240

Assignment

Work Sheets 27 to 32 inclusive: Make a three-view dimensioned instrument drawing of each of these objects. Show top, front, and right end views. Refer to Illustration Sheets 15, 16, 17, 18, and 19, pages 59, 61, 63, 65, and 67. First make a freehand plan on practice paper and have it checked. When the plan is approved, make the instrument drawing on the Work Sheet including the lettering in the title strip. Have the drawing checked and graded.

WS. 27. Angle Step.

WS. 28. Notched Slide.

WS. 29. T Block.

WS. 30. Slotted Wedge.

WS. 31. Bearing Slide.

WS. 32. Forming Block.

WS. 33. Wedge Guide: Make a three-view dimensioned instrument drawing of the Wedge Guide. Show top, front, and left end views. Note that a left end view is called for because the left end shows the object more clearly than a right end view would show it. First make a freehand plan and have it checked. When the plan is approved make the instrument drawing, including the lettering in the title strip. Have the drawing checked and graded.

WS. 34. Guide Bracket: Follow the directions given for Work Sheets 27 to 32.

1667

- The Lincoln Electric Company, Box 3115, 22801 St. Clair Avenue, Cleveland, Ohio 44117.

- The L. S. Starrett Company, Athol, Massachusetts 01331.

- National Rural Electric Cooperative Association, 2000 Florida Avenue, N.W., Washington, D.C. 20009.

- Rockwell Manufacturing Company, 4020 North Lexington Avenue, Pittsburgh, Pennsylvania 15208.

Sources for Free and Inexpensive Teaching Aids

Free and low cost teaching aids exist in great abundance. Brochures, catalogs, folders, posters, wall charts, bulletins, manuals, and literature which might be useful in teaching are available from suppliers and manufacturers of school shop tools and equipment for the asking. Teachers are encouraged to scan the advertisements in professional journals for offers of this type. Of special interest is the October 1968, issue of *School Shop* which lists specific materials offered by 171 advertisers. Similar special issues focusing on "Shop Teachers' Service" have been published on an annual basis for a number of years.

Members of the American Industrial Arts Association will receive certain free materials through the packet mailing service provided by the organization.

Sources for Films and Filmstrips

A number of excellent films and some filmstrips are available from large companies on a free loan basis. Careful previewing by the teacher is essential to screen out those of doubtful instructional value. However, these sources should not be relied upon for supplying all such needs. Your school should have some of the following reference materials on hand.

- *Educational Media Index,* Volume 9. McGraw-Hill Book Company, New York, 1964. Cost about $7. Includes industrial arts, technical training, vocational training, and agricultural education.
- *Educators Guide to Free Films,* Educators Progress Service, Randolph, Wisconsin. Cost about $9. Revised annually; motion pictures in all subjects.
- *Educators Guide to Free Filmstrips,* Educators Progress Service, Randolph, Wisconsin. Cost about $6. Revised annually, filmstrips and slides in all subjects.
- *Motion Pictures and Filmstrips,* Library of Congress, Washington, D.C., 1953 to date. Published quarterly; annual cumulations; all motion pictures of educational value released in the United States or Canada and cataloged by the Library of Congress.

Many colleges and universities have film libraries from which motion pictures, filmstrips, and other audiovisual materials may be rented. These and certain other sources are included in:

- *A Directory of 3,660 16mm Film Libraries,* United States Government Printing Office, Washington, D.C., 1959.

Your school should have catalogs from at least the following:

- Bureau of Audio-Visual Instruction, Extension Division, University of Iowa, Iowa City, Iowa 52240.
- Visual Instruction Service, Iowa State University, Ames, Iowa 50010.

Several other sources which may be useful are:

- Association Films, Inc., 561 Hillgrave Avenue, La Grange, Illinois 60525.
- Bureau of Mines, Motion Picture Distribution Center, 4800 Forbes Avenue, Pittsburgh, Pennsylvania 15213.
- Modern Talking Pictures Service, Inc., c/o Modern Sound Pictures, Inc., 1410 Howard Street, Omaha, Nebraska 68102.
- Modern Talking Pictures Service, Inc., c/o Pratt Sound Films, Inc., 129 Third Avenue, S. W., Cedar Rapids, Iowa 52404.

The value of purchasing films that will have regular use over a period of years should not be overlooked. Films and filmstrips keyed to textbooks are available. Some information along this line is available from:

- McGraw-Hill Text Film Division, 327 West 41st Street, New York, New York 10036.

16701

CONSTRUCTION TECHNOLOGY

16702 49

Financially, the construction industry is the largest industry in America. Its existence satisfies the basic human need of shelter, as well as a multitude of additional necessities and luxuries found in our everyday life. Our current population explosion, coupled with our tremendous desire for a high standard of living, places an enormous demand upon this industry.

This demand is so great that the U.S. Department of Labor has made the astounding statement that in the next 30 years there will be as much new construction in America as presently exists.

At the present time, the greatest deterrent to meeting the needs is that of manpower. By 1975 we will need one million more construction workers. The present rate will provide only 150,000, which leaves a net shortage of 850,000 workers in the construction industry.

Youngsters seem to be naturally curious about construction in the community. Some study of the contributions made by carpenters, masons, plumbers, electricians, and other skilled tradesmen to our way of life could enrich classroom instruction at the elementary level. Field trips could be taken to construction sites where the whir of the saw biting into wood and the groan of the crane lifting steel girders into place can make indelible impressions on young minds.

Although much study and substantial activity could be pursued in this area at the junior high school level, fewer limitations and greater interest seem to exist in construction technology at the senior high level. Here, students are sufficiently mature, physically, to engage in common construction activities, and they are of an age when many see the value of acquiring knowledge and skill in this area as a stepping stone to possible part-time employment. It is important that courses in this area be designed to help students lead fuller lives through understanding and skills acquired. Limited work in this area can be undertaken with the tools and equipment commonly found in a general shop or unit wood shop, but a strong offering in construction technology will require certain specialized tools, equipment, and facilities.

Mathematical and scientific principles should be integrated with such course work, and safety instruction is essential to this area. Much of the student activity should involve the group approach; however, mass production and individual activities have merit under certain conditions.

Objectives

Every student should have the opportunity:

- To develop interest in and enthusiasm for the fundamental principles and work experiences of the building construction industry.
- To develop knowledge and basic skills in the use of common materials and tools of the building construction industry.
- To develop understanding and appreciation for the building trades and their major role in our culture.
- To learn desirable work habits and a responsible attitude toward personal safety and safe construction practices.

Content

Although some common areas of industrial arts have a marginal relationship with the construction industry, this important industry has seldom received adequate consideration in industrial arts programs. Three construction technology courses, carpentry, concrete technology, and masonry, are presented in the following outline.

It is believed that these materials will help industrial arts teachers in establishing an exciting and stimulating offering which will promote a better understanding of this great industry. The teacher should recognize that this is a guide and draw from it those portions that best fit his school and teaching situation. Since this is one of the newer areas, teachers may find suggested student activities to be particularly helpful. Some activities are included and are illustrated for quick reference.

Carpentry

I. Introduction

II. History

III. Materials
- A. Hardwoods (types and grades)
- B. Softwoods (types and grades)
- C. Plywoods (types and grades)
- D. Wood composition boards
- E. Plastic laminates
- F. Insulation materials
- G. Gypsum materials

C

16703

H. Asphaltic materials
I. Adhesives
J. Fastening devices

IV. Tools
A. Measuring tools
B. Guiding and testing tools
C. Marking tools
D. Tooth-cutting tools
E. Sharp-edge cutting tools
F. Smooth-facing tools
G. Boring tools
H. Fastening tools
I. Holding tools
J. Power tools

V. Safety
A. Work habits
B. Housekeeping
C. Personal protective equipment
D. Lifting and carrying
E. Scaffolds and ladders
F. Hand tools
G. Electrical tools
H. Power-actuated tools

VI. Foundations
A. Layout
1. Use of hand level
2. Use of builder's level
3. Setting batter boards

B. Footing forms
1. Pads
2. Continuous footing

C. Wall forms
1. Whalers
2. Cleanouts

Construction technology: form construction.

3. Plumbing outside corners
4. Aligning wall forms
5. Bracing wall forms
6. Girder pockets
7. Opening bucks
8. Nailing blocks
9. Anchors
a. For plates
b. For intersecting walls
c. For masonry veneers

D. Concrete handling apparatus
1. Concrete chute
2. Splash board
3. Runways
4. Wheelbarrows
5. Concrete buggies
6. Auger and pneumatic systems
7. Conveyor

E. Sectional forms
1. Job constructed
2. Commercial

F. Stripping concrete wall forms

Foundation wall.

167 04

Activities

- Lay out a foundation for a building and set batterboards. Construct footing forms; both "T" and keyed.
- Make detailed sketches of wall forms for a building.
- Build a section of wall forms using different types of ties.
- Visit a construction site where forms are being constructed and stripped.

VII. Rough framing

A. Sills
   1. Aligning and installing plate
   2. "L" sill
   3. "T" sill
   4. Joist layout
      a. Wood frame construction
      b. Masonry construction

B. Joists
   1. Framing, installing and aligning joist
   2. Bridging
      a. Wood
      b. Metal
   3. Layout and framing of floor openings
   4. Masonry tile floors
   5. Exterior door sills

Framing.

C. Subfloors
   1. Diagonal
   2. Straight

D. Stairs
   1. Story pole
   2. Well opening layout
   3. Stringer layout
      a. Cutout
      b. Build-up
      c. Cleated

E. Walls
   1. Laying out wall plates
   2. Laying out wall frame story pole
   3. Framing exterior and interior corner post
   4. Framing window and door opening
   5. Assembling wall frames
   6. Raising wall frames
   7. Plumbing and aligning wall frame assembly
   8. Installing diagonal bracing and alternatives
   9. Installing top wall double plates
   10. Laying out and framing arches
   11. Furring masonry walls

F. Ceiling joists
   1. Framing and placing
   2. Installing backing for lath, dry wall, hanging fixtures, cabinets, traverse rods

G. Scaffolding
   1. Double pole (wood and steel)
   2. Single pole
   3. Mason's

H. Sheathing
   1. Structural fiberboard, plywood, or gypsum
   2. Horizontal
   3. Vertical
   4. Diagonal

C

167 05

Activities

- Build section showing different sill construction.
- Construct a small building to show proper methods of rough framing.
- Lay out and construct a simple stair.
- Visit a job site in the rough framing stage.

VIII. Roof framing

A. Roof design
   1. Shed
   2. Gable
   3. Hip
   4. Gambrel
   5. Mansard

B. Trusses
   1. Types
   2. Installing

C. Use of framing square

D. Ridge boards
   1. Lay out
   2. Raise, plumb

E. Types of rafters
   1. Common
   2. Hip
   3. Jack

F. Laying out and cutting rafter
   1. Determine length
   2. Make plumb and cheek cuts
   3. Seat cut and overhang

G. Framing of openings in roofs

H. Sheathing roofs — cuts on hip line

I. Unequal pitch roof

J. Gable end studding

K. Shingling
   1. With wood shingles
   2. With composition shingles
   3. Around roof vents and chimneys

Activities

- Construct a hip roof on the rough frame.
- Lay out and construct roof trusses.
- Frame an opening in the roof section for a dormer.
- Shingle the constructed, sheathed roof section.

IX. Exterior finish

A. Exterior doors
   1. Jambs — laying out, cutting, and setting
      a. In wood frame construction
      b. In masonry construction
   2. Pre-hung doors

B. Windows — frame and masonry construction
   1. Double hung
   2. Casement
   3. Fixed
   4. Awning

C. Water tables

D. Cornice construction
   1. Open
   2. Box

E. Gutters

F. Columns, beams, newels, and railings

G. Corner treatment

H. Siding
   1. Horizontal
   2. Vertical
   3. Plywood
   4. Shakes

I. Hanging overhead doors

16706

Activities

- Hang an exterior door.
- Construct a pre-hung door.
- Install windows.
- Construct several different cornices.
- Install gutters and downspouts.
- Install several different types of siding.

Activities

- Insulate a building.
- Install drywall and tape joints.
- Panel a wall.
- Hang an interior door.
- Lay a hardwood floor.

C

X. Interior finish

A. Checking, sorting, and storing interior trim

B. Insulation

C. Drywall installation

D. Plywood paneling installation

E. Laying out and applying acoustical ceiling material

F. Windows
1. Laying out, constructing, and setting jambs
2. Hanging doors
   a. Pocket, double-acting, bi-fold, bi-passing, swing
   b. Hinges, butts, locks

G. Flooring
1. Subfloor
2. Underlayment
3. Hardwood
4. Resilient

H. Baseboards and shoe

I. Built-ins
1. Laying out cabinets
2. Constructing cabinets
3. Installing mill-built cabinets
4. Constructing closets and wardrobes
5. Installing plastic laminates

XI. Blueprint reading and estimating

A. Dimensions

B. Lines
1. Section
2. Hidden
3. Center
4. Extension
5. Border

C. Scale

D. Elevations

E. Foundation plans

F. Floor plans

G. Roof plans

H. Symbols

I. Specifications

J. Estimating check list
1. Stock bill
2. Survey
3. Subcontractors
4. Overhead
5. Summary sheet
6. Labor

16707

XII. Job opportunities in carpentry

A. Construction outlook

B. Manpower requirement

C. Related jobs

D. Personnel requirements
   1. Type of individuals wanted
   2. Education and training

E. Other considerations
   1. Job stability
   2. Salary
   3. Opportunities for advancement
   4. Working conditions

Concrete

I. Introduction

II. History

III. Properties of concrete

A. Plastic concrete

B. Hardened concrete

C. Variables that influence quality

IV. Uses of Concrete

A. Reinforced concrete

B. Pre-stressed concrete
   1. Pre-tensioning
   2. Post-tensioning

C. Pre-cast concrete

D. Lightweight concrete

E. Thin-shell concrete

F. Shotcrete

G. Tilt-up concrete

H. Sandwich wall

I. Lift slab

V. Portland cement

B. Raw materials
   1. Lime

16708

2. Silica
3. Iron oxide
4. Aluminum
5. Gypsum

C. Manufacturing process

D. Packing and storing

E. Classification of Portland cement — types I, II, III, IV, and V

VI. Water for mixing concrete — effect of impurities

A. Inorganic materials

B. Organic materials

VII. Aggregates for concrete

A. Characteristics of aggregates
1. Abrasion resistance
2. Resistance to freezing and thawing
3. Compressive strength
4. Chemical stability
5. Particle shape and surface texture

B. Quality testing of aggregates

C. Bank-run and commercially recombined aggregates

D. Lightweight and heavyweight aggregates

E. Graduation of aggregates

F. Maximum size determination of coarse aggregate

G. Storage of aggregates

VIII. Air-entrained concrete

A. Effects of entrained air
1. On fresh concrete
2. On hardened concrete

B. Air-entraining materials

C. Factors affecting air content

D. Measurement of air content

IX. Characteristics of concrete mixtures

A. Water-cement ratio

B. Maximum aggregate size

C. Air content

D. Slump

C

16709

X. Sampling and testing plastic and hardened concrete

A. Methods of sampling fresh concrete
   1. From stationary mixers
   2. From paving mixers
   3. From revolving drum truck mixers
   4. From open top trucks, mixers, or containers

B. Methods of testing fresh concrete
   1. Consistency test
      a. Slump test
      b. Ball penetration test
   2. Weight test
   3. Air content test
      a. Pressure method
      b. Volumetric method
      c. Gravimetric method

C. Methods of testing hardened concrete
   1. Specimen tests
   2. Compression tests
   3. Flexure tests

XI. Ready-mixed and job-mixed concrete

A. Production of ready-mixed concrete
   1. Advantages of ready-mixed concrete
   2. Specifications for ready-mixed concrete
   3. Remixing concrete

B. Preparing for ready-mix delivery
   1. Forms
   2. Tools and equipment
   3. Preparation of subgrade
   4. Vibration equipment
   5. Curing materials available

C. Dangers of adding water to ready-mix

D. Water-cement ratio for job-mixed concrete
   1. For exposure conditions
   2. For required compressive strength

E. Selection of good ingredients for job-mix
   1. Aggregate
   2. Mixing water
   3. Portland cement
   4. Air
   5. Sand — allowance for moisture

F. Proportions of materials

G. Mixing concrete

H. Cleaning equipment

XII. Placing and finishing concrete

A. Tools
   1. Straightedge
   2. Darby
   3. Bull float
   4. Edger
   5. Jointer or groover
   6. Power joint cutter
   7. Hand and power floats
   8. Hand and power trowels

16710

WS. 35. Miter Box: Make a three-view dimensioned instrument drawing. Use the scale 3/8" = 1". Show top, front, and right end views. First make a freehand plan and have it checked. When the plan is approved, make an instrument drawing, including the lettering in the title strip. Have the drawing checked and graded.

WS. 36. Bracket Shelf; Follow directions given for WS 35.

WS. 37. Book Ends: Follow directions given for WS 35 except that the scale is ¼" = 1".

WS. 38. Work Bench; Make a two-view dimensioned instrument drawing. Use the scale 3/32" = 1". Show a front view and a right end view. First make a freehand plan and have it checked. Complete the drawing.

WS. 39. Pig Bread Board: Layout lightly the horizontal and vertical lines. Make ½" squares, 15 squares long and 9 squares wide. Refer to Illustration Sheet 18, page 65. Draw the pig on the Work Sheet, placing the parts exactly on the larger squares. This is a method for enlarging a drawing.

WS. 40. Dog Book Ends: Make a full size front view of the Dog Book Ends. Layout lightly the horizontal and vertical lines to make the squares as shown in Illustration Sheet 18, page 65. Make the squares 3/8" in both directions. Enlarge the figure of the dog using these squares.

WS. 41. Footstool: Make a three-view dimensioned instrument drawing. Use the scale ¼" = 1". Make a freehand plan and have it checked before making the instrument drawing.

B. Placing concrete
   1. Time
   2. Transportation on the job
   3. Placing in forms — drop chute
   4. Consolidating concrete in forms — vibrators

C. Finishing concrete slabs
   1. Consolidating
   2. Striking off (screeding)
   3. Edging and jointing
   4. Floating
   5. Final finishing
      a. Broom finish
      b. Burlap or belt finish
      c. Hand float finish
      d. Troweling
      e. Patterned, textured, colored, and exposed aggregate finishes

Activities

- Examine all tools.
- Visit a job site during pouring operation.
- Visit a job site during finishing operation.
- Pour slabs and use tools for various finishes.
- List various types of finishes found in vicinity of school.

XIII. Curing concrete

A. Effect of curing

B. Methods of curing
   1. Water curing
   2. Water retaining
   3. Mechanical barriers
   4. Chemical membranes

C. General requirements of curing

Activities

- Use various methods for curing the student-finished slabs and observe effects of each.

XIV. Joints and reinforcements for concrete

A. Necessity for joint

B. Placement of joint
   1. Isolation joint for point of abutment
   2. Predetermination of crack location
   3. Large areas placed in stages
   4. Combination control and construction joints

C. Kinds of reinforcement

D. How reinforcement works
   1. Factors influencing reinforcing
      a. Temperature and moisture
      b. Placement of steel
   2. Splicing reinforcement
   3. Slab reinforcement

E. General rules for steel reinforcement

F. New developments in reinforcement

Activities

- Place joints in student-finished slabs.
- Test effectiveness of different joints.
- Find examples of properly and improperly used joints in the homes, school, and community.

XV. Estimating concrete for jobs

A. Materials required for job batching

C

16711

B. Concrete estimating short cuts

C. Concrete calculator

XVI. Concreting in hot and cold weather

A. Special arrangements and precautions for hot weather
   1. Preventing rapid evaporation
      a. Temperature
      b. Relative humidity
      c. Wind
   2. Arrangements for placing concrete
   3. During and after concrete placement
   4. Use of admixtures

B. Special arrangement and precautions for cold weather
   1. Effect of concrete temperatures
   2. High-early-strength concrete
   3. Use of chemical accelerators
   4. Arrangements before placing concrete
   5. Arrangements after placing concrete
   6. Curing methods for cold weather

XVII. Job opportunities in the concrete industry

A. Construction outlook

B. Manpower requirements

C. Job opportunities
   1. Ready mixed concrete industry
   2. Precast concrete industry
   3. Concrete masonry and concrete products industry
   4. Construction industry
   5. Allied industries

D. Personnel requirements
   1. Type of individuals wanted
   2. Education and training

E. Other considerations
   1. Job stability
   2. Salary
   3. Opportunities for advancement
   4. Working condition

Masonry

I. Introduction

II. History

III. Manufacture of masonry units

   A. Brick

   B. Structural clay tile

   C. Concrete block

IV. Modular dimensions

   A. Unit designations

   B. Sizes and shapes

   C. Specification

V. Properties of masonry units

16712

VI. Tools and equipment

A. Tools
   1. Brick trowel
   2. Brick hammer
   3. Mason's rule
   4. Blocking chisel
   5. Plumb rule
   6. Mason's line
   7. Story pole and gage stick
   8. Trig

B. Equipment
   1. Mason's scaffold
   2. Mortar mixer

VII. Mortar and ties

A. Mortar
   1. Components
   2. Types (M, S, N, O, K)
   3. Masonry cement
   4. Uses for mortar types

B. Mixing mortar

C. Metal ties
   1. Types
   2. Uses

VIII. Masonry construction procedures and practices

A. Preparation of materials
   1. Brick
   2. Block
   3. Mortar

B. Workmanship
   1. Spreading uniform bed of mortar
   2. Taking care of excess mortar
   3. Placing closers
   4. Laying to a line
   5. Striking the joints

C. Flushing

D. Expansion joints

E. Protection of masonry
   1. From rain during construction
   2. From freezing during construction

16713

IX. Bonds, patterns, and texture

A. Terms applied to brick position
1. Stretcher
2. Header
3. Soldier
4. Shiner
5. Rowlock
6. Sailor

B. Bonds
1. Structural bonds
2. Pattern bonds
3. Mortar bonds

C. Mortar joints
1. Concave and V-shaped joint
2. Weathered joint
3. Rough cut or flush joint
4. Struck joint
5. Raked joint

Activities

- Observe different masonry patterns in the community.
- Observe different masonry joints in the community.
- Lay up different patterns with "Lego" blocks.
- Practice making different types of mortar joints.
- Plan small structures using different pattern bonds.

X. Reinforced brick masonry

A. Strength of masonry units and mortar
1. Forces involved
2. Strength ranges for compression, shear, and tension forces

B. Bending forces
1. Cantilever
2. Continuous beams

C. Reinforcing materials
1. Brick or tile
2. Steel
3. Mortar
4. Grout

D. Reinforcing methods
1. For steel
2. For grout

Activities

- View structural drawing of various reinforcing methods.
- Visit a reinforced brick masonry job site.
- Construct and test small reinforced and non-reinforced masonry structures.

XI. Masonry structures

A. Walls
1. Requirement for walls
2. Contemporary bearing wall
3. Exterior walls
   a. Brick veneer
   b. SCR brick wall
   c. Cavity wall
   d. Masonry bonded hollow wall
   e. Solid brick walls

B. Chimneys and fireplaces
1. Chimney construction
   a. Heights
   b. Support
   c. Corbeling
   d. Materials
   e. Liners
2. Connections
3. Chimney tops and flashing
4. Chimney test and repair
5. Fireplace types
   a. Single-face fireplace
   b. Multi-face fireplace
6. Parts of fireplace
7. Fireplace dimensions
8. Construction details

C. Arches
1. Arch forms
   a. Jack
   b. Segmental
   c. Multi-centered
   d. Tudor
   e. Roman or semicircular
   f. Gothic
   g. Parabolic

3. Arch construction — Temporary shoring or centering

D. Floors and pavements
1. Interior floors
   a. With mortar joint
   b. Mortarless brick floors
2. Exterior paving
   a. Drainage
   b. Edging
   c. Construction
3. Reinforced brick floors
4. Finishing and maintenance of brick floors

XII. Cleaning clay products masonry

A. Cleaning new masonry
1. Acid solution
   a. Dark brick
   b. Light colored brick
   c. Textured brick
   d. Glazed brick and tile
2. Proprietary cleaning compounds
3. Sandblasting

B. Removing efflorescence

C. Removing vanadium stain

D. Removing manganese stain

E. Removing externally caused stains
1. Poultice
2. Paint stain
3. Copper or bronze stain
4. Welding splatter
5. Smoke stains
6. Oil and tar stains
7. Plant growth
8. Stains of unknown origin

F. Cleaning existing masonry
1. High-pressure steam
2. Sandblasting
3. Hand washing
4. High-pressure cold water
5. Chemicals and steam
6. Wet sand cleaning
7. Wet aggregate cleaning

C

XIII. Estimating quantities of clay masonry

A. Estimating procedure
1. Wall area method
2. Mortar quantities

B. Use of modular materials tables

C. Rule of thumb

XIV. Job opportunities in masonry

A. Occupational outlook

B. Manpower requirements

16715

C. Job opportunities
   1. Brick and tile plants workers
   2. Bricklayers
   3. Stone masons
   4. Concrete block layers
   5. Others

D. Personnel requirements
   1. Type of individuals wanted
   2. Education and training

E. Other considerations
   1. Job stability
   2. Salary
   3. Opportunities for advancement
   4. Working conditions

- Make individual studies and reports from occupational information obtained from school counselor and community businessmen.

SELECTED INSTRUCTIONAL AIDS OR SOURCES

Only a limited amount of specific material is included here. Many entries are primarily for purposes of illustration. Sources that pertain to Construction Technology are included if specific material is not listed below. Additional information of a general nature may be found on page 48.

Miscellaneous Materials

Carpentry

An abundance of useful material can be secured from the following sources:

- American Forest Product Industries, Inc., 1816 N Street, N.W., Washington, D.C. 20036.
- California Redwood Association, 617 Montgomery Street, San Francisco, California 94111.
- Douglas Fir Plywood Association, Tacoma, Washington.
- Forest Products Laboratory, North Walnut St., Madison, Wisconsin 53705.
- National Lumber Manufacturers Association, Technical Service Division, 1619 Massachusetts Avenue, N.W., Washington, D.C. 20036.
- West Coast Lumberman's Association, 14105 Morrison Street, Portland, Oregon 97203.
- Western Wood Products Association, 700 Yeon Building, Portland, Oregon 97204.
- Weyerhaeuser Company, Tacoma Building, Tacoma, Washington, 98401.

Concrete Technology

- Booklet: "Portland Cement Association — What It Is and What It Does" (E 102)
- Booklet: "The Making of Portland Cement" (E 108)
- Chart: "Manufacture of Portland Cement" (E 112)
- Booklet: "Cement and Concrete Reference Book" (M 109)
- Single copies are available free, Portland Cement Association, Old Orchard Road, Skokie, Illinois 60076.
- Designation C31, "Standard Methods of Making and Curing Concrete Compression and Flexure Test Specimens in the Field."
- Designation C39, "Standard Method of Test for Compressive Strength of Molded Concrete Cylinders."
- Designation C149, "Standard Method of Slump Test for Consistency of Portland Cement."

16716

- Designation C172, "Stand Method of Sampling Fresh Concrete."

  The above publications and others are available at a nominal price, American Society for Testing and Materials, 1916 Race Street, Philadelphia, Pennsylvania 19103.

- ACI 347, "Recommended Practice for Concrete Formwork"

- ACI 604, "Recommended Practice for Winter Concreting"

- ACI 605, "Recommended Practice for Hot Weather Concreting"

- ACI 613, "Recommended Practice for Selecting Proportions Concrete"

- ACI 614, "Recommended Practice for Measuring, Mixing, and Placing Concrete"

- Special Publication SP-1, "Concrete Primer"

  Available at a nominal price from the American Concrete Institute, Box 4754, Redford Station, Detroit, Michigan 48219.

Other publications are available from the following sources:

- National Ready Mixed Concrete Association, 900 Sprint Street, Silver Spring, Maryland 20910.

- Expanded Shale, Clay and Slate Institute, National Press Building, Washington, D.C. 20004.

- National Academy of Sciences — National Research Council, 2101 Constitution Avenue, N.W., Washington, D.C. 20037.

Masonry

- Technical Notes: Monthly reports on latest technology of structural clay products are available through SCPI. A complete list of all Technical Notes is also available. Structural Clay Products Institute, 1750 Old Meadow Road, McLean, Virginia 22101.

- Posters: Essentials of Good Brick and Tile Construction — A series of six posters which give step-by-step explanation of good bricklaying workmanship. Structural Clay Products Institute, 1750 Old Meadow Road, McLean, Virginia 22101.

Slides

Carpentry

- 35mm teacher-prepared slides from construction site visitations.

Concrete Technology

- The PCA slide set, *Mr. Quality Concrete,* consisting of 40, 2"x 2" color slides is available at a cost of 25 cents per slide from the Portland Cement Association, Old Orchard Road, Skokie, Illinois 60067.

Masonry

- "Classification and Manufacture of Structural Clay Products," (Use in Unit 1).

- "Contemporary Bearing Wall."

- "Selection of a Building Wall."

- "SCR Insulated Cavity Wall."

  The above lecture slides may be borrowed or purchased from the Structural Clay Products Institute (SCPI), 1750 Old Meadow Drive, McLean, Virginia 22101.

Transparencies

The following is a list of companies that are producing transparencies. They should be contacted directly to obtain a complete list of such materials.

- Charles Beseler Company, 219 South 18th Street, East Orange, New Jersey 07018.

- DCA Educational Products, Inc., 4865 Stenton Avenue, Philadelphia, Pennsylvania 19144.

- Jam Handy Organization, 2821 East Grand Boulevard, Detroit, Michigan 48211.

- *Recommended Practice for Laying Concrete Block,* Portland Cement Association, Skokie, Illinois 60076, 1963.

C

EQUIPMENT

Carpentry

Few tools and equipment will be needed in addition to what would be available in a well-equipped unit wood shop. See pages 172 to 175 for such recommendations.

Concrete Technology

A partial list of tools, equipment, and materials which are required to do concrete work is as follows:

Tools and equipment

Glass bottles for silt test
Set of laboratory sieves
Pocket-size air indicator
Slump cone, rod and rule
Compressive test mold
Hydraulic press
Small concrete mixer
Straight edge or strick-off rod
Hand tamper
Darby
Bull float
Edgers (several different sizes and types)
Jointers or groover (several different bits depths)
Hand floats (wood and magnesium)
Steel hand trowel (several sizes)
Concrete calculators

Materials

Aggregate samples
Portland Cement — Type I and I-A
Air-entraining mixture (sample of sand)
Releasing agents (samples of)
Reinforcing rods and mesh (samples of)
Wood for building forms

Masonry

A partial list of tools, equipment, and material which are unique to masonry is as follows:

Tools and Equipment

Brick tongs
Mortar stands
Wheelbarrow
Mortar mixing box
Water hose
Shovels (#2 Flat and round point)
Masonry saw
Mortar mixer
Bricklaying trowels
Plastering trowels
Pointing trowels
Brick hammers
Plumb rule (48")
Spacing rule

16719

Brick set
Mason's line
Line pins
Line trigs
Line blocks
Jointers, convex
Raker jointer
"V" jointer
Plumb bob
Steel measure (50')

Materials

Facing brick
Hydrated lime
Mason sand
Steel lintels
Wall ties
Structural clay facing tile

SUPPLIERS OF TOOLS AND EQUIPMENT

- Broadhead-Garrett Company, 4560 East 71st Street, Cleveland, Ohio 44105.
- Midwest Shop Supplies, Inc., 301 Jackson Street, Sioux City, Iowa 51101.
- Paxton Equipment and Supply, 7401 South Pulaski Road, Chicago, Illinois 60629.
- Satterlee Company, 2200 East Franklin, Minneapolis, Minnesota 55404.

16720

WS. 42. Gun Rack: Make a two-view dimensioned instrument drawing of the Gun Rack. Use the scale 1/8" = 1". Show front and right end views. Make a freehand plan and have it checked before making the instrument drawing.

DRAFTING

16721

69

Drafting has been called a universal language because products of the drafting room can be understood rather well by industrialists in any quarter of the globe regardless of their ability to understand the mother tongue of the draftsman who produced the drawing. This area, in which students learn to visualize, express their own ideas graphically, and interpret ideas of others, is essential to the understanding of today's modern industry.

Certain basic drafting principles could be introduced at the elementary level. Using sketching to make simple pictorial or view drawings would provide pupils with another means of communication which could be used to advantage in reducing abstractions.

Drafting makes important contributions in junior high school industrial arts programs by providing introductory experiences in graphic communication including basic drafting principles, design and planning of projects, and the like.

At least two years of sequential coursework in drafting should be available at the senior high school level. At this level drafting is carried out in a drafting room with such specialized equipment as drafting tables, instruments, drafting machines, and reproduction machines. Courses such as engineering drafting and architectural drafting may be taught in addition to one or more basic courses. Course work at this level, despite the high degree of proficiency attained by some students, should not be considered as training for earning a wage.

Drafting offers rich opportunities to apply mathematics. Design activities have much potential for utilizing scientific principles and other aspects of general education.

This area is appropriate for girls and any interest they have in it is usually accompanied by considerable aptitude.

If additional courses are offered on the junior high school level, instruction should progress into more specific types of drawings, print reading, dimensioning, project planning, use of instruments, and drawing reproduction.

The instructional content should include what is presented in this guide in so far as the local schedule will allow. It is strongly recommended that the student experience the processes outlined here by the time he completes the ninth grade so that he will be prepared for further instruction in drafting.

The order of units in this outline is not intended to interfere with flexibility in the sequence of presentation. Likewise, the extent of class involvement with each unit is dependent on the individual situation. It is hoped that the teacher will supplement the material with pertinent information relative to the needs of his students and the changing conditions of our industrial society.

Objectives. Every student should have the opportunity:

- To develop an awareness of the purpose of drafting in industry; its place in design, production, and distribution.
- To develop the ability to use drafting techniques in the solution of common problems.
- To develop the ability to communicate through graphic production and interpretation.
- To develop basic skills, knowledge, work habits, and attitudes which will be of value in further work in industrial arts and other subject matter areas.
- To realize personal interests and abilities in drafting and gain some understanding of the occupational opportunities in this field of work.

Drafting for Junior High Schools (7-9)

The first course or unit in drafting should be devoted to developing fundamental concepts. No attempt should be made to develop a high degree of skill or depth of knowledge in the field. An emphasis should be placed on sketching, measurement, view construction and interpretation, and the significance of drafting in industry.

Content. Part One of the outline deals with fundamental concepts of drafting through the sketching approach. In Part Two the use of instruments is employed to provide more depth in these concepts and to introduce additional concepts. No attempt has been made to identify specific courses. The instruction may be accomplished in a single course or in several shorter courses depending upon the local scheduling arrangements. So many good

16722

D

sources for student activities in drafting are available in textbooks and professional journals that none are included here.

Part One — Sketching and Fundamentals of Drafting

I. General introduction to drafting — Grades 7-9

- A. Objectives of drafting
- B. Course content
- C. History of drafting
- D. Drafting as communication
- E. Drafting as problem solving
- F. Opportunities in drafting
- G. Safety precautions
  1. Pointed instruments
  2. Reproduction solutions

II. The sketching process

- A. Value and uses of sketching
- B. Materials and tools
  1. Graph paper
  2. Sketch pad
  3. Soft pencil
  4. Eraser
- C. Techniques
  1. Straight lines
  2. Curves, circles, arcs
  3. Border and title layout

III. Lettering

- A. Gothic single stroke
  1. Vertical
  2. Inclined
- B. Proportion
- C. Spacing

IV. Pictorial sketching

- A. Oblique
  1. Cavalier
  2. Cabinet
- B. Isometric
- C. Perspective
  1. 1 point
  2. 2 point

V. Multiview Sketching

- A. Principles of shape description
- B. Visualization
- C. Layout and arrangement of views

VI. Dimensioning

- A. Measuring full scale
- B. General rules
- C. Alphabet of lines
- D. Basic techniques

Part Two — Instrument Drafting

I. Introduction to common tools and materials

- A. Board
- B. T-square, parallel rule, drafting machine
- C. Triangles
- D. Architect's scale
- E. Pencils, erasers, erasing shields
- F. Compasses, bow instruments, templates
- G. Irregular curves
- H. Drafting papers and other media

II. Measuring

- A. Techniques
- B. Inches and fractional parts
- C. Decimal conversions
- D. Metric system

16723

E. Common mathematical computations

F. Drawing to scale

III. Drafting techniques

A. Proper care and use of instruments

B. Techniques of penciling straight lines, circles, arcs, and curves

C. Angles, intersections

IV. Drawing layout

A. Sheet sizes and layout
1. Border
2. Record strip

B. Object drawing
1. Placements
2. Spacing
3. Neatness

V. Geometric constructions

A. Bisecting
1. Lines
2. Angles

B. Erecting perpendiculars
1. To a point on a line
2. From a point outside a line

C. Dividing a line into equal number of parts

D. Constructing tangents
1. Straight line to a circle
2. Arc to straight lines
3. Arc to circle

E. Constructing a pentagon, hexagon, agon octagon

F. Constructing ellipses

G. Others as needed

H. Single view drawings involving geometric constructions

VI. Orthographic projection

A. Preliminary sketching and visualization

B. Principals of shape description
1. View selection
2. Spacing of views
3. Projecting from view to view
4. Order of penciling
5. Correct use of hidden lines
6. Correct use of center lines

VII. Dimensioning

A. General rules and techniques

B. Lines, arrowheads, spacing

C. Lettering
1. Notes
2. Numerals
3. Mechanical aids

VIII. Sections

A. Full

B. Half

C. Line work and symbols

IX. Auxiliary views

A. Primary auxiliaries only

B. Use and location of reference planes

X. Graphs and charts

A. Bar graph

B. Line graph

C. Circle graph

D. Flow diagrams

XI. Project planning and design

A. Student design of a simple object

B. Application of techniques of sketching and drafting

C. Construction of a bill of material

XII. Review of reproduction processes

A. Blueprinting

D

16724

B. White printing
   1. Moist diazo
   2. Dry diazo

XIII. Print reading

A. Interpreting views and symbols

B. Locating and identifying specific information

Drafting for Senior High Schools (10-12)

Drafting at the senior high school level should serve several functions. It should serve to provide an introductory course for students who have not had previous drafting instruction and who wish to test their interest and ability in this field. To serve this function it would be well to offer a course patterned after the junior high school drafting outline in this guide.

Secondly, it should serve a general educational purpose in helping students in the development of their capacity to analyze, organize, and express themselves graphically in a precise, accurate manner; and to interpret ideas that have been expressed graphically by others.

In addition, it should serve a function of providing differentiating education for students who have an interest in a particular area of drafting or industrial occupations which rely on drafting as a means of communication.

Finally, it should serve a preparatory function for students who wish to equip themselves for gainful employment in drafting or who plan to continue their education in engineering or technical schools.

Objectives. Every student should have the opportunity:

- To develop further the fundamental concepts of drafting which were established in junior high school drafting.
- To explore special areas or phases of drafting.
- To develop an appreciation of the importance of drafting in a technological world and an awareness of its opportunities and requirements as a vocation.
- To express himself through creative work and to develop an appreciation for quality in design and craftsmanship.
- To develop knowledge, skill, and judgment in industrial drafting practices to the fullest extent of his interest and ability.
- To realize the value of mathematics and science in the solution of graphical problems.

Content. It is recognized that local situations may justify modification of course titles, sequence of instruction, and extent of student involvement in the outline presented here. Four courses, general drafting, machine drafting, engineering-technical drafting, and architectural drafting, are presented in the following outline.

The teacher should recognize this as a guide and draw from it those portions which best fit his students and teaching situation. It is highly recommended, however, that the content outlined here be covered in courses of comparable purpose.

Since appropriate student activities for this area are so readily available in textbooks and professional journals none are included here.

General Drafting (1-2 semesters)

I. Review of basic fundamentals

A. Equipment
   1. Names, purposes, quality
   2. Uses, care

B. Materials
   1. Names, purposes, quality
   2. Uses, care

C. Basic procedures
   1. Sketching pictorials
   2. Freehand lettering
   3. Use of instruments
   4. Drafting geometry
   5. Techniques of producing a drawing

D. Dimensioning
   1. Lines, arrowheads, notes, and numerals
   2. Placement
   3. Techniques
      a. Circles, arcs, angles, cylinders
      b. Restricted space dimensioning

16725

4. Decimals, fractions
5. Metric system

II. Multiview projection

A. Working drawings
1. Orthographic
a. Techniques of projection
b. Related lines and symbols
c. Dimensioning and basic toleranc-ing
2. Detail and assembly drawing
a. Purposes of each
b. Characteristics of each

B. Sections
1. Full, half, offset
2. Assembly sections
3. Broken out, revolved, removed
4. Related lines and symbols

C. Auxiliary views and revolutions
1. Projection of primary auxiliaries
a. Inclined surfaces
b. Curved surfaces
2. Related lines and symbols
3. Revolutions in true length line de-termination

III. Sheet metal developments

A. Rectangular or simple line developments

B. Parallel line

C. Radial line

D. Related lines and symbols

IV. Electronic drafting

A. Wiring diagrams

B. Schematics

C. Related lines and symbols

V. Map drafting

A. Plots, plats

B. Topographic maps, weather maps

C. Others

D. Related lines and symbols

VI. Architectural sketching

A. Simple floor plans

B. Simple evaluation

C. Basic dimensioning

D. Related lines and symbols

High school drafting equipment.

D

Machine Drafting (1-2 semesters, grades 11-12, prerequisite: General Drafting)

I. Review of basic techniques

A. Lettering

B. Line work

C. Procedure for developing a drawing

II. Orthographic projection

A. Planes of projection

B. First and third angle projection

C. Partial views

16726

D. Shop processes
   1. Cutting and shearing
   2. Bending and forming
   3. Drilling, boring, reaming
   4. Turning, shaping, milling
   5. Heat treating and welding
   6. Surface finishing

III. Dimensioning practices

A. Special rules

B. Limits and tolerances

C. Decimal system

D. Metric system

E. Unilateral and bilateral tolerance system

F. Description of standard fits

G. Dimensioning for standard fits

H. Positional tolerances

I. Surface finish specifications

IV. Auxiliary views and revolution

A. Partial and complete views

B. Type of primary views

C. Secondary auxiliaries

D. Revolutions

V. Fasteners

A. Classification of fasteners

B. Symbolic forms

C. Dimensions and specifications

D. Use of templates

VI. Production drawings

A. Detail drawings
   1. Pattern shop
   2. Weldments
   3. Machine
   4. Stampings

B. Assembly drawings
   1. General
   2. Design layout
   3. Sub-assemblies
   4. Sub-weldments

C. Material lists
   1. Placement and information included
   2. Keyed to drawings

D. Application of dimensions
   1. Detail drawing
   2. Assembly drawing

E. Corrections and revisions

F. Use of sectioning
   1. Basic applications
   2. Conventional practices

VII. Reproduction of drawings

A. Processes
   1. Moist diazo
   2. Dry diazo
   3. Thermo
   4. Xerography
   5. Microfilming

B. Materials
   1. Papers
   2. Plastic films
   3. Cloth

C. Techniques of use
   1. Original copy
   2. Intermediate copies
   3. Reproducing opaque originals
   4. Scissor editing
   5. Photographic

D. Safety precautions

VIII. Pictorial drafting

A. Types
   1. Oblique projections
   2. Isometric
   3. Perspectives

B. Related materials and equipment and their use
   1. Grid papers
   2. Templates
   3. Mechanical devices

16727

C. Applications
1. Exploded views
2. Shading and color
3. Dimensioning

Engineering-Technical Drafting (1-2 Semesters, Grades 11-12, Prerequisite: General Drafting)

I. Introduction

A. Purpose and scope of the course

B. Review of drafting techniques

II. Cams and gears

A. Types of gears

B. Gear representation, terminology, formulas, and dimensioning

C. Types of cams

D. Cam representation, terminology, profiles, motion diagrams, and dimensioning

III. Structural steel drafting

A. Conventions, dimensioning, notes, symbols

B. Mill tolerance

C. Fabrication
1. Right and left details
2. Simple square framed beams

D. Fasteners, rivets, bolts

E. Erection clearance for seated connections

F. Column details

G. Beam details

IV. Descriptive geometry

A. Points-location

B. Lines
1. True length
2. Slope, grade, bearing
3. Point view
4. Parallel and perpendicular
5. Shortest distance between
6. Visibility

C. Planes
1. Formation of
2. Strike
3. Dip
4. Edge view
5. True shape
6. Lines parallel and perpendicular to
7. Piercing point of line
8. Intersection of plane
9. Visibility
10. Dihedral angle

D. Revolutions
1. Point
2. Lines
3. Plane
4. True length of line
5. True shape of plane
6. Dihedral angle

E. Surface developments
1. Intersections of prisms, cylinders, pyramids, and cones
2. Truncated prisms, cylinders, pyramids, and cones
3. Transitions

V. Design problems

A. Simple machine design
1. Analysis and design
2. Working drawings or assembly drawings
3. Determination of weights, volumes, and cost of parts

B. Jigs, fixtures, tools, and dies
1. Definition and description
a. Principles of jig and fixture design
b. Tool drawings
c. Dies
2. Analysis and design
3. Working drawings or assembly drawings

VI. Recent developments

A. Simplified drafting
1. Elimination of unnecessary views
2. Sketched production drawings
3. Simplified sectioning, dimensioning notes, and symbols

D

16 728

B. Drafting for numerical controlled machines
   1. XYZ coordinates
   2. Base line dimensions

C. Geometric tolerancing
   1. Symbol identification
   2. Datum surfaces
   3. True position

D. Computorized drafting

E. Materials and tools
   1. Films and papers
   2. Overlays, appliques, tape lines
   3. Technical fountain pens and compasses
   4. Mechanical lettering devices
   5. Special templates

VII. Additional areas of specialization

A. Automotive drafting

B. Pipe drawing

C. Aircraft drafting

D. Electrical drafting

E. Photo drafting

Architectural Drafting (1-2 Semesters, Grades 11-12, Prerequisite: General Drafting)

I. Organization and orientation

A. History and background

B. Basic housing
   1. Community
   2. Types
   3. Materials
   4. Construction and design

C. New trends in housing
   1. Prefabricated
   2. Design for flexibility
   3. Styling
   4. New materials and procedures

II. Planning

A. Area planning
   1. Living area
   2. Service area
   3. Sleeping area
   4. Basement area

B. Lot and grounds
   1. Lot location
   2. Size and contour
   3. Plantings
   4. Natural setting
   5. Soil structure
   6. Driveways and walks

C. Elevations
   1. Style of house
   2. Size of house
   3. Exterior design

D. Electrical
   1. Outlets, switches, fixtures
   2. Symbols
   3. Building codes
   4. Built-in appliances

E. Plumbing
   1. Symbols
   2. Building codes
   3. Water system, sewer system
   4. Bath floor plan
   5. Kitchen plan and plumbing details

F. Heating, cooling, and insulation
   1. Placement of heating and cooling units
   2. Forced air systems
   3. Electrical systems
   4. Water systems
   5. Steam systems
   6. The heat pump
   7. Fireplaces — conventional and prefabricated
   8. Insulation — functions, types, placement
